Survey of Consumer Finance; CPRC research

## Overview of paper

- Motivation: Unusual time period
- Near-zero interest rates for most bank accounts that provide checking services
- Consumers have more payment instruments than ever before
- Research strategy:
- New panel microdata on payment instrument use (SCPC)
- Estimate econometric model similar to Mulligan and Sala-i-Martin (2000), Lippi and Secchi (2009)
- Key results:
- Small interest elasticity of cash demand at low interest rates
- Credit card debt appears to have a significant effect on the interest elasticity of cash demand
- Withdrawal location (heterogeneity in transactions cost) has highly significant (level) effects (Lippi and Secchi (2009))

## Selected literature

- Basic money demand model
- Baumol(1952, QJE)-Tobin (1956, REStat); extended for credit card use: Sastry (1970, JoF) and Lewis(1974, JoF)
- Other extensions of BT model:
- Alvarez and Lippi (2009, Econometrica), Miller and Orr (1966, QJE)
- Microeconometric studies of cash demand:
- Mulligan and Sala-i-Martin (2000, JPE), Attanasio et. al. (2002, JPE), Lippi and Secchi (2009, JME), Stix (2004, Empirica), Daniels and Murphy (1994, JMCB), Duca and Whitesell (1995, JMCB), Reynard (2004, JME)
- Time-series estimation of money demand:
- Lucas (2000, Econometrica), Ireland (2009, AER), many others
- Welfare cost of costly credit:
- Gillman (1993, JME), Lacker and Schreft (1996, JME), Ireland and Dotsey (1995, JME), Khan, King and Wolman (2003, REStud)
- Search theoretic models of cash and credit use:
- Telyukova and Wright (2008, REStud), Telyukova and Visschers (forthcoming, JME)

## BT model with credit cards (Sastry 1970)

$$
\begin{gathered}
\bar{M} \\
\text { m.t. } \quad M=\frac{\bar{M}^{2}}{2 W}, \quad D=\frac{(W-\bar{M})^{2}}{2 W}, \quad R^{c c}>R \\
W=\left(\frac{2 b C}{R}\right)^{\frac{1}{2}}\left(\frac{R^{c c}}{R+R^{c c}}\right)^{\frac{1}{2}}, \\
M=\frac{W}{2}=\left(\frac{b C}{2 R}\right)^{\frac{1}{2}}\left(\frac{R^{c c}}{R+R^{c c}}\right)^{\frac{1}{2}} \\
\log \left(M_{i}\right)=\frac{1}{2} \log \left(\frac{b}{2}\right)+\frac{1}{2} \log \left(C_{i}\right)-\frac{1}{2} \log \left(R_{i}\right)+\frac{1}{2} \log \left(\frac{R_{i}^{c c}}{R_{i}+R_{i}^{c c}}\right)+\epsilon_{i}
\end{gathered}
$$

## Interest elasticities in the model with credit cards

$$
\begin{aligned}
M & =\left(\frac{b C}{2 R}\right)^{\frac{1}{2}}\left(\frac{R^{c c}}{R+R^{c c}}\right)^{\frac{1}{2}} \\
\frac{\partial \log (M)}{\partial \log (R)} & =-0.5\left[1+\frac{R}{R+R^{c c}}\right]
\end{aligned}
$$

## Survey of Consumer Payment Choice

- Annual internet survey of U.S. adults
- Representative sample from the American Life Panel
- Consumer choices of common payment instruments
- Adoption of instruments
- Use of instruments (number of payments)
- Limited tracking of bank accounts
- No data on credit card interest rates
- But outstanding balance on credit cards is recorded!
- Part of the surveys asks about cash management:
- Typical (modal) amount of cash withdrawn
- Typical (modal) frequency of withdrawals
- Location most frequently used (mode) for withdrawals
- Actual amount of cash they have in their cash, wallet and purse
- Unbalanced longitudinal panel 2008-2010 (data for 2011-2013 to be released soon)
- Interest rates from the Bank Rate Monitor data set

## Estimation sample composition

- Unbalanced panel, respondents appearing in 1, 2 or 3 years
- Estimation: Cash demand with control for self-selection
- First-stage: Random-effects probit for adoption of interest-bearing checking account and credit card
- Second-stage: OLS with bootstrapped standard errors (1,000 replications, bootstrapping individuals instead of observations).

|  | \# of observations by year |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | 2008 | 2009 | 2010 | Total |
| Full SCPC sample | 1,010 | 2,173 | 2,102 | 5,285 |
| Estimation sample | 561 | 788 | 1,091 | 2,440 |
|  | \# of respondents |  |  |  |
| \# of respondents in 2008 only | 166 |  |  |  |
| \# of respondents in 2009 only | 190 |  |  |  |
| \# of respondents in 2010 only | 421 |  |  |  |
| \# of panel respondents 2008 and 2009 | 72 |  |  |  |
| \# of panel respondents 2008 and 2010 | 144 |  |  |  |
| \# of panel respondents 2009 and 2010 | 347 |  |  |  |
| \# of panel respondents 2008-10 | 179 |  |  |  |

## Bank account and payment card adoption

## Alternative cost of holding cash

| Commercial banks |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Thrifts |  |  |  |  |  |
| checking | mmkt. | Checking | mmkt. | costunity |  |
|  | $R^{c h, c b}$ | $R^{m m, c b}$ | $R^{c h, t h}$ | $R^{m m, t h}$ | $\tilde{R}$ |
| 2008 | 0.118 | 0.342 | 0.641 | 0.729 | 0.418 |
|  | $(0.050)$ | $(0.196)$ | $(0.180)$ | $(0.481)$ | $(0.336)$ |
| 2009 | 0.064 | 0.155 | 0.222 | 0.413 | 0.179 |
|  | $(0.026)$ | $(0.087)$ | $(0.109)$ | $(0.199)$ | $(0.161)$ |
| 2010 | 0.065 | 0.144 | 0.127 | 0.281 | 0.124 |
|  | $(0.026)$ | $(0.073)$ | $(0.038)$ | $(0.122)$ | $(0.099)$ |

- BRM dataset reports the average interest yields of various account types at the state level $\left(R_{i t}\right)$
- Daniels and Murphy (1994) aside, microeconometric studies of U.S. money demand do not have/use interest rate data
- SCPC contains information on the adoption of these accounts ( $\mathcal{I}_{\text {it }}=1$ if adopted, 0 otherwise) and on the state of residence of respondents
- The lowest interest rate available to the respondent is taken as the alternative cost ( $\tilde{R}$ )

$$
\tilde{R}_{i t}=\min \left(R_{i t}^{c h, c b} \mathcal{I}_{i t}^{c h, c b}, R_{i t}^{m m, c b} \mathcal{I}_{i t}^{m m, c b}, R_{i t}^{c h, t h} \mathcal{I}_{i t}^{c h, t h}, R_{i t}^{m m, t h} \mathcal{I}_{i t}^{m m, t h}\right)
$$

## Econometric model: Adoption equations

$$
\begin{gathered}
z_{i t}^{*}=\theta_{0}+\theta_{1} \cdot Y_{i t}+\theta_{2} \cdot \text { wealth }_{i t}+\theta_{3} R_{i t}+\theta_{4}{ }^{\prime} \mathbf{X}_{\mathbf{i t}}+ \\
\theta_{5}{ }^{\prime} \text { assessments } s_{\mathbf{i t}}+c_{i}+\varepsilon_{i t} \\
z_{i t}= \begin{cases}1 & z_{i t}^{*}>0 \\
0 & z_{i t}^{*} \leq 0\end{cases}
\end{gathered}
$$

- We estimate the adoption equations for interest-bearing bank account, credit card separately
- Both equations are estimated as RE probit models; the unobserved effect accounts for a large part of the variance of the composite error.
- assessments ${ }_{i t}$ and a dummy for homeownership are the omitted variables from the second-stage regression
- assessments ${ }_{i t}$ are self-reported ratings (1(worst)-5(best) likert scale) of cost and acceptance of payment instruments
- Average log differences are used in the regressions (to eliminate level differences across respondents)

## Adoption results

|  | Interest-bearing account |  | Credit card |  |

## Econometric model: Cash demand

$$
\begin{aligned}
\log \left(M_{i t}\right)= & \beta_{1} \log \left(Y_{i t}\right)+\beta_{2} \log \left(\text { Cash share }_{i t}\right)+\beta_{3} \log \left(R_{i t}\right)+ \\
& \beta_{4}\left[\log \left(R_{i t}\right) \times \text { revolver }_{i t}\right]+\beta_{5}\left[\log \left(R_{i t}\right) \times \text { branches }_{i t}\right]+ \\
& \mathbf{X}_{\mathbf{i t}^{\prime}}{ }^{\prime} \gamma+\rho^{\prime} \lambda_{\mathbf{i t}}+\epsilon_{i t},
\end{aligned}
$$

- We let the interest elasticity for revolvers and convenience users differ, exploiting that

$$
R_{i t}^{c c}=\left\{\begin{array}{cl}
0 & \text { if convenience user } \\
>0 & \text { if revolver }
\end{array}\right.
$$

- Demographic controls: age, gender, education, labor force, status, financial wealth; withdrawal location most often visited, time fixed-effects

Bootstrapped standard errors in parenthesis (1,000 replications).

* $p<0.10^{* *} p<0.05^{* * *} p<0.01$

## Is $\log ($ Cash share $)$ an endogenous regressor?

## GMM distance test

|  | Withdrawal amnt. |  | Avg. cash in wallet |  |
| :--- | :---: | :---: | :---: | :---: |
| $\log ($ Interest rate $)$ | -0.053 | $(0.035)$ | -0.051 | $(0.049)$ |
| $\log ($ Interest rate $) \times$ revolver | $0.113^{* * *}$ | $(0.042)$ | 0.087 | $(0.057)$ |
| $\log ($ Cash share $)$ | 0.153 | $(0.224)$ | -0.168 | $(0.361)$ |
| $\log ($ Income $)$ | $0.257^{* * *}$ | $(0.041)$ | $0.324^{* * *}$ | $(0.061)$ |
| $\log ($ Wealth $)$ | $0.069^{* * *}$ | $(0.017)$ | $0.086^{* * *}$ | $(0.023)$ |
| Hansen J-test | 1.927 | 2.814 |  |  |
| p-value | 0.381 | 0.245 |  |  |
| GMM distance | 0.003 | 1.103 |  |  |
| p-value | $\mathbf{0 . 9 5 4}$ | $\mathbf{0 . 2 9 4}$ |  |  |

Robust standard errors in parenthesis. ${ }^{*} p<0.10,{ }^{* *} p<0.05,{ }^{* * *} p<0.01$
$H_{0}: \log$ (Cash share) is exogenous

- Instrument for $\log$ (Cash share) with the self-reported assessment of security of and cost of cash relative to debit and credit cards
- GMM distance test shows that the IV model is not significantly different from the original model
- Hansen J-test validates the exclusion restriction

## Welfare Cost of Inflation

- Revolvers
-     - Combined cash demand
-     -         - Convenience users
-     - Joint estimate

## Conclusions and future research

- Conclusions:
- Plenty of heterogeneity across consumers'
- cash management
- bank account management
- Credit card debt has a significant effect on the interest elasticity of cash demand
- With the increase of revolving debt, the welfare implications of these effects becomes more important
- Future research topics:
- Extend estimation sample through 2013
- Long-run money demand (1984-86 vs 2008-2010/13)
- Money demand for unbanked
- Modeling of joint payment-borrowing decision for credit cards
- Generalized model of short-term liquidity management in 21st century

## Interest rates by states
