Climate change and monetary policy
Climate change posing physical and transition risks, depending on policy action

Climate risk scenarios: projections of carbon emissions and global warming
(emissions of CO2 in gigatonnes per year)

Note:

Baseline: In the absence of policies, global warming is expected to reach 4.1°C – 4.8°C above pre-industrial levels by the end of the century. The emissions that drive this warming are often called baseline scenarios.

Current policies in place around the world are projected to reduce baseline emissions and result in about 3°C warming above pre-industrial levels.

The “optimistic policies” scenario factors in additional as well as planned, but not yet implemented, policies and a continuation of recent developments.

The “2°C” consistent benchmark pathways are drawn from the “lower-2°C” and “high-overshoot 1.5°C” pathways in the new set of IAM pathways assessed in IPCC in its latest report.

The central “1.5°C compatible” benchmark is defined as the median of pathways that limit global warming to 1.7°C, or below.
Climate risks remain mispriced

Lack of common environmental standards slowing growth of green bond universe

Financial market pricing of climate risks: correlations of bank environmental scores

Share of IG green bonds in global gross issuance (in %, based on EUR data)

Source: ECB Financial Stability Review, November 2019 based on Bloomberg, Refinitiv EIKON, S&P Global Market Intelligence and Dealogic. Notes: The Bloomberg and Refinitiv environmental scores give values between 0 and 100, whereby a higher value indicates a better performance in terms of environmental variables. The full unbalanced sample consists of 49 banks and 23 insurers in the EU and the United States.
