

T2S GENERAL TECHNICAL DESIGN V2.2

As announced in the AG meeting of 23 September 2009, the T2S Programme Board authorises the publication of the T2S General Technical Design (GTD) version 2.2, as prepared by 4CB. The basis for GTD v2.2 is URD v4.2 and for the sections on application design it is the recently published GFS v3.0.

The GTD aims at describing the T2S technical solution and encompasses the application design as well as the infrastructure design of the future platform. It also recalls the technical assumptions on which the 4CB have based these designs and it addresses some non-functional user requirements. Although the GTD is provided to T2S stakeholders for information purposes, the Eurosystem stands ready to organise a dedicated workshop with market participants during which 4CB can provide additional explanations about the technical design.

Yours sincerely

T2S Programme Board
