WHAT IS COMMERCIAL PROPERTY?: CONCEPTS AND CLASSIFICATIONS

PROFESSOR CHIHIRO SHIMIZU, REITAKU UNIVERSITY & UNIVERSITY OF BRITISH COLUMBIA

CPPH HANDBOOK 2ND DRAFT CHAPTER 4

PREPARATION OF AN INTERNATIONAL HANDBOOK ON COMMERCIAL PROPERTY PRICE INDICATORS

Frankfurt, 29-30 September 2014
1. CONCEPTS OF COMMERCIAL PROPERTY.

- Before considering property price indexes, let us first define "What Property is".
- Property is one of the most significant non-financial assets.
- What's more, its economic role changes depending on the entity that owns and uses it.
- Entities that “own” property are households, firms, and governments, and “use” differs for each one.
What is Property?

With regard to households, use centers on residential use. Households are an entity that consumes housing services. → One may assume that households change the usage method and amount owned in order to maximize utility.

Property owned by firms is one of the factors in producing goods and services. → Depending on the goods and services produced by the company, property may be used for various purposes, such as offices, commercial facilities, factories, medical facilities, warehouses, or hotels. Companies change the usage method and amount used in order to maximize their profit.

Governments use property that is required in order to produce public services. → The amount is determined in order to maximize utility for citizens of the state or local residents.
What is Property? SNA perspective.

- Dwellings (AN111)
- Other buildings and structures (AN112)
- Buildings other than dwellings (AN1121)
- Other structures (AN1122)
- Land improvements (AN1123)
- Land (AN211)

- Reproduced or not: Land (non-reproduced tangible assets) and Building (reproduced tangible assets).

- Activity: Market/non-market output and output for own final use.

- Use (residential, office, retail, industrial, etc.)

(3) DELINEATION OF COMMERCIAL PROPERTY IN BUSINESS SECTOR.

- The business sector classifies “*income-producing properties*” and “*own-use properties*”

- The business sector has a greater wealth of experience than the official statistics sector. For example, in the *property appraisal business*, appraisers determine prices based on three methods:

  - a) transaction comparison or comparable method,
  - b) cost method, (Land + Building).
  - c) capitalization method. (*income-producing properties*).

- Where mkt is strong, *transaction comparison method* will dominate, though *capitalization method & cost method* may also be used.

A: Rich transactions and income or rent data.
B: Poor transactions and rich income or rent data.
C: Poor transactions and income or rent data.
D: Strong regulation for conversion and transaction.
MARKET SIZE: CASE OF JAPAN.

REAL ESTATE ASSETS
2,489
- Land: 1,205
- Buildings: 1,284

Note: figures are trillions of yen

FINANCIAL ASSETS
5,715
- Cash & deposits: 1,288
  - Including 24 in foreign-currency deposits
- Investment assets
  - Traditional assets: 1,824
    - Domestic equities (listed): 320
    - Domestic bonds: 1,148
    - Foreign equities & bonds: 356
- Alternative assets
  - Real estate related assets
    - Investment trusts: 87
    - Structured-Financing Instruments (CMBS): approx. 7
  - Domestic equities (unlisted) & investments: 233
  - Derivatives: 91
- Other assets
  - Private financial institution lending: 682
  - Insurance & pension reserves & Deposits: 592
  - Natural resources
  - Intellectual properties & other assets

Debt financing: approx. 20
(NRL approx. 16)

Securitized Assets
approx. 31
(J-REIT approx. 8)

Investor Sector
- Households: 1,488
- Private corporations (non-financial): 786
- Institutional investors
  - Pension funds: 122
  - Insurance Companies: 373
- Banks: 1,523

Alternative assets
- Real estate related assets
  - Investment trusts: 87
  - Structured-Financing Instruments (CMBS): approx. 7

2. CLASSIFICATION OF COMMERCIAL PROPERTY.

- Commercial properties are very heterogeneous. Heterogeneity exists not only at the individual asset level, but at an aggregate level in populations of properties that effectively trade in distinct asset market segments.

- To construct useful CPPIs it is crucial to recognize this type of aggregate level heterogeneity and market segmentation, because different price dynamics can prevail across different market segments. Prices in one market segment might be rising at the same time those in another segment are falling. If you mix the two segments (or “populations”) together without care and attention, then you may think nothing is happening to prices in either market.
Asset classification in SNA perspective.

For buildings, the acquisition amount should be recorded as the economic value, but subsequently, “consumption of fixed capital”, “improvement of building”, and “demolition” are taken into consideration in estimating the economic value.

Therefore, when it comes to the categorization of these assets, one can see that it is necessary to perform estimation by distinguishing between assets with varying depreciation rates or curves.

Specifically, they must be classified based on property use (housing, office, commercial facility, factory, hotel, medical facility, etc.) and building structure (wooden, reinforced concrete, steel-reinforced concrete).

→ “Cost method” in business sector.
CLASSIFICATION IN BUILDING.

- Classification of types of construction.
  - 11. Residential buildings
    - 111. One-dwelling buildings
    - 112. Two- and more dwelling buildings
    - 113. Residences for communities
  - 12. Non-residential buildings
    - 121. Hotels and similar buildings
    - 122. Office buildings → Office
    - 123. Wholesale and retail trade buildings → Retail
    - 124. Traffic and communication buildings
    - 125. Industrial buildings and warehouses → Industrial
    - 126. Public entertainment, education, hospital or institutional care buildings
    - 127. Other non-residential buildings
PRODUCT CLASSIFICATION.

- The CPA (Statistical Classification of Products by Activity) 2008.
- Residential.
- Business.
- Industrial and warehouses.
- Agricultural.
- Non-residential properties include: factories, office, warehouses, theatres, multiple-use buildings that are primarily non-residential, agriculture, forestry properties, similar properties.
### CLASSIFICATION IN J-SNA.

- **Use × building structure**.

<table>
<thead>
<tr>
<th>Use</th>
<th>Building structure</th>

</tr>
</tbody>
</table>

(2) CLASSIFICATION IN BUSINESS SECTOR.

- Building usage type “sectors,” geographic location “markets,” and the perceived physical quality and/or size “class” of the individual properties.
- **Sectors**: offices, retail, industrial (including logistics) and rental residential.
- **Geographic Regions & Markets**: geographical divisions, within the metropolitan region or not, etc.
- **Property Physical Quality & Size Classes**: Class A (sometimes referred to as “prime” or “premium” or “institutional quality”) or Class B.
3. CLASSIFICATION OF J-CPPI

- In Japan, since the economic system is heavily reliant on land, there is a long history of estimating land asset amounts in official statistics.

- The survey on appraisal based property price indexes started in 1926.

- Land asset amounts were estimated in 1970 as a “National Wealth Statistic” and joined to the National Accounts (J-SNA).

- The “Corporations Survey on Land” begun in 1993 has companies declare the land they own and collects information on the land's address (location), size, and characteristics. In addition, a hedonic index is estimated using transaction price information and estimate “Land asset amounts” which owns by.
(1) CLASSIFICATION IN J-CPPI.

- CPPI’s for “Land with Structure”.
  - Retail
  - Office
  - Warehouse
  - Industry or Factory

- CPPI’s for “Land”.
  - Commercial
  - Industrial
