Motivation

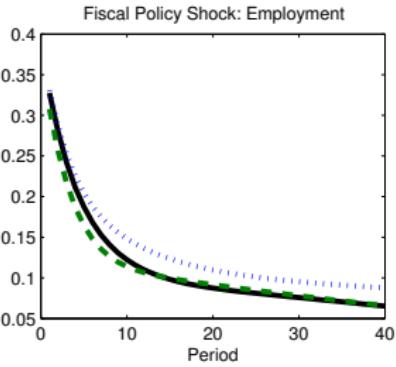

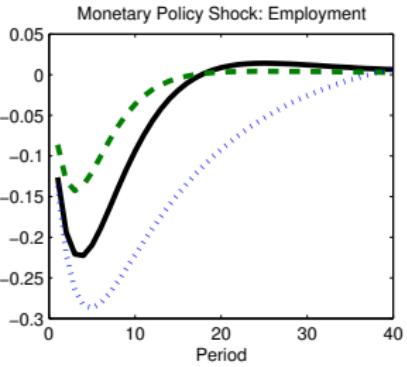

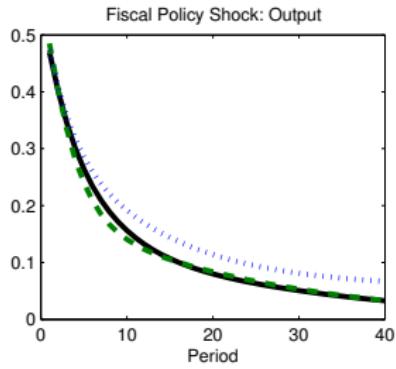

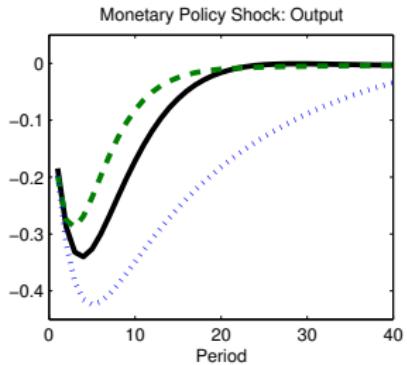

Figure: Unemployment after Volcker Disinflation

Motivation

- Question
 - ▶ Do states with high wage rigidity experience deeper impact of policy shocks?
 - ▶ ⇒ wage rigidity prevents price/cost reduction which amplifies the effect of demand shocks
- Strategy:
 - ▶ Calculate *downward* wage rigidity by state and year from micro data
 - ▶ Obtain national shocks in monetary and fiscal policy
 - ▶ Explain variation in state-level impact of policy shocks using rigidity measures

Theory: IRFs to MP Shock, Smets and Wouters (2007)

Motivation

- Our focus on the United States:
 - ▶ Fiscal and monetary union: regional impact of nationally-generated shocks.
 - ▶ Monetary union: exchange rates do not form a channel of automatic stabilization within the union.
 - ▶ States are relatively homogeneous: for instance in a legislative and institutional sense \implies less sensitive to omitted variable bias than cross-country.
 - ▶ Data on wage rigidities collected in exactly the same way.

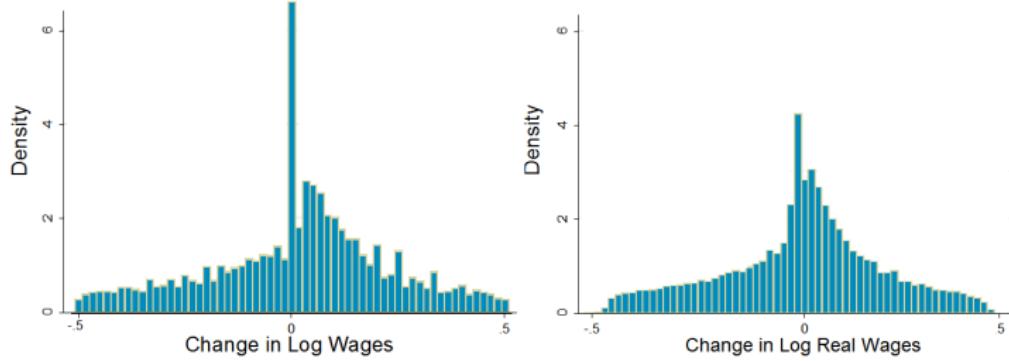

Micro Data on Wages

- Micro data from the Current Population Survey (CPS) between 1979 and 2014.
- Wage-change data for approximately 1.37 million Americans: an average of 838 observations per state per year.
- Randomly selected.
- Legally required to respond for 8 months.
- Applying Madrian and Lefgren (1999) procedure to validate panel matches.

CPS Structure

Distribution of Wage Changes 1980-2014

Figure: Distribution of Wage Changes in CPS micro data 1980-2014

- Define wage hourly (wage or salary/hours)
- Calculate log change: $\Delta \text{wage}_{i,s,t} = \ln(\text{wage}_{i,s,t}) - \ln(\text{wage}_{i,s,t-1})$

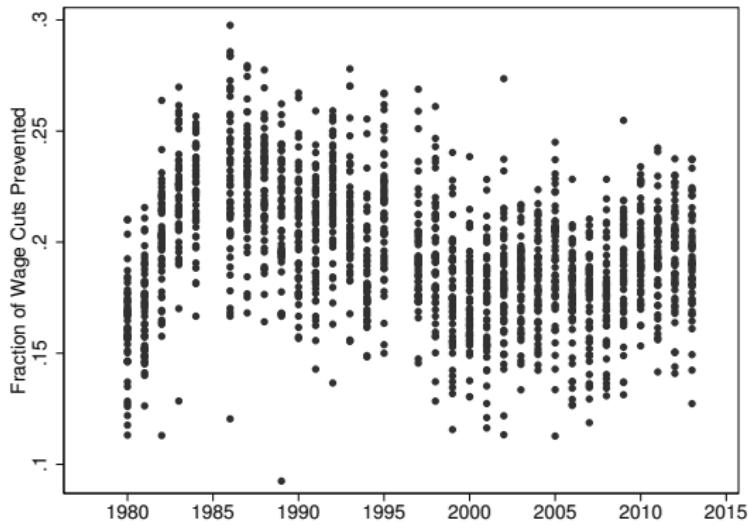

Measures of Downward Rigidity

- Measures for rigidity by Dickens et al. (2007), developed as part of the IWFP
- Fraction of Wage Cuts Prevented (FWCP)
- The FWCP compares the number of nominal wage freezes to the number of nominal wage cuts:

$$FWCP_{t,s}^n = \frac{f_{t,s}^n}{f_{t,s}^n + c_{t,s}^n}$$

Downward Real Wage Rigidities

Figure: Distribution of Downward Nominal Wage Rigidities, 1980-2014

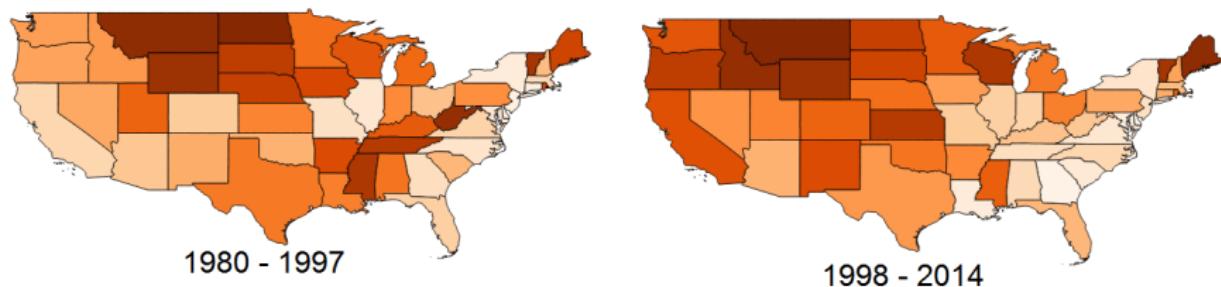

Note: 1985 and 1996 are dropped due to missing panel identifiers.

Average DNWR by States

Regions Don't Drive Rigidity

R ²	0.071	0.018	0.042	0.084

Note: *, **, *** denote significance at the 10, 5, and 1%, respectively. Clustered standard errors (by state) in parentheses.

Estimates obtained using Fixed Effects estimators.

Non-stationary variables estimated in first difference.

Sample: 1980-2013.

Estimation Equation

- Use rigidity estimates to explain variation in impact of monetary policy shocks.
- Standardize rigidity measure: lowest value per year = 0, highest value = 1.
- Main estimations: Local Projection Method (Jordá, 2005) in a panel STLPM:

$$y_{s,t+h} = F(z_{s,t}) (\alpha_h^R + \beta_h^{R'} x_{s,t} + \gamma_h^R i_{s,t}) + \\ (1 - F(z_{s,t})) (\alpha_h^F + \beta_h^{F'} x_{s,t} + \gamma_h^F i_{s,t}) + \phi'_h c_{s,t} + \eta_{s,t+h}, \quad (1)$$

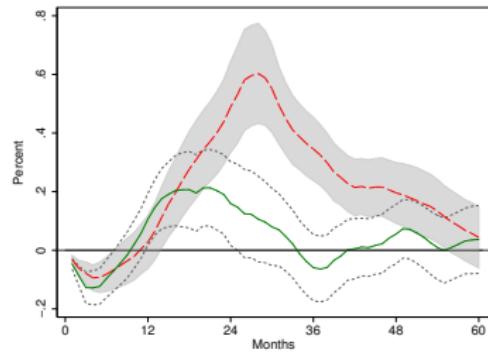

- $y_{s,t}$ = measure of economic activity (unemployment, coincident, GDP). CI
- $F(z_{s,t})$ = probability of being in rigid state $\in [0, 1]$.
- $i_{s,t}$ = Romer and Romer (2004) monetary policy shocks, monthly.
- $x_{s,t}$ = controls: lags of $i_{s,t}$, $y_{s,t}$, FFR, labor market controls.

Romer and Romer (2004) Shocks

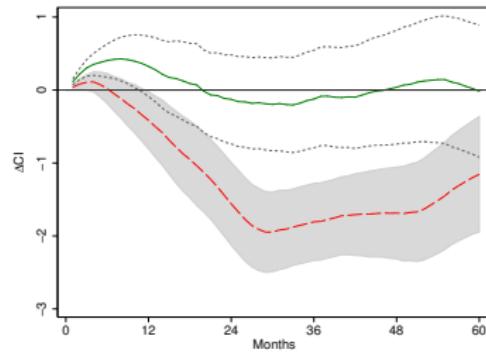

- Derive intended FFR changes from narrative minutes of FOMC meetings between 1981 and 2008
- Regress intended changes on changes in internal (Greenbook) forecasts
- Shocks: defined as divergence from standard response (errors in regressions)
- Robustness: Announcement shocks from Gertler and Karadi (2015) and Gorodnichenko and Weber (2016).
- Robustness: Exclude Volcker Disinflation

Results: Standardized Rigidity Measures

Figure: Monetary policy shocks in Rigid and Flexible States, 1980–2008

(a) Unemployment Rate

(b) Coincident Index

Note: Rigid state in red dashed line; Flexible state in green solid line. 90% intervals.

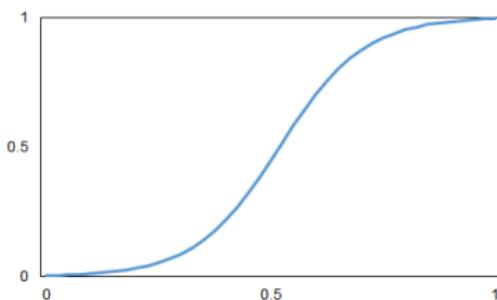

Unconditional IRFs

Outlier Treatment: Logistic Transformation Rigidity

- Follows Auerbach and Gorodnichenko 2012, Ramey and Zubairy, 2014:

$$F(z_{s,t-1}) = \frac{\exp[\xi \frac{z_{s,t-1} - c_z}{\sigma_z}]}{1 + \exp[\xi \frac{z_{s,t-1} - c_z}{\sigma_z}]}$$

Fiscal Shocks

- State-level spending: Endogenous!
- Instrument spending à la Nakamura and Steinsson (2014)
- 1st stage:

$$\Delta\mu_{s,t} = \phi_s + \beta_2\Delta\mu_t^{nat} + \beta_3\phi_s \cdot \Delta\mu_t^{nat} + \nu_{s,t} \quad (2)$$

- 2nd stage: estimate multipliers conditional on wage rigidity:

$$\begin{aligned}\Delta y_{s,t} = & F(z_{s,t}) (\alpha_h^R + \beta_h^{R'} x_{s,t} + \gamma_h^R \Delta\hat{\mu}_{s,t}) + \\ & (1 - F(z_{s,t})) (\alpha_h^F + \beta_h^{F'} x_{s,t} + \gamma_h^F \Delta\hat{\mu}_{s,t}) + \phi'_h c_{s,t} + \eta_{s,t},\end{aligned} \quad (3)$$

- Calculate Open Economy Relative Multiplier conditional on DWR

Results: Fiscal Shocks

Table: 2SLS Estimates of Military Expenditure Multiplier and Wage Rigidity

	(1)	(2)	(3)	(4)	(5)

R-squared	0.229	0.381	0.225	0.360	0.404

Note: *, **, *** denote significance at the 10, 5 and 1% level, respectively.

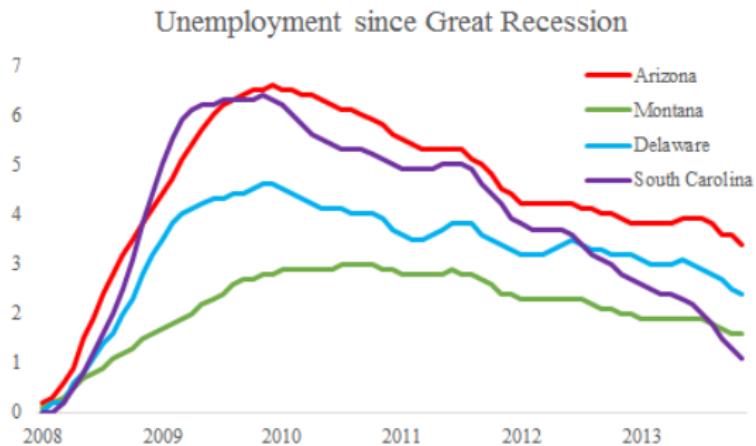

Estimates obtained using 2SLS. Standard errors are in parentheses,
clustered by state. Dependent variable is two-year growth in state GDP.

Concluding remarks

- We calculate yearly measures of DNWR for U.S. states and study regional impact of national shocks.
- Significant differences in state-level rigidity, shifts over time.
- States that have higher DNWR face greater unemployment and economic activity effects of policy shocks.
- In line with role of wages in New Keynesian DSGE models.
- Flexible state: multiplier < 0 , Rigid state: multiplier > 2 .

Coincident Index

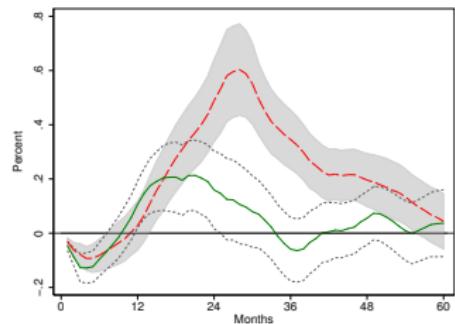

- Only monthly indicator of state-level activity, from Philadelphia Fed (see, Crone and Clayton-Matthews, 2005)
- Seasonally adjusted
- Combines 4 components in 1 index:
 - ▶ Nonfarm payroll employment
 - ▶ Avg. hours worked in manufacturing
 - ▶ Unemployment rate
 - ▶ Real salary disbursements
- Highly correlated with BEA quarterly state GDP > 2004
