FOREWORD

It is with great pleasure that I present this seventh edition of the publication entitled “European Union Balance of Payments/International Investment Position Statistical Methods” that has become familiar to its users as “the B.o.p. Book”.

Over the years, the B.o.p. Book has obtained a dual character. Initially, it served a benchmarking purpose whereby the countries implicitly set out plans for improvement by exposing their practices and their deviations from the agreed international standards. Gradually, however, the B.o.p. Book has also become a recognised reference document for external statistics (balance of payments and international investment position) compilation methods. Indeed, it brings together in a single volume on the one hand summary information on the requirements of the European Central Bank in the field of external statistics and on the concepts and methodology used in this area of statistics, and on the other hand detailed information on current practices in (no less than) 27 countries.

This book aims at enhancing the transparency of, and thereby the confidence in, these statistics. In addition, it is meant to serve the users that are interested in the external statistics of one of the largest economic areas in the world and compilers that would like to benefit from these documented experiences of the European Union countries.

Following the enlargement of the European Union on 1 May 2004, a major innovation in this release is the merger into a single volume of the so far separately published EU B.o.p. Book and the corresponding Manual of the Accession Countries. Hence, country chapters now cover the 25 EU Member States, as well as Bulgaria and Romania. While this is now a rather bulky document, its readability may have been improved by some improvements in the lay-out and the introduction of colour.

I would therefore like to very warmly thank all contributors, in particular in the Member States and the Accession Countries, for their active cooperation in this collective undertaking.

Frankfurt am Main, November 2004

[Signature]

José Manuel González-Páramo
Member of the Executive Board
I INTRODUCTION

Economic and monetary unions have a strong impact on the content and the economic interpretation of both national and aggregate balance of payments (b.o.p.) and international investment position (i.i.p.) statistics, as well as on other macroeconomic statistics.

Steps to harmonise definitions and concepts within the euro area are consistent with, but may exceed, the guidelines of international standards, which are sometimes rather open to interpretation. When taking these steps, consideration was also given to issues that may have altered the concepts and definitions, or statistical treatments recommended in the international standards, and that will be of relevance for the current updating of the IMF’s Balance of Payments Manual. Methodological concepts in some specific fields have been developed and agreed within the European System of Central Banks (ESCB), in consultation with the European Commission (Eurostat). EU Member States not initially participating in the euro area were also involved in the development of the concepts, definitions and agreed practices as described in Chapter 3.

Statistics for the euro area are not the pure sum of the statistics of its components. The ECB is a resident of the euro area, but is a non-resident of Germany where it is located. Additionally, EU institutions such as the Commission are considered as residents of the European Union, but not of the euro area. Moreover, cross-border transactions and positions that are included in national statistics have to be excluded from the statistics for the euro area as a whole when the counterparts to these transactions/positions are residents of other euro area countries.

In accordance with the division of responsibilities in the field of b.o.p./i.i.p. statistics between the European Commission (Eurostat) and the ECB (Directorate General Statistics), the B.o.p. Book focuses mainly on the concepts and definitions for the b.o.p. financial account and related income and i.i.p. statistics. Nevertheless, it also contains a number of references to items falling under the responsibility of the European Commission (i.e. goods, services, compensation of employees, the current account as a whole and the capital account), since the ECB compiles a monthly balance of payments for the euro area.

The ECB Guideline of 22 July 2004 on the statistical reporting requirements of the European Central Bank in the field of balance of payments and international investment position statistics, and the international reserves template (ECB/2004/15) states that the ECB “monitors the compilation methods used for the reporting of balance of payments and international investment position statistics, as well as the concepts and definitions applied on a regular basis by the participating Member States” and also provides for a regular update of the B.o.p. Book.

The B.o.p. Book was first published in January 1998. An update was released in August 1998 and, since November 1999, updates have been published annually. The present update of autumn 2004 provides further information on the statistical compilation systems in individual Member States and on the methodological standards agreed at the euro area/European Union level since the last update. Following the enlargement of the European Union on 1 May 2004, the country-specific details of the ten former acceding countries are now included in the B.o.p. Book and a new chapter has been added to cover the current accession countries (Bulgaria and Romania). The publication entitled “Accession countries: balance of payments/international investment position statistical methods” has therefore been discontinued.

The B.o.p. Book is released under the responsibility of the ECB’s External Statistics Division and published on the ECB’s website (www.ecb.int). It is also available in hard copy on request from the ECB’s Press and Information Division. Specific enquiries relating to individual countries may be addressed to the countries concerned, whose contributions are gratefully acknowledged. A glossary is provided in annex.
2 COMPILATION OF EURO AREA BALANCE OF PAYMENTS AND INTERNATIONAL INVESTMENT POSITION STATISTICS

2.1 THE LEGAL FRAMEWORK OF THE EURO AREA BALANCE OF PAYMENTS AND INTERNATIONAL INVESTMENT POSITION STATISTICS

The statistical requirements of the European Central Bank (ECB) with respect to the euro area national central banks (NCBs) and other competent national authorities are based on Council Regulation (EC) No 2533/98 of 23 November 1998 and the ECB Guideline of 22 July 2004 on the statistical reporting requirements of the European Central Bank in the field of balance of payments and international investment position statistics, and the international reserves template (ECB/2004/15), which replaced the former Guideline of 2 May 2003 (ECB/2003/7). This new Guideline formalises and updates the requirements specified in the “implementation package” (“Statistical requirements for Stage Three of EMU”), July 1996 – see also the updated version “Statistical information collected and compiled by the European System of Central Banks” (May 2000). It also addresses relevant needs specified in other documents formally adopted by the Governing Council of the ECB. Current international standards, such as the IMF Balance of Payments Manual (fifth edition), released in October 1993 (BPM5), the UN System of National Accounts (SNA 93) and the European System of National and Regional Accounts (ESA 95), have been used as a reference in formulating the statistical concepts and definitions.

Within the area of b.o.p. and i.i.p. statistics, responsibility at the Community level is shared between DG-S and Eurostat. With regard to the conceptual work, DG-S has prime responsibility for issues concerning the b.o.p. financial account and investment income, and the i.i.p., whereas Eurostat has prime responsibility for issues concerning all other parts of the b.o.p. current account (except investment income) and capital account. In view of the joint interest and expertise in foreign direct investment statistics, DG-S and Eurostat share responsibility and tasks in this area. DG-S alone compiles euro area b.o.p. and i.i.p. aggregates, while only Eurostat compiles EU aggregates. Annual detailed services and direct investment data for the euro area are published by Eurostat after validation by DG-S.

Additional information on the items for which the European Commission (Eurostat) is responsible is made available on its website (http://europa.eu.int/en/comm/eurostat/serven/home.htm) or on the European Commission’s “CIRCA” homepage (http://forum.europa.eu.int/Public/irc/dsis/Home/main). Eurostat’s documentation contains basic b.o.p. documentation, e.g. the Vademecum, the Compilation Guide, Technical Group reports, as well as a list of the latest publications in the field. Constantly updated BoP Working Group papers are available for both consultation and downloading.

The European Commission and the ECB cooperate closely in order to ensure that b.o.p./i.i.p. statistics are consistent and comply as far as possible with European and international statistical standards.

2.3 STATISTICAL REPORTING REQUIREMENTS FOR NATIONAL COMPILERS

2.3.1 ECB DATA REQUIREMENTS IN BALANCE OF PAYMENTS STATISTICS

Data for the b.o.p. for the euro area as a whole are required; the ECB does not use or require data on cross-border transactions within the euro area, with the important exception of the portfolio investment and portfolio investment income accounts (see Sub-section 2.5 “Methods of compiling the euro area aggregates”). B.o.p. statistics are published at monthly and quarterly frequencies. The scope and instrument and sector breakdowns of monthly and quarterly data have gradually become rather similar. In particular, this makes it possible to regularly disseminate a monthly monetary presentation of the b.o.p. However, the breakdown of the euro area b.o.p. vis-à-vis main partner countries – available from 2003 onwards – is only shown on a quarterly basis (see Sub-section 2.6).

The statistical requirements for the national b.o.p. compilers are outlined below:

2.3.1.1 MONTHLY REQUIREMENTS

The monthly b.o.p. data are required from the Member States six weeks (30 working days) after the end of the reference month. The collection of data from reporting agents is organised by the national authorities with this deadline in mind. Owing to this short period, it is permitted, to some extent, to depart from the international guidelines set out in the BPM5. Permitted are, inter alia, the recording of income on a cash basis, instead of on an accruals basis, and the provision of estimates. Furthermore, no sector breakdown is provided for financial derivatives.

The aim of the monthly b.o.p. is to provide a good picture of developments quickly enough to be of use for the analysis of flows affecting monetary conditions and exchange markets. This is notably reflected in the monetary presentation of the b.o.p. (see below and Table 7.2 in the ECB’s Monthly Bulletin).

The monthly b.o.p. data are shown on the ECB’s website from January 1997 onwards. These monthly data are revised with the publication of the next monthly up-date and with the publication or revision of the corresponding quarterly b.o.p. Data for full years are revised in the following spring and autumn, the autumn revision being made in connection with the provision of i.i.p. data.

IV. ERRORS AND OMISSIONS

Since June 2003, the ECB has published a quarterly monetary presentation of the b.o.p. This presentation intends to distinguish between those changes in the euro area resident MFIs’ external assets and liabilities that reflect the foreign transactions of the non-MFI sector and those changes that relate to the activities of the MFI sector. The following table summarises this approach.

As shown in the table below, the transactions in the net external assets of the MFI sector can be presented as the mirror image of the transactions of non-MFIs with non-euro area residents (shown in the balance of payments).

The main objective for studying the monetary presentation of the euro area b.o.p. is to be able to conduct a deeper analysis of monetary developments. In this respect, changes in the monetary aggregate M3 can be presented as the arithmetic result of changes in its counterparts, namely (i) credit to euro area residents, (ii) net external assets of euro area MFIs, (iii) longer-term financial liabilities and (iv) other counterparts. Hence, the external counterpart of M3, together with the other counterparts, can contribute to the analysis of monetary developments. Since June 2004, the monetary presentation of the euro area b.o.p. has been published on a monthly basis.

2.3.1.2 QUARTERLY REQUIREMENTS

The required breakdown of the quarterly b.o.p. statistics adheres, as far as possible, to the standards set out in the BPM5, which is consistent with the System of National Accounts 1993 (SNA 93) and with the European System of National and Regional Accounts 1995 (ESA 95). Exceptions to the application of BPM5 standards mainly relate to:

- income on direct investment, for which the ECB does not require the breakdown of income on equity into distributed and undistributed profits (i.e. dividends and reinvested earnings);
- the capital account, for which the ECB requires no breakdown;
- the other investment account, which is somewhat simplified as no maturity breakdown is required. There is also a change in the presentation of the breakdown (i.e. sectors as first priority) which is compatible with, but not identical to, the BPM5 where instruments have priority.

In line with the SNA 93, the BPM5 recommends that interest be recorded on an accruals basis. This recommendation affects the

3 As defined in the consolidated MFI balance sheet.
current account (investment income), with a complementary effect on the financial account. For the b.o.p. statistics of the euro area, accrued investment income is required only on a quarterly basis.

The ECB requires quarterly details within three months of the end of the quarter to which the data relate. The detailed quarterly breakdown has been required since June 1999 (starting with first quarter 1999 data). Annual data are not required separately, but are compiled from the quarterly data reported by the Member States for the corresponding year.

### Quarterly balance of payments for the euro area

     - Other sectors
2.3.2 ECB DATA REQUIREMENTS FOR INTERNATIONAL INVESTMENT POSITION STATISTICS

The i.i.p. reports the net external positions of direct and portfolio investment, financial derivatives, other investment and reserve assets. In this context, it complements the b.o.p. statistics, which record flows of assets and liabilities, with data on the value of stocks. In the first years of the euro area’s existence, the euro area i.i.p. was compiled by aggregating, on a net basis only, euro area countries’ year-end external positions. However, since December 2002 the euro area i.i.p. data for 1999 year-end positions onwards have enabled a differentiation between the asset and liability sides (in line with the practice applied in the reporting of the euro area b.o.p. flows since 1999) and have been compiled by summing up the positions vis-à-vis counterparts outside the euro area (i.e. on an extra-euro area basis).

The additional information on euro area assets and liabilities further enhances the link between euro area b.o.p. flows and the i.i.p., i.e. by enabling the classification of the total change between two end-of-period positions into (i) changes due to real transactions (b.o.p. flows) and (ii) other changes for each financial account item. “Other changes” include valuation changes due to price and exchange rate effects and other adjustments (for instance write-offs, reclassifications and so on). The euro area i.i.p. is valued at market prices, with the exception of direct investment stocks, for which book values are used to a large extent.

Member States are required to make their i.i.p. data available to the ECB within nine months of the year-end to which the data relate.

### Annual international investment position for the euro area

| 1. Direct investment (abroad and in the reporting economy) |
|---|---|---|---|
| Equity capital and reinvested earnings |
| MFIs (excluding central banks) |
| Other sectors |
| Other capital |
| MFIs (excluding central banks) |
| Other sectors |

| 2. Portfolio investment |
|---|---|---|---|
| Equity securities |
| Assets |
| Monetary authorities |
| General government |
| MFIs (excluding central banks) |
| Other sectors |
| Liabilities |
| MFIs (excluding central banks) |
| Other sectors |
| Debt securities (assets and liabilities) |
| Bonds and notes |
| Monetary authorities |
| General government |
| MFIs (excluding central banks) |
| Other sectors |
| Money market instruments |
| Monetary authorities |
| General government |
| MFIs (excluding central banks) |
| Other sectors |

| 3. Financial derivatives (assets, liabilities and balance) |
|---|---|---|---|
| Monetary authorities |
| General government |
| MFIs (excluding central banks) |
| Other sectors |

| 4. Other investment (assets and liabilities) |
|---|---|---|---|
| Monetary authorities |
| Loans/currency and deposits |
| Other assets/liabilities |
### General government
- Trade credits
- Loans/currency and deposits
- Loans
- Currency and deposits
- Other assets/liabilities
- MFIs (excluding central banks)
- Loans/currency and deposits
- Other assets/liabilities
- Other sectors
  - Trade credits
  - Loans/currency and deposits
  - Loans
  - Currency and deposits
- Other assets/liabilities

### V. Reserve assets (only assets)
- Monetary gold
- Special drawing rights
- Reserve position in the International Monetary Fund
- Foreign exchange
  - Currency and deposits
    - with monetary authorities
    - with MFIs (excluding central banks)
- Securities
  - Equities
  - Bonds and notes
  - Money market instruments
  - Financial derivatives
- Other claims

---

From December 2004, EU Member States will be required to provide the ECB with i.i.p. data on a quarterly basis, with the same breakdown as in the annual i.i.p. While annual data are compiled on the basis of stocks (e.g. from 2005 onwards, it will no longer be possible to derive direct investment by accumulating flows), quarterly data can be derived from flows.

### 2.3.3 ECB DATA REQUIREMENTS FOR THE EUROSYSTEM’S INTERNATIONAL RESERVES POSITION

The definition of the Eurosystem’s reserve assets, approved by the ECB Governing Council in March 1999, conforms to the BPM5 (see Section 3.11). Foreign currency-denominated claims (i.e. claims denominated in any currency other than the euro) on euro area residents held by the Eurosystem are shown as a memorandum item in the ECB Monthly Bulletin. This approach supports an analysis for monetary purposes and permits a reconciliation of the Eurosystem’s international reserves with its foreign currency liquidity position. From the April 2000 ECB Monthly Bulletin, the same breakdown has been presented for the ECB’s reserves (and related assets) pooled in accordance with Article 30 of the Statute of the ESCB. In addition to the information provided in the ECB Monthly Bulletin, the ECB publishes on its website Eurosystem and ECB data in line with the template entitled “International Reserves and Foreign Currency Liquidity”, set out in early 2000 in the IMF’s Special Data Dissemination Standard (SDDS). This information covers not only data on reserve assets, but also data on the reserve-related liabilities of the Eurosystem, and differs in some respects from the data on international reserves included in the euro area b.o.p.

### 2.4 THE ECB’S CONTRIBUTION TO THE EURO AREA AGGREGATES

The ECB’s own transactions and positions with non-euro area counterparties must also be reflected in the external statistics of the euro area. In other words, the data resulting from the compilation of the ECB’s own external statistics are added to the contributions of the euro area Member States so as to compile the total figures of the euro area aggregates (see Section 2.5 “Methods of compiling the euro area aggregates”).

---

4 The ECB does not formally subscribe to the SDDS; subscriptions are on a country-by-country basis by member countries of the IMF (see http://dsbb.imf.org).
In practice, the ECB’s “external” contributions are confined to the following items:

- **reserve assets**: reserve assets of the ECB are claims on non-residents of the euro area pooled in accordance with Article 30 of the Statute of the ESCB and thus under the direct and effective control of the ECB. As long as no further transfer of ownership takes place, in accordance with Article 30.4, external assets retained by the NCBs are under their direct and effective control and are treated as reserve assets of each individual NCB;

- **other investment**: flows between the ECB and the NCBs of Member States not participating in the euro area related to the operation of the TARGET system;

- **portfolio investment**: debt securities (mainly bonds and notes) issued in euro by non-residents of the euro area. (The ECB’s claims from debt securities in foreign currency which were issued by non-euro area residents are included under the ECB’s reserve assets). For reasons explained in Section 2.5 “Methods of compiling the euro area aggregates”, data on the ECB’s holdings of debt securities issued by other euro area residents are needed for the compilation of the total euro area aggregate figures of portfolio investment liabilities. Since the ECB has not itself issued any debt securities so far, it does not record any liabilities for portfolio investment;

- **income on portfolio investment**: income received by the ECB from the above-mentioned portfolio investment assets. As in the case of the financial account, these data are needed for the compilation of the total euro area aggregate debits of portfolio investment income (see Section 2.5 “Methods of compiling the euro area aggregates”);

- **income on other investment**: income received from the management of the ECB’s international reserves and from TARGET operations.

### 2.5 METHODS OF COMPILING THE EURO AREA AGGREGATES

Since 1997, each broad category of transaction has been broken down into credits and debits for the current and capital accounts; since 1997, into investment abroad and in the euro area for direct investment; and, since 1998, into assets and liabilities for portfolio investment and other investment. Since October 2002, the same split for direct, portfolio and other investment is applied to the euro area i.i.p. The ECB compiles the figures for the euro area by aggregating the euro area Member States’ transactions vis-à-vis non-residents of the euro area for the current and capital accounts, and transactions/holdings relating to non-residents of the euro area for the financial account and the i.i.p., excluding portfolio investment and financial derivatives.

Compilation of portfolio investment (stocks, flows and related income) and financial derivatives follows a different approach, owing to the difficulties in identifying the residency of the holders of securities issued by domestic residents. Portfolio investment flows/stocks relating to non-residents of the euro area should be allocated according to the residency of the ultimate investor (in case of liabilities of the euro area) and the non-resident debtor (in case of assets of the euro area), respectively. When euro area residents purchase securities issued by non-residents of the euro area, the related flows/stocks can be measured directly, with a sector breakdown of the euro area residents undertaking the transactions/holding the assets.

Classification of non-resident purchases/holdings of securities issued by euro area residents is difficult because these transactions/holdings are often made/held through central securities depositories or other intermediaries located in the euro area (e.g. Euroclear and Clearstream). Such purchases/holdings by non-residents of the euro area may well be
incorrectly classified because the first-known counterpart – the custodian or other intermediary – is a euro area resident.

To avoid this risk of misclassification the “liabilities” side of portfolio investment is calculated as transactions in/holdings of total securities issued by euro area residents minus the recorded acquisitions/holdings of such securities by residents of the euro area.

Euro area residents’ income on securities issued by non-residents of the euro area can be correctly identified as extra-euro area flows. However, income payments relating to securities issued by euro area residents and held by non-residents are often made through central securities depositories or other intermediaries and are therefore not identifiable for the national compiler as extra-euro area flows. Therefore, the amount of the total euro area payments to non-euro area residents is calculated as total payments made by euro area residents to recipients outside their home country minus receipts recorded by euro area residents from other euro area countries.

The net figures for euro area transactions in financial derivatives are compiled by aggregating the national net transactions of the participating Member States. A sector breakdown of this account at the euro area level has not been compiled so far for the b.o.p.; for the i.i.p. this is required for assets and liabilities separately.

As regards the Eurosystem’s international reserves position, the agreed definition of reserve assets is applied consistently both across the Eurosystem and at the national level. Hence, the reserve assets held by the Eurosystem are compiled by summing up the reserve asset holdings of the participating NCBs and of the ECB.

2.6 GEOGRAPHICAL BREAKDOWN

For the euro area quarterly b.o.p. and annual i.i.p., the ECB requires geographical details as from end-June 2004 (for flows relating to the first quarter of 2003 onwards) and as from end-September 2004 (for positions relating to end-2002 onwards), respectively.

The list of counterpart countries/regions for the euro area b.o.p./i.i.p. is closely consistent with Eurostat’s “level 1”.

The ECB’s geographical breakdowns for quarterly b.o.p. flows and annual i.i.p. data

- Denmark
- Sweden
- United Kingdom
- European Union institutions
- Other EU Member States (i.e. Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia and Slovenia)
- Switzerland
- Canada
- United States
- Japan
- Off-shore centres
- International organisations excluding the European Union institutions
- Rest of the world 1)

1) Calculated as a residual (between the total of each b.o.p./i.i.p. heading and the amounts corresponding to the counterparts listed above).
3 CONCEPTS, DEFINITIONS AND AGREED PRACTICES

The main purpose of this chapter is:
(i) to provide a comprehensive summary on the methodological standards (such as the BPM5, the SNA 93 or the ESA 95) with which all EU Member States in principle comply;

(ii) to serve as a benchmark to identify any individual country deviations, as currently described in the chapters "Country-specific details"; and

(iii) to supplement the "methodological notes" on the ECB’s website.

Most of these methodological standards have already been implemented in line with the ECB Guideline of 2 May 2003 (ECB/2003/7). Further progress is expected using available information or estimates in consultation with the ECB.

This chapter concerns primarily those methodological concepts and definitions which were developed under the responsibility of the ECB. Definitions on items under the responsibility of the European Commission (Eurostat) are limited, in this edition of the B.o.p. Book, to brief and general explanations only.

3.1 GENERAL PRINCIPLES OF BALANCE OF PAYMENTS AND INTERNATIONAL INVESTMENT POSITION STATISTICS

3.1.1 BALANCE OF PAYMENTS STATISTICS

The balance of payments (b.o.p.) is a statistical statement of the economic transactions of an economy with the rest of the world in a specific time period. A transaction is defined as an economic flow that reflects the creation, transformation, exchange, transfer, or extinction of economic value and involves changes in ownership of goods and/or financial assets or liabilities, the provision of services or the provision of labour and capital. Cross-border transactions of the euro area are transactions between residents of participating Member States, seen as one economic territory, and residents of EU Member States not participating in the euro area or residents of third countries.

Despite its name, which refers to standards applicable in the past following recommendations of the IMF Manuals up to the 4th edition, the b.o.p. is now less concerned with payments, as that term is generally understood, than with transactions. This development from a financial towards an economic approach was felt more efficient in order (i) to foster a sound economic interpretation of the figures, and (ii) to make the b.o.p. concepts compliant with the national accounts (the b.o.p. is also the “rest of the world” account). International transactions recorded in the b.o.p. may not involve the transfer of money, and some are not paid for in any sense. The inclusion of these transactions, in addition to those matched by actual payments, constitutes a principal difference between a b.o.p. statement and a record of foreign payments.

3.1.2 INTERNATIONAL INVESTMENT POSITION STATISTICS

Closely related to the flow-oriented b.o.p. framework is the stock-oriented international investment position (i.i.p.). Compiled at a specified date, the i.i.p. is a statistical statement of (i) the value and composition of the stock of an economy’s financial assets, or the economy’s claims on the rest of the world, and (ii) the value and composition of the stock of an economy’s liabilities to the rest of the world. Cross-border positions of the euro area comprise the participating Member States’ stocks of financial claims and financial liabilities vis-à-vis residents of EU Member States not participating in the euro area or residents of third countries. Also encompassed are land, other real property and other immovable assets which are:
- physically located outside the economic territory of the participating Member States
and owned by residents of participating Member States (considered as assets, from the euro area perspective); or

- physically located inside the economic territory of the participating Member States and owned by residents of non-participating Member States or residents of third countries (considered as liabilities, from the euro area perspective).

In addition, monetary gold and special drawing rights (SDRs) owned by residents of participating Member States are included.

The difference between the two sides of the balance sheet (the net position) measures that portion of the euro area’s net worth attributable to, or derived from, its relationship with the rest of the world. A change in stocks during any defined period can be attributable to transactions (i.e. b.o.p. flows), to revaluations reflecting changes in exchange rates, prices, etc. or to other adjustments (e.g. reclassifications, corrections, uncompensated seizures).

Since the i.i.p. and the financial account of the b.o.p. share many sources and methods of compilation, these two accounts are dealt with together in the following sections so as to stress their close relationship.

3.1.3 ACCOUNTING PRINCIPLES FOR TRANSACTIONS AND STOCKS

3.1.3.1 DOUBLE-ENTRY SYSTEM

The basic convention applied in constructing a euro area b.o.p. statement is that every recorded transaction is represented by two entries with equal values. One of these entries is designated a credit; the other is designated a debit. In principle, the sum of all credit entries is identical to the sum of all debit entries, and the net balance of all entries in the statement is zero. In practice, however, the accounts frequently do not balance. Data for b.o.p. estimates are often derived independently from different sources and may be incomplete. Moreover, timing and valuation effects along with a variety of other factors tend to cause imbalances in the information recorded. As a result individual b.o.p. accounts tend to aggregate to a summary net credit or net debit. A separate entry, equal to that amount with the sign reversed and labelled "net errors and omissions", is then included to balance the overall b.o.p. account.

3.1.3.2 TIME OF RECORDING THE TRANSACTIONS

In line with the BPM5, the ECB principally requires recording on a transactions basis ("accruals principle"), meaning that transactions are recorded when economic value is created, transformed, exchanged, transferred or extinguished. Claims and liabilities arise when there is a change in ownership. The change may be legal or economic. In practice, when a change in ownership is not obvious, the change may be assessed at the time that parties to a transaction record it in their books or accounts.

However, for the reporting of the monthly b.o.p., recording on a full accruals or transactions basis is not mandatory, owing to the short deadline for the provision of monthly data. In agreement with the ECB, the NCBs and other national compilers may provide data on the current and financial account in the monthly b.o.p. statistics which are based on full/partial accruals or on settlements (i.e. cash).

3.1.3.3 VALUATION OF TRANSACTIONS AND STOCKS

In principle, market prices should be used as the basis of valuation for both transactions and stocks. Thus, transactions are generally valued at the actual prices agreed upon by transactors, and stocks of assets and liabilities are valued at the market prices in effect at the time to which the balance sheet relates. Market valuation provides the most meaningful measure of the economic value of the resources available to an economy; alternatives to valuation at market price should only be used if absolutely necessary.
In practice, some deviations from the market principle may occur. *Book values* from the reporting agents’ balance sheets may, in some cases, be the only readily available source for the valuation of assets and liabilities. For instance, the own funds at book value (OFBV) of non-listed direct investment companies are used to value foreign direct investment stocks.

### 3.1.3.4 RECONCILIATION OF STOCKS AND FLOWS

The reconciliation of changes in stocks and b.o.p. flow data allows sets of data to be validated when they are collected independently and gives possible explanations for the changes in positions over a given period. These factors are:

(i) the transactions that have taken place during the period;

(ii) price changes;

(iii) exchange rate changes; and

(iv) other adjustments reflecting changes in stocks.

The greater the level of detail of the basic information on both stocks and flows, the more precise the reconciliation is. In particular, the following information is necessary:

(i) a currency breakdown to capture the *exchange rate effect*;

(ii) a breakdown of applicable market prices, especially for portfolio investment instruments, to isolate the *market value effect*;

(iii) the *timing of transactions* to select the appropriate price and exchange rate.

### 3.1.4 EURO AREA RESIDENCE

In general, the terms “resident” and “residing” mean having a centre of economic interest in the economic territory of a country, as described in Annex A of the Council Regulation (EC) No 2533/1998. In the case of the *euro area*, the economic territory comprises (i) the economic territory of the EU Member States which have adopted the euro and (ii) the ECB, which is regarded as a resident unit of the euro area.

The *rest of the world (RoW)* comprises the territories outside the euro area, i.e. EU Member States which have not adopted the euro, all third countries and non-European supranational and international organisations, including those physically located within the euro area. All EU institutions except the ECB are considered to be resident outside the euro area. Consequently, all transactions of participating Member States vis-à-vis EU institutions are recorded and classified as non-euro area transactions in the euro area b.o.p./i.i.p. statistics. A list of supranational and international institutions is given in Eurostat’s Balance of Payments Vademecum booklet.

The following are examples of borderline cases in the determination of residence:

(i) individuals from embassies and military bases are to be classified as residents of their country of origin, thereby ensuring that a distinction is made between staff employed from among host country residents and those from the country which the embassy or military base represents;

(ii) when undertaking cross-border transactions in land and/or buildings (e.g. holiday homes), the owner is treated as if he has transferred his ownership to a notional institutional unit that is actually resident in the country where the property is located. The notional unit is to be treated as being owned and controlled by the non-resident owner;

(iii) where an institutional unit operates in an offshore financial centre, it should be treated as a resident of the territory in which the centre is located.

Some territories belonging to, or countries associated with, euro area Member States might give rise to difficulties in the statistical
classification. These can be divided into the following groups:

Territories forming part of the euro area:
- Heligoland: Germany
- Canary Islands, Ceuta and Melilla: Spain;
- Monaco, French Overseas Departments (Guyana, Guadeloupe, Martinique and Réunion), Saint Pierre and Miquelon, Mayotte: France;
- Madeira, the Azores: Portugal;
- The Åland Islands: Finland.

Territories associated with euro area Member States to be included in the RoW:
- Büsingen (not Germany);
- Andorra (neither Spain nor France);
- The Netherlands Antilles and Aruba (not the Netherlands);
- French Overseas Territories (French Polynesia, New Caledonia and the Wallis and Futuna Islands) (not France);
- San Marino and the Vatican City (not Italy).

3.1.5 CLASSIFICATION PRINCIPLES FOR BALANCE OF PAYMENTS AND INTERNATIONAL INVESTMENT POSITION STATEMENTS

3.1.5.1 STANDARD COMPONENTS OF BALANCE OF PAYMENTS AND INTERNATIONAL INVESTMENT POSITION STATEMENTS

According to the BPM5, the two major classifications of transactions in the b.o.p. statement are the current account and the capital and financial accounts. In brief, the current account shows transactions in the real economy and relates to goods, services, income and current transfers; the capital and financial accounts show (broadly speaking) the transactions in the financial economy.

The major classifications within the current account are:
- goods;
- services;
- income; and
- current transfers.

The capital account records an economy’s capital transfers and its transactions in non-produced, non-financial assets (such as patents and copyrights). The financial account records an economy’s transactions in external financial assets and liabilities.

The financial account of the euro area b.o.p. and the euro area i.i.p. are structured around five accounts, differentiated by the type of financial assets/liabilities involved in the transaction:
- direct investment;
- portfolio investment;
- financial derivatives;
- other investment; and
- reserve assets.

In addition, transactions within the euro area portfolio investment, financial derivatives and other investment accounts are classified by sector, according to the institutional sector to which the euro area resident undertaking the transaction belongs (see Sub-section 3.1.6 “Sectorisation”). This sectoral analysis also applies to the corresponding stock data requested for the i.i.p.

3.1.5.2 CLASSIFICATION OF FINANCIAL FLOWS BY CREDITS/CHANGE IN ASSETS AND DEBITS/CHANGE IN LIABILITIES

Economic transactions of the euro area b.o.p. are recorded (i) as credits or debits in the case of all items of the current and capital accounts, and (ii) as changes in assets or liabilities in the case of all items of the financial account. Credits and debits are shown as gross figures, i.e. inflows from non-euro area residents will increase the amount of credits, while outflows to non-euro area residents mean an increase of debits. By contrast, changes in assets and liabilities are shown as net figures: increases (decreases) in assets indicate that a net outflow (inflow) has occurred, since the payments by euro area residents in respect of their acquisitions of assets issued by non-residents of the euro area are larger (smaller) than the receipts derived from their sale or redemption. Increases (decreases) in liabilities indicate a net inflow (outflow), since the receipts from non-
residents of the euro area in respect of their acquisitions of assets issued by euro area residents are larger (smaller) than the payments generated by their sale or redemption.

3.1.5.3 GEOGRAPHICAL ALLOCATION PRINCIPLE FOR CHANGE OF OWNERSHIP IN THE CASE OF FINANCIAL TRANSACTIONS AND POSITIONS

For financial transactions/positions, there are two possible means of classification considered to be in accord with the change-of-ownership principle, the debtor/creditor principle and the transactor principle. In order to achieve a more precise geographical allocation, the ECB requires, in principle, the application of the debtor/creditor principle, according to which transactions/positions in a country’s external liabilities are classified according to the country of the owner of the claim (the creditor) and transactions/positions in a country’s financial assets are classified according to the country that incurs the liability (the debtor). The transactor principle, on the other hand, means that transactions/positions are classified according to the country of the non-resident counterparty to the transaction. The latter principle can, in practice, be applied in two different ways, i.e. classification either by country of first-known counterpart or by country of settlement, both of which may not in all cases reflect the residence of the actual owner of the asset/liability acquired/incurred.

3.1.6 SECTORISATION

3.1.6.1 INSTITUTIONAL SECTORS

Four sectors are identified separately for euro area b.o.p./i.i.p. statistics:
(i) monetary authorities;
(ii) general government;
(iii) monetary financial institutions (MFIs);
(iv) other sectors.

Monetary authorities

The "monetary authorities” sector of the euro area b.o.p./i.i.p. and international reserve statistics consists of the Eurosystem, i.e., the ECB and the NCBs from participating Member States.

General government

The ”general government” sector is defined as in the ESA 95 (and the SNA 93) and consists of the following units:
– central government: all administrative departments, agencies, foundations, institutes and similar state bodies, the competence of which covers the entire economic territory of one country (with the exception of the administration of social security funds – see below);
– state/regional government: institutional units exercising some of the functions of government at a level below that of central government and above that of local government (with the exception of the administration of social security funds – see below);
– local government: those types of administrative departments, agencies, etc. of Member States, the competence of which covers only a restricted part of the economic territory of a country (excluding the local agencies for social security funds – see below); and
– social security funds: schemes managed by a central, state/regional or local government, the principal objective of which is to provide social benefits to the population of the country. Certain population groups are obliged to pay contributions to these schemes.

Public non-financial corporations and quasi-corporations which are market producers principally engaged in the production of goods and non-financial services should be classified as "other sectors”. This also applies to public producers involved in the aforementioned activities and recognised as independent legal entities by virtue of special legislation. Public sector credit institutions should be included in
the “MFI sector” according to both the MFI definition and the ESA 95 definition, and not under “general government”.

**MFI sector**

The “MFI sector” identified in the euro area b.o.p./i.i.p. presentation coincides with the MFI sector for money and banking statistics. Hence, it comprises (i) euro area resident credit institutions, as defined in Community law, i.e. institutions whose business is to receive deposits or other repayable funds from the public (including the proceeds arising from the sales of bank bonds to the public) and to grant credit for their own account, and (ii) all other resident financial institutions located in the euro area whose business is to receive deposits and/or close substitutes for deposits from entities other than MFIs and, for their own account (at least in economic terms), to grant credits and/or to make investments in securities. The MFI sector includes money market funds. MFIs located in EU Member States that do not participate in the euro area and banks outside the EU comprise:

(i) MFIs located in EU Member States not participating in the euro area, including those subsidiaries and branches, the parent institution of which is an MFI located in the euro area;

(ii) banks located outside the EU, including those subsidiaries and branches, the parent institution of which is an MFI located in the euro area.

Subsidiaries are separate institutional units, with independent legal status, either wholly owned or with majority ownership held by another entity (the parent institution). Branches are entities without independent legal status (they are wholly owned by the parent). However, when branches are located in another country than that in which the company controlling them is located, they are deemed to be separate institutional units.

**Other sectors**

The “other sectors” category comprises:

(a) other financial institutions not covered by the MFI definition: this sector should include the following institutions:

(i) collective investment institutions (CIIs) not considered as money market funds (MMFs) and, therefore, not classified as MFIs;

(ii) real estate investment institutions;

(iii) securities-dealer companies and agencies;

(iv) mortgage credit securitisation funds;

(v) insurance companies;

(vi) pension funds; and

(vii) financial auxiliaries;

(b) non-financial institutions:

(i) non-financial enterprises (public and private);

(ii) non-profit-making institutions serving households; and

(iii) households.

For analytical purposes and with regard to the use of the euro area i.i.p. for the compilation of other euro area statistics, such as the euro area financial accounts, information about the different sub-sectors is useful. However, in general, it is difficult for b.o.p. compilers to split “other sectors” into households, non-financial enterprises and other (non-MFI) financial institutions.

In the field of reserve assets, claims on the Bank for International Settlements (BIS) and the International Monetary Fund (IMF) are classified as claims on other monetary authorities outside the euro area.

### 3.1.6.2 Sectorisation criteria for flows and stocks

In principle, the sector attribution rules for financial flows and stocks seem to be easy to apply. Transactions and holdings in external financial assets are assigned to the institutional sector to which the resident creditor (owner of the asset) belongs. Transactions in and holdings of external financial liabilities are allocated to...
the institutional sector to which the resident issuer of the liability belongs.

Securities issued by euro area residents and owned by non-residents of the euro area are euro area liabilities; those issued by non-residents of the euro area and owned by euro area residents are euro area assets. Sectorisation should be carried out according to the above-mentioned principles.

With regard to other investment flows and stocks, it should be added that:

(i) government-guaranteed and/or bank-insured trade credits should be treated as private operations rather than as government or bank lending and should, therefore, be included under "other sectors". In these cases the debtors have incurred liabilities, but have not as yet failed to discharge them; liability for such loans would not be transferred to the government or bank that guaranteed them until the loan recipient defaulted in payment. Indeed, guarantees and financial intermediation in which the intermediary is not in fact the legal creditor or debtor should not be taken into account in statistical reporting. In addition, in some Member States it is not always clear whether these loans are insured by the government or by a public insurance company;

(ii) loans and deposits connected to repo-type agreements must be classified under the institutional sector to which the resident that extends or receives the financing belongs, regardless of the nature of the issuer of the securities acting as collateral. The residence of the borrower and lender is decisive, not the residence of the issuer of the collateral.

3.1.6.3 PRACTICAL SECTORISATION PROBLEMS

Practical problems related to sectorisation issues may arise.

Transactions between resident sectors

On the asset side – i.e. securities issued by non-residents of the euro area and acquired by euro area residents – flows are assigned to the institutional sector to which the resident subscriber or buyer of the securities belongs. As a result, the securities issued by non-residents, which are initially subscribed by credit institutions and subsequently sold to other residents, appear, in the first place, in the "MFI sector" of the b.o.p. If subsequent sales by the resident MFI sector to resident non-banks are not reflected in the b.o.p., a discrepancy between b.o.p. and i.i.p. data will arise. It may be possible to allow for such onward sales by recourse to balance sheet statistics where MFIs’ sales of foreign securities to non-MFIs may be reflected.

Assignment of an institution in a different resident sector

Institutions subject to changes in their legal status (institutional changes) or changes in the definition of the requirements to be considered for their inclusion in the different sectors (functional changes) may require special treatment in order to avoid discrepancies. The recommendation is to proceed as follows:

(i) in the flow statistics, transactions involving an institution whose sector has changed should be allocated to the appropriate new sector from the date of the change;

(ii) in the stock statistics, the reclassification of the stocks attributed to the institution in question should be made from the former sector to the new sector by means of an entry in the "other adjustments" column of the reconciliation statement.

3.2 GOODS

The goods item of the euro area b.o.p. statistics covers general merchandise, goods for processing, repairs on goods, goods procured in ports by carriers and non-monetary gold. In
accordance with general b.o.p. principles, change of ownership is the principle determining the coverage and time of recording of international transactions in goods.

Exports and imports of goods are recorded on a f.o.b./f.o.b. basis, i.e. at market value at the customs frontiers of exporting economies, including charges for insurance and transport services up to the frontier of the exporting country. The BPM5 recommends that the geographical allocation for exports should be based on the country of final destination and that of imports should be based on the country of origin.

Nevertheless, goods which are channelled through the euro area are recorded as extra-euro area transactions only by that euro area Member State in which the goods enter/leave the euro area, in order to avoid double-counting or omissions in the euro area b.o.p. statistics. The other Member State(s) involved, including that in which the goods are finally received or from which the goods were originally sent, apply the “country-of-consignment” principle, i.e. record this transaction as intra-euro area trade in goods going to or coming from another euro area Member State. (The “country-of-consignment” principle in fact applies to trade between all EU Member States).

3.3 SERVICES

The services account of the euro area b.o.p. statistics consists of the following items, which are to be recorded according to their actual delivery:

- **Transportation** covers all transportation services (sea, air, and other – including land, inland waterway, rail, space and pipeline) that are performed by euro area residents for non-residents of the euro area, or vice versa, and that involve the carriage of passengers, the movement of goods (freight), rentals (charters) of carriers with crew and related supporting and auxiliary services. Excluded are passenger services provided to non-residents in the euro area by euro area carriers within the euro area economies, or vice versa (these are included under travel).

- **Travel** includes primarily the goods and services which euro area travellers acquire from non-residents of the euro area or which euro area residents provide to travellers resident outside the euro area during visits of less than one year, net of any purchases made with money earned or provided locally. Unlike other services, travel is not a specific type of service, but an assortment of goods and services consumed by travellers. Personal transport (only international transportation) in connection with travel is not included in this item but under transportation.

- **Other services** comprise those service transactions with non-residents of the euro area which are not covered under transportation or travel, such as communication services, construction services, insurance or financial services.

3.4 INCOME

3.4.1 DEFINITION AND COVERAGE OF INCOME

Income covers two types of transactions between residents and non-residents:

(i) those involving compensation of employees, which is paid to non-resident workers or received from non-resident employers and

(ii) those involving investment income receipts and payments on external financial assets and liabilities. Income derived from the use of tangible produced assets is excluded from income and classified as appropriate under leasing or rentals, under

---

1 Tangible assets cover produced and non-produced assets. Tangible non-produced assets consist of assets that occur in nature and over which ownership may be enforced and transferred, such as land and water resources.
other business services or under transportation. Income from tangible non-produced assets is, however, classified as income under “other investment income”.

3.4.2 Definition of Compensation of Employees

Compensation of employees comprises wages, salaries, and other benefits (in cash or in kind) earned by individuals - in economies other than the euro area - for work performed for and paid for by residents of those economies. Included are the contributions paid by employers, on behalf of employees, to social security schemes or to private insurance or pension funds to secure benefits for employees.

3.4.3 Definition of Investment Income

Investment income (property income in the SNA 93 and the ESA 95) is income derived from ownership of external financial assets and payable by residents of one economy to residents of another economy. It includes interest, dividends, remittances of branch profits, and direct investors’ shares of the retained earnings of direct investment enterprises. Where separately identifiable, holding (capital) gains and losses are not classified as income on investments but as changes in the value of the investments due to market price developments. (For practical reasons, this requirement concerning holding gains and losses is often very difficult to fulfil.) Settlement flows in respect of interest rate swaps and forward rate agreements (FRAs) are not regarded as interest income, but are recorded as transactions in "financial derivatives" in the financial account.

In line with the related financial accounts, the euro area investment income account is classified by direct investment, portfolio investment and other investment components (income on reserve assets is included in other investment income). Income on direct investment and on portfolio investment is broken down further into income on equity and income on debt. In the case of portfolio investment, income on debt is subdivided into income on bonds and notes and income on money market instruments.

3.4.4 Main Types of Investment Income

The most common types of investment income are dividends in the case of equity and interest in the case of debt.

3.4.4.1 Dividends

Dividends represent income that is payable without a binding agreement between the creditor and the debtor. Dividends may be paid out of normal operating profits or out of realised or unrealised capital gains. In principle, redistributed capital gains should be classified as other capital transfers. In order to be able to estimate the share of dividends paid out of capital gains, separate information on the net operational profits and capital gains should be available. In practice, however, it appears to be very difficult to separate the dividends payable from operating profits and the dividends payable from capital gains. Therefore, wherever a compiler is unable to distinguish between the two, it is recommended for the compilation of the euro area b.o.p. that both the dividends paid out of normal operating profits and the dividends paid out of realised or unrealised capital gains are included under investment income.

Following the recommendations of the joint ECB/Eurostat Task Force on Foreign Direct Investment, reinvested earnings should also include those reinvested earnings generated by indirectly owned direct investment enterprises in proportion to the percentage of ownership.

The following borderline cases deserve attention: stock dividends, bonus shares and liquidating dividends.

Distribution of earnings in the form of stock dividends is a capitalisation of current earnings and an alternative to distributing cash dividends. Distributions of such earnings are
recorded in the euro area b.o.p. in the same manner as reinvested earnings (i.e. as investment income in the current account and as offsetting equity investments in the financial account).

General bonus shares, by contrast, represent the substitution of one type of equity (paid-up capital or capital stock) for another (reinvested earnings) and should thus not be recorded in the euro area b.o.p. Bonus shares reflect the transformation of reserves (which usually consist of accumulated, unremitted earnings) into voting power.

Liquidating dividends refer to the distribution of assets in the form of a dividend from a corporation that is going out of business. Payment of liquidating dividends may take place when a firm goes bankrupt or when a company’s assets are sold and the proceeds passed to shareholders. As liquidating dividends represent a return of capital contributions rather than a remittance of earnings, they should be recorded as withdrawals of capital in the financial account and should, consequently, be excluded from investment income.

Dividends are to be recorded on the date they become due for payment. However, when recording dividends under portfolio investment income, the euro area standards have recognised that, owing to practical difficulties, dividends should be recorded on the date they are paid rather than when they become due for payment. According to the BPM5 (paragraph 287), dividends payable to non-resident shareholders (direct investors and portfolio investors) must be recorded gross of any withholding taxes. In practice, it is often the company itself that pays the taxes to the tax authorities of the country in which it operates and, subsequently, distributes the dividends to the non-resident shareholders net of tax. In such cases, a correction should ideally be made by imputing a counter-entry (for the amount of the tax) as a current transfer (credit), so that dividends can be considered as being paid in full to the non-resident shareholders. Likewise, a correction should be made for dividends receivable.

3.4.4.2 Interest
Interest is payable in accordance with a binding agreement between the creditor and the debtor. Interest is the amount that the debtor becomes liable, under the terms of the financial instrument agreed between them, to pay to the creditor over a given period of time without reducing the amount of principal outstanding. Interest income should be recorded on an accruals basis, except for the requirements for the monthly b.o.p. (See also Sub-sections 3.4.6.1 and 3.4.6.2 on the concept of recording on an accruals basis and the compilation of accrued interest on debt securities.)

3.4.5 Specific Issues Related to Direct Investment Income

3.4.5.1 Reinvested Earnings
Reinvested earnings appear in the context of income on equity and are defined as the direct investor’s share of the total consolidated profits earned by the direct investment enterprise in the reference period covered (after allowing for tax, interest and depreciation) less dividends due for payment in the relevant period, even if these dividends relate to profits earned in earlier periods.

Reinvested earnings are to be recorded in the period in which they are earned and included in the (monthly) euro area b.o.p. statistics both (i) in the current account as imputed flows of undistributed income to the direct investor (credit) and (ii) in the financial account as additional equity capital to the direct investment enterprise (debit), the flows being equal and of opposite sign.

The calculation of reinvested earnings should be based on:

- the net operational profit which may itself be subject to various estimation methods in case of (i) delays in obtaining the definitive data or (ii) the total absence of a recording procedure to collect them;
– interpolation procedures to adjust the data to the required monthly frequency;

– the inclusion of any uncovered losses by the direct investor as negative reinvested earnings (and decrease in the claims of the affiliate for the offsetting entry in the financial account).

As to the methods of estimating the net operational profit in the event of delays occurring in obtaining the definitive data from any direct collection procedure, such as a direct investment survey or balance sheet reports, the figures related to the results of enterprises for the previous (two) year(s), adjusted by a correction factor to better reflect developments in the global economy and to capture its turning points, may be used as a proxy for the results of the current year. The correction factor should preferably refer to forecasts (i) on general developments in the results of enterprises, such as those provided by certain private associations and public institutions, or (ii) on the evolution of a variable which is representative of the global trend of the economy, such as GDP.

In the case of a total absence of a recording procedure to directly collect data on the net operational profit, estimates may be derived by applying a rate of return on the direct investment equity stock data, provided that data on the stock of direct investment equity are available. Direct investment could be considered from the same angle as securities, namely from a purely investment perspective. The estimated yield should be determined according to the direct investment enterprises’ future expected income. If other relevant information is lacking, compilers might use the current yield on long-term securities as a proxy and correct it by excluding capital gains and losses from the estimated profits so as to take account (i) of the greater risk and the lower liquidity of direct investments and (ii) of possible enterprises’ losses.

This method can also provide a geographical breakdown based on the geographical distribution of the stock of direct investment equity stemming from direct sources, such as foreign direct investment surveys, or from the accumulation of flows from an earlier benchmark level.

3.4.5.2 INCOME ON DEBT

Direct investment income on debt consists of interest payable on inter-company loans granted to or by direct investors from or to associated enterprises outside the euro area. Income on non-participating preference shares is treated as interest, rather than as dividend income, and is also recorded under the euro area direct investment income on debt account.

3.4.6 SPECIFIC ISSUES RELATED TO PORTFOLIO INVESTMENT INCOME

3.4.6.1 THE CONCEPT OF RECORDING INTEREST ON AN ACCRUALS BASIS

In line with the SNA 93 and the BPM5, interest should be recorded on an accruals basis so as to ensure that the cost of capital continually matches the provision of capital. As interest accrues, the amount of the claim must be recorded under investment income in the current account, either as a credit or as a debit, with an off-setting entry to the extent that interest is not paid – under portfolio investment, debt securities – bonds and notes or money market instruments – according to the underlying instrument, in the financial account. When the actual coupon payment occurs, this payment should not be recorded under investment income, but should instead be recorded in the financial account as a debit or credit entry, representing a reduction in liabilities/assets.

For the b.o.p. compiler, accruing interest means that interest is recorded as earned continuously from the date of purchase/acquisition of an instrument to the date of its sale or redemption.

2 For a fuller discussion of measurement issues related to portfolio investment income, see the report of the ESCB Task Force on Portfolio Investment Income 2003 (www.ecb.int/pub/).
with the appropriate amounts being attributed to each b.o.p. compilation reference period. Any estimation methods used to calculate accrued interest should be based (i) on the market value for stocks and (ii) on the prevailing interest rate in the market at the time of compiling the accrued interest ("market principle"). The prevailing interest rate at the time of issuance ("debtor principle") may be used as a pragmatic approach in the case of bonds at fixed interest rate (e.g. government bonds), if data in accordance with the market principle are difficult to obtain.

Apart from applying more global estimation methods, it is also possible to calculate accrued interest on a security-by-security basis, using information from a securities database. By way of example, this can be done by using nominal values and actual interest rates in combination with actual quotations, actual issue prices and values at maturity for each individual security.

3.4.6.2 COMPILATION OF ACCRUED INTEREST ON DEBT SECURITIES

If stocks of the outstanding amounts of domestic debt instruments held by euro area non-residents and of debt instruments issued by non-residents and held by residents are not available on a monthly basis, the monthly stocks should be built up using annual or, when available, quarterly stock data (such as those from the i.i.p.) and the monthly flows collected for b.o.p. purposes. The stock amount to be used when applying the method is the average of the stock at the beginning and that at the end of the month. To avoid the recording of capital gains/losses, the stocks should be revalued by applying the market principle to the interest rates for the period under calculation. Any difference between the stock data at the end of the period and the stock data calculated should be regarded, as mentioned previously, as valuation changes. Valuation changes can comprise exchange rate and price adjustments as well as other adjustments due to reclassifications.

Furthermore, the results of the estimates should be improved by introducing a maturity breakdown for the stocks held by non-residents, thus enabling the compiler to apply a benchmark interest rate to each maturity. If such a breakdown is not available, it could be assumed that non-residents held debt instruments in proportion to the share of each maturity in the total outstanding amount of debt instruments. This would mean applying the same maturity distribution as in the total outstanding amount of debt instruments to the holdings of these financial instruments by non-residents.

As far as foreign debt instruments held by residents are concerned, the stock data should also be broken down by the currency of denomination. Consequently, for each currency and for each maturity, the market principle should be taken as the benchmark. The calculation of the accrued income should be made in the currency in which the instrument is denominated.

Special attention will be given in the following sections to specific types of bonds, such as zero coupon bonds and other bonds with a more complicated structure, and to money market instruments.

Zero-coupon bonds

In the case of zero-coupon bonds and other deep-discounted bonds, the substantial difference between the issue price and the value at maturity is treated as interest. In order to filter out possible capital gains/losses, the calculation is done to identify the accruing interest, which is treated as a reinvestment in the parent instrument.

If zero-coupon bonds are traded in the secondary market, the transaction price may include a realised holding gain or loss, in addition to accrued interest. That additional change, i.e. due to valuation, is included in the entries into the financial account for the purchase and sale of the bond at market prices.
(the market price of these bonds includes accrued interest).

Based on the market prices, the accrued interest can be calculated separately. The discount of these bonds should be split and distributed over the compilation periods. Although the treatment of likely capital gains or losses as accrued interest could be seen as a pragmatic approach, it is recommended that account be taken of the important role of the revaluation of stocks in reconciling flows and stocks in the context of the i.i.p. and not to record the valuation changes as part of the income.

**Other bonds**

Bonds with more complicated structures are divided into four categories: index-linked bonds, junk bonds, floating-rate notes and convertible bonds. The most difficult issue here is to determine an adequate "benchmark" which could be used as the prevailing interest rate in the market to estimate the accrued interest, following a global approach. As a consequence, it may be necessary in some cases to use information on a security-by-security basis, rather than global data. Moreover, it may be rather difficult to record the investment income on these types of bonds on an accruals basis.

**Index-linked bonds**

With respect to the interest income on index-linked bonds, the accrued income derived from the indexation of the principal value cannot be measured on a cash basis. Calculations of the two parts, indexed coupon and indexation of the principal value, of the accrued income should be made by using the index to which the coupon and the principal value are linked. Due to the variety of indices, problems can appear when a global approach is followed, in particular in determining a benchmark index which is sufficiently representative; it is feasible to estimate the accrued income properly only by using information on a security-by-security basis.

As regards index-linked bonds and riskless index notes, the following requirements are set out. **Index-linked securities** are instruments with coupon and/or principal payments that are linked to commodity prices, interest rates, stock exchange or other price indices.

Interest on index-linked securities should be treated as interest income. If the value of the principal is index-linked, the issue price should be recorded as principal, and any subsequent change in value due to indexation should be treated as interest income. The change in value related to indexation should be estimated and recorded as interest income over the life of the security, and the offsetting entry should be recorded under debt securities in the portfolio investment account.³

**Riskless index notes** are debt instruments that provide a return which is linked directly to an index over a set period of time. Stock exchange indices are the most commonly used. If, for example, the index doubles over the bond’s life, the value of the investment would also double. However, if the index falls below the original level as at the time of issue, the investor is guaranteed to receive back his original stake, and this is the basis for the term "riskless". The issuer pays no coupon interest. In effect, the investor is buying what amounts to a call option on an index, with the cost of the call being the income that the investor would have had if he had invested elsewhere. The issuer receives interest free funds for the life of the bond, but bears the upside exposure risk of the index. In the light of the conceptual framework of the BPM5, the recording of income in the case of riskless index notes should not be handled like interest in the case of other index-linked securities. Arrangements relating to riskless bonds are not deemed to be indexing, because the purpose of indexing is to enhance income flows to preserve real purchasing power.

³ Eurostat has decided that, in the case of index-linked bonds, two distinct treatments should be applied, depending on whether the bond is linked to a consumer price index or to a financial asset such as foreign currency or gold. In the former case, the capital uplift due to the movement of the index is to be regarded as interest. In the latter case, the capital uplift should not be regarded as interest, but as a capital gain/loss (Eurostat news release No 24/97 of 26 March 1997).
Swapping risk exposures is not a form of indexing, but an embedded derivative. In this connection, the instrument should be valued and classified according to its primary function, such as a security, and no transactions in derivatives are to be recorded.

**Junk bonds**

As regards high-yield or junk bonds, the fact that these bonds are differentiated from other bonds solely on account of their high yield seems to make it unnecessary, in principle, to apply any special b.o.p. treatment. However, problems may arise in the following cases: first, these bonds can be traded with a significant discount on the secondary market and, second, the probability of a default is higher for junk bonds than for other bonds (defaults often take the form of arrears in interest payments). Hence, the benchmark interest rate to be used should adequately reflect the market perception of the risk of the issuer.

**Floating-rate notes**

Where standard floating-rate notes (FRNs) are concerned, there is a large variety of FRNs which incorporate a coupon calculation designed to tailor the product to match investors’ expectations and needs for income, namely so-called structured FRNs. The most important problem is to find a market interest rate benchmark which is sufficiently representative. The lack of the necessary information about the characteristics of the various FRN issues makes it difficult to find a good benchmark, unless a security-by-security approach is taken. In some cases, however, a more global approach which distinguishes between broad categories of FRNs can also produce good results. As for indexed bonds, there are derivatives embedded in the bond.

**Convertible bonds**

As the market value of a convertible bond not only reflects changes in interest rates, but also changes in the value of the embedded conversion option, a method based on the market value of the stocks and a market interest rate will not produce good results for accrued income. Calculations should be made on the basis of the nominal value of the bond and the interest rate prevailing at the time of issuance. Either an instrument-by-instrument approach or a global approach could be taken.

With regard to the benchmark, the interest rate of the convertible bond would seem to be the most relevant. However, it could also be argued that the interest rate of a comparable bond without a conversion option should be used in order to calculate the (notional) investment income and that the result of this calculation should partially be offset under the underlying financial instrument by the difference between the notional interest income and the income actually paid or received. The entry under the underlying financial instrument would then represent the implicit payment of a premium for the conversion option. In the latter case, the same interest rate could be used as benchmark as for normal bonds, whereas the first approach would require a specific benchmark for convertible bonds.

**Money market instruments**

The following method for applying the accruals principle refers to those short-term debt securities which are issued (i) at discount and (ii) with an original maturity of up to one year. As no coupon payments occur, it is necessary to introduce an estimation method for the investment income earned on money market instruments. The difference between the amount paid at the time of acquisition – either the issue or the transaction price – and the amount received when the security is redeemed or sold on the secondary market represents the income and is to be recorded in the current account (with an offsetting entry in the financial account) on an accruals basis.

### 3.4.6.3 Compilation of accrued interest with collective investment institutions

Collective investment institutions (CIIs) refer to incorporated (investment companies or investment trusts) and unincorporated undertakings (mutual funds or unit trusts) that...
collect funds from investors by issuing shares/units. The CIIs invest these funds in financial assets (mainly marketable securities and bank deposits) and in real estate. These institutions permit small investors to spread the risks of their investments through access to a wider variety of markets and financial instruments.

While the treatment of the income of the CIIs as such (asset side) is covered by the BPM5 and the recommendations about the recording of money market instruments, bonds, zero-coupon bonds and other bonds on an accruals basis, the treatment of the income of investors in the CIIs (liability side) needs some clarification due to the different distribution policies of these institutions. (Asset and liability here are viewed from the CII’s angle.)

As regards the treatment of the income of the investors in CIIs, all income accrued by a CII as a result of the investments made (on equities, debt securities, loans, deposits, etc.) is to be attributed to the holders of the shares/units over the period under review. In other words, it is the amount and the time of recording of the income on the asset side that determine the amount and the time of recording of the income on the liability side. Application of this method means that all income earned by CIIs is assigned to the investors in the CIIs, regardless of whether it is distributed or not. Dividends distributed by a CII to its shareholders must be recorded in the financial account, thus being considered as a withdrawal of capital.

Stock data can provide the necessary information concerning (i) the relevant rates of return earned by the CIIs on their assets, provided that a breakdown by instrument on the asset side is available, and (ii) the investors in resident and non-resident CIIs.

With regard to (i), b.o.p./i.i.p. compilers should make a distinction between the following broad categories of asset in order to be able to match the stocks with the relevant rates of return: bonds and notes, money market instruments and equities. The rates of return should be based on the market rates prevailing at the time of compilation (market principle) and should exclude any capital or exchange gain or loss. For debt securities, the interest rate on the benchmark that is representative for each category of instrument should be used, whereas the dividend yields of the benchmarks are to be used in the case of equity securities.

Concerning (ii), the time of the recording of the debit entries corresponding to the income to be paid to the investors in CIIs should coincide exactly with the time of the recording of the credit entries on the asset side of the CIIs. However, in practice, it is very difficult to apply such symmetrical treatment because of differences in the availability of information from resident and non-resident CIIs. Thus, to further examine this issue, a clear distinction is needed between resident CIIs (or CIIs in the reporting economy) and non-resident CIIs (or CIIs abroad).

The treatment proposed for recording the debit entries corresponding to the income paid by resident CIIs to non-resident investors is perhaps the most straightforward. Once the resident b.o.p./i.i.p. compiler has data for the stocks of assets owned by the resident CII, it can then either estimate the income earned on an accruals basis or collect this income data directly through a survey and, thereafter, allocate it directly to the non-resident investor by recording a debit entry.

The treatment by the compiler country of the resident(s) investing in non-resident CIIs should be completely symmetrical to the treatment by the compiler country of resident CIIs in which non-residents have invested. However, the compiler country of the investor may face difficulties in estimating the income from these investments owing to the possible unavailability of (i) up-to-date stock information on these assets (i.e. the value of shares/units in the non-resident CII), (ii) the aggregate asset allocation of non-resident CIIs and (iii) the country/currency distribution of these assets. For the methods used to estimate
income on CII shares, please refer to the recommendations of the ECB Task Force on Portfolio Investment Income.

Although the application of the accruals principle is required for quarterly data, this estimation method should be applied with a higher frequency, ideally on a daily basis. The use of monthly stock data and rates of return is recommended.

A clear distinction is to be made between the investment income earned by the investor and the management fee charged by the CII. The latter should already be recorded separately as a credit entry under the services account, financial services, in the first step. With regard to the estimation of this fee, an average of the percentage applicable to the shareholders’ investment can be estimated and must be applied to the estimated stocks of the period under review, in order to estimate the management fee.

3.4.7 SPECIFIC ISSUES RELATED TO OTHER INVESTMENT INCOME

3.4.7.1 COMPONENTS OF OTHER INVESTMENT INCOME

Other investment income refers to income related (i) to the “other investment” account and (ii) to “reserve assets” within the financial account. This treatment is in line with the recording of investment income as a functional category in the same manner as in the financial account of the b.o.p. and in the i.i.p. As there is no separate category for income on reserve assets, it falls under other investment income.

A breakdown by instrument should allow the estimation of accrued interest for other investment income on the basis of the stocks. However, owing to the variety of instruments underlying this income component, recording on a due-for-payment basis is accepted as a proxy for the accruals principle.

3.4.7.2 SPECIFIC ISSUES RELATED TO INCOME ON RESERVE ASSETS

Income on reserve assets, including interest income on reserve holdings of bonds and notes and money market instruments, which should be compiled on an accruals basis at least on a quarterly basis, is to be recorded indistinguishably under the “other investment” item of the investment income account.

The major practical problems regarding the compilation of income on portfolio investment within reserve assets on an accruals basis may derive from the discrepancies between the concept of income in the b.o.p./i.i.p. standards and accounting rules, since in many cases national compilers collect information on reserve assets from the accounting departments of their respective NCBs.

Within the ESCB, the accounting rules imply that accrued income, apart from the interest bought/sold and not yet paid (not recorded as income), encompasses the two following elements when NCBs buy or issue securities:

(i) accrued interest: cumulated proportion of the whole nominal value of the coupon minus interest bought/sold from the date of the purchase/issuance of the security to date;

(ii) amortisation of premium or discount: when securities are bought (asset side of the balance sheet) or issued and sold (liability side) above or below par value (without taking into account interest sold or bought), the difference between the price of the deal and the nominal value of securities should be amortised until redemption, and is thus considered as income. This premium/discount is updated quarterly according to the market price of securities. At end–year, the book value of securities is adjusted to reflect the market value if the market value is less than the book value; the unrealised loss is then reflected in the profit and loss account.
The combination of these two elements, especially as far as the recognition of unrealised losses is concerned, determines that unrealised losses would be recognised in the profit and loss account only if the market price of a security had moved down at the end of the year. Thus, this accounting practice diverges from the “market principle” (see Sub-section 3.4.6.1 “The concept of recording interest on an accruals basis”) in view of the fact that it entails an asymmetric treatment: only unrealised losses are incorporated into the price of the instrument and are thus taken into account in the calculation of the accrued interest for subsequent periods. Unrealised profits, however, are not considered until the moment they are realised (either at maturity or when securities in the portfolio of an NCB are sold). As a consequence of obtaining information on accrued interest following accounting rules, the overall amount of income on reserve assets could be systematically underestimated. It is therefore recommended also to use information from other available sources (i.e. the operations departments) in order to come closer to a valuation of the underlying financial instruments on a marked-to-market basis.

### 3.5 CURRENT TRANSFERS

Transfers are offsetting items required to balance unilateral transactions in which one economic entity provides a real resource, such as goods or services, or a financial item, to another entity without receiving any real resource or financial item in exchange.

Current transfers of the euro area consist of all transfers that are not transfers of capital. Current transfers directly affect the level of disposable income of the euro area donor or recipient. They include those of general government, e.g. transfers relating to current international cooperation between different governments, payment of current taxes on income and wealth, etc., and other transfers, e.g. workers’ remittances, insurance premiums – less service charges – and claims on non-life insurance.

### 3.6 CAPITAL ACCOUNT

The capital account covers (i) capital transfers and (ii) the acquisition/disposal of non-produced, non-financial assets.

#### 3.6.1 CAPITAL TRANSFERS AND SUB-COMPONENTS

**3.6.1.1 DISTINCTION OF CAPITAL TRANSFERS FROM CURRENT TRANSFERS**

The separation of capital and current transfers within the b.o.p. has been introduced for the purpose of achieving compatibility with National Accounts statistics. For b.o.p. statistics, the sum of the current account balance and the balance on capital account corresponds to the net lending/net borrowing of the total economy. However, the current account balance as such is viewed as an important economic indicator and the classification of transfers as current or capital has an impact on the resulting surplus or deficit on the current account. It is, therefore, vital that transfers are recorded appropriately in the b.o.p. current or capital account.

For the definition of transfers and current transfers see Section 3.5.

**Capital transfers consist of:**

(i) transfers of ownership of fixed assets;

(ii) transfers of funds linked to, or conditional upon, the acquisition or disposal of fixed assets; or

(iii) the cancellation, without any counterpart being received in return, of liabilities by creditors.

Capital transfers may be in cash or in kind.

Capital transfers in cash are linked to, or conditional upon, the acquisition or disposal of a fixed asset by one or both parties to the...
transaction and should be recorded when the payment is due to be made.

Capital transfers in kind are (i) transfers of ownership of a fixed asset or (ii) the forgiveness, by mutual agreement between creditor and debtor, of the debtor’s financial liability when no counterpart is received in return by the creditor.

Capital transfers involve the disposal/acquisition of assets resulting in a change in the stocks of assets of one or both parties to the transaction. They are usually large and occur infrequently, though there are exceptions, as in the case of some public development aid transactions, for instance.

In practice, the distinction between current and capital transfers is to be found in the use of the transfer by the recipient. B.o.p. compilers often encounter classification problems in the case of debits (the recipient is a non-resident) when the use of the transfer is difficult to identify. Some examples are listed below:

(i) public development aid/government aid to developing countries often takes the form of global funding for a public budget without any separation according to the use of the funds as operating expenditure or investment (public equipment or subsidiaries of private firms);

(ii) inheritance tax may be regarded in two different ways: as a transfer of capital by the taxpayer or as a current receipt by the government;

(iii) small instalments;

(iv) the treatment of set-aside payments/subsidies in agriculture for mandatory production cut-backs.

Each case must be considered carefully by b.o.p. compilers. In case of remaining doubt a cash transfer should be classified as a current transfer and should hence appear in the current account.

There is a special difficulty relating to transfers between EU institutions and Member States, which can involve large amounts. Since the use of funds received through transfers of EU institutions (grants, subsidies, etc.) is sometimes difficult to determine, inconsistent recording may occur e.g. the EU institutions making the payment treat the transactions as current transfers and the recipients record them as capital transfers. To help consistency, the European Commission (Eurostat) provides the Member States with a tentative split of each EU fund into current and capital transfers.

3.6.1.2 THE SUB-COMPONENT OF DEBT FORGIVENESS

When a creditor in a euro area Member State formally agrees – via a contractual arrangement – with a debtor country outside the euro area to forgive (extinguish) all, or part, of the debtor’s obligations, the amount forgiven is treated as a capital transfer from the creditor to the debtor. In effect, the b.o.p. statistics reflect a reduction of the liability offset by the transfer. Only cancellations based on mutual agreements representing capital transfers should be recorded in the euro area b.o.p. The writing-off of debts reflects a capital loss which should not be recorded as a transfer.

Data on general government debt forgiveness should be available from official sources or might be made available to the central bank directly by the general government/Treasury. Data on debt forgiveness by banks are sometimes more difficult to capture, although in some Member States they are available directly from the MFIs.

3.6.1.3 THE SUB-COMPONENT OF INVESTMENT GRANTS

Investment grants consist of capital transfers, in cash or in kind, made by governments to units which are not residents of the euro area, or vice versa, to finance all or part of the costs of
acquiring fixed assets. The recipients are obliged to use investment grants received in cash for purposes of gross fixed capital formation, and the grants are often tied to specific investment projects, such as large construction projects. If these projects continue over a long period of time, investment grants (in cash) may be paid in instalments. Payments in instalments are classified as capital transfers, even in cases where they are recorded successively in different accounting periods.

In principle, official records should provide data on investment grants. However, these records are often held by different official bodies and are, in some cases, not easy to translate into b.o.p. items.

3.6.1.4 THE SUB-COMPONENT OF MIGRANTS’ TRANSFERS

Migrants are individuals other than students, medical patients and diplomatic, military and similar personnel who move their home from one country to another and who stay in the new country for at least one year. Migrants’ transfers refer to the household and personal effects, together with the financial claims and liabilities that migrants transfer at the time they move from one country to another.

The value of the household and personal effects of migrants, together with the movable capital goods that they actually transfer, should be recorded as transactions in goods, with offsetting entries under migrants’ transfers in the capital account. The distinction between migrants’ transfers and workers’ remittances may be difficult to make when transfers are made in cash.

Migrants’ transfers are often difficult to capture statistically. B.o.p. compilers use various data sources to obtain the data or rely on surveys.

3.6.2 ACQUISITION/DISPOSAL OF NON-PRODUCED NON-FINANCIAL ASSETS

Acquisitions/disposals of non-produced, non-financial assets cover the acquisition/disposal of non-produced tangible assets (land and subsoil assets) and the acquisition/disposal of non-produced intangible assets, such as patents, copyrights, trademarks, franchises, etc., and leases or other transferable contracts. Only the purchase/sale, but not the use of such assets, is to be recorded in this category of the euro area capital account. Concerning transactions in land, an acquisition/disposal is deemed to occur between resident units, and the non-resident acquires a financial claim on a notional resident unit. Therefore, changes of ownership in land (i.e. real estate) usually are classified as financial transactions under direct investment (see also Sub-section 3.7.1 “Direct investment/definition and coverage”).

3.7 DIRECT INVESTMENT

3.7.1 DEFINITION AND COVERAGE

Direct investment reflects the objective of a resident entity in one economy to obtain a lasting interest in an enterprise resident in another economy. In line with international standards (IMF/OECD), a “10% ownership criterion” is applied in order to infer a direct investment relationship, i.e. the existence of such a lasting interest, in the case of the euro area b.o.p and i.i.p. Based on this criterion, a direct investment relationship can exist between related enterprises, regardless of whether the linkage involves a single chain or a number of chains. It can extend to a direct investment enterprise’s subsidiaries, sub-subsidiaries and associates. Once the direct investment has been established, all subsequent financial flows between the related entities are recorded as direct investment transactions, regardless of the financial instrument used, except in the case of transactions between affiliated banks (MFIs) and other financial intermediaries where direct

---

4 Except from those related to financial derivatives between affiliates for which the Working Group on Balance of Payments and External Reserves Statistics (WGBP&ER), in line with an IMF proposal, agreed – for practical reasons – on reporting under the functional category of financial derivatives, rather than under FDI/other capital.
investment transactions are confined to those of a permanent capital nature.

Special-purpose entities (SPEs) are enterprises in the form of holding companies, base companies, regional headquarters or other types of subsidiaries, which are established for the purpose of managing foreign exchange risks, facilitating the financing of investments or otherwise engaging in financial transactions. They are considered to be direct investors and/or direct investment enterprises. However, where SPEs have the sole purpose of acting as a financial intermediary (as is the case for banks and other financial intermediaries, such as brokers), transactions with the parent companies or with direct investment companies that are also financial intermediaries recorded under direct investment are limited to those associated with permanent debt and equity (see above).

The components of direct investment transactions are equity capital, reinvested earnings and other capital associated with various inter-company debt transactions. Real estate investment including private, non-business real estate investment should be recorded as well. Private non-business real estate investment relates, in particular, to holiday and other residences owned by non-residents, whether for personal use or leased to others.

Equity capital comprises equity in branches, all shares in subsidiaries and associates (with the exception of non-participating preference shares that are treated as debt securities) and other capital contributions.

Reinvested earnings consist of the offsetting entry to the direct investor’s share of earnings not distributed as dividends by subsidiaries or associates and earnings of branches not remitted to the direct investor; a corresponding amount should be recorded under investment income. (See Sub-section 3.4.5.1 “Reinvested earnings”).

Other capital covers all inter-company financial transactions (borrowing and lending of funds) – including debt securities and suppliers’ credits (i.e. trade credits) – between direct investors and subsidiaries, branches and associates.

3.7.2 RECORDING DIRECT INVESTMENT ON A DIRECTIONAL BASIS

Following the recommendations of the IMF and OECD guidelines, direct investment relationships are recorded in euro area statistics using the directional principle, implying that financial transactions between the euro area resident direct investors and the non-euro area direct investment enterprises are classified as direct investment abroad in the euro area b.o.p./i.i.p. (negative or positive, depending on the direction of the flow). Symmetrically, the financial transactions between resident direct investment enterprises and non-euro area direct investors are classified as direct investment in the reporting economy in the euro area.

An exception relates to direct investment flows/positions between companies of the same group which do not however have any direct ownership link to each other (the so-called “fellow” or “sister” companies). In this case, it is recommended that the “asset/liability principle” be applied, i.e. that all assets are recorded as direct investment abroad and all liabilities as direct investment in the reporting economy, in line with recommendations by the OECD and the IMF.

In order to apply the directional principle correctly, it is essential to determine the status of the euro area resident enterprise (i.e. either as a direct investor or as a direct investment enterprise) in relation to its counterparty in each case (likewise for holdings). However, the identities of the parties involved and their positions relative to a group hierarchy, which may change over time, are not always directly available from some collection systems; thus, compliance with the definition may cause problems in practice. The application of the directional principle may be particularly
difficult in the case of companies without direct links of ownership, i.e. the so-called "grandmother"/"granddaughter" companies.

Comprehensive registers to determine the relationship of the euro area resident company vis-à-vis each direct investment-related non-euro area resident enterprise are useful. However, since creating and maintaining such comprehensive registers so as to work in a fully automated way is costly, most compilers identify the status of companies by using a combination of:

(i) an individual selection procedure, which consists in requesting additional information on the status of the resident company vis-à-vis the non-resident counterparty from the reporting agents for all cross-border flows (and similarly for stocks) above a certain threshold; and

(ii) information from registers, by carrying out cross-checks as far as possible.

The threshold aims to ensure that the selection of enterprises is representative. In principle, this threshold is applied to holdings and transactions according to two main selection criteria:

(i) the importance of the reporting company: the identity of the non-resident counterparty must be provided for all reported cross-border flows/holdings of the most significant resident direct investors/direct investment enterprises;

(ii) the amount of transactions/holdings: in this case, the obligation to identify the non-resident counterparty is restricted to all cross-border flows exceeding the amount of the threshold.

This combined approach, using registers and individual information from reporting agents, allows a correct classification of flows (and stocks) exceeding the threshold according to the directional principle and can be applied by most euro area countries. It produces reliable results in accordance with the approved methodology, thereby increasing the coherence and compatibility of the euro area b.o.p./i.i.p. statistics.

However, asymmetries at the euro area level can still appear owing to the impossibility of defining a common threshold in terms of an absolute value. In this respect, information on direct investment relationships obtained via the method described above may be used to develop less costly comprehensive registers, which could progressively be used to improve classification.

3.7.3 SPECIAL ISSUES RELATED TO STOCKS

3.7.3.1 VALUATION CRITERIA

With regard to the valuation of direct investment stocks, the internationally recommended approach is to use market prices. Due to the absence of market prices, as an approximation direct investment in non-listed companies is valued on the basis of the volume of own funds of the direct investment companies involved.

The criteria for the valuation of direct investment stocks in the contribution to the euro area i.i.p. are (a) the stock exchange price for listed companies, (b) for non-listed companies a valuation based on their own funds at book value, using a common definition comprising the following accounting items: (i) paid-up capital (excluding own shares and including share premium accounts); (ii) all types of reserves (including investment grants when accounting guidelines consider them company reserves); and (iii) non-distributed profits net of losses (including results for the current year).

The possibility of publishing in parallel direct investment stocks for the euro area as memorandum items on the basis of other criteria (i.e. marked-to-market or based entirely on own funds at book value) is under consideration.
3.7.3.2 ISSUES RELATED TO THE ACCUMULATION OF FLOWS

In cases, in particular, where the real stocks resulting from surveys are not available within a reasonable time horizon, compilers could consider the use of accumulated flows to supplement the outcome of the latest available surveys. However, the use of accumulated flows for the estimation of direct investment stocks poses several problems. Even if reinvested earnings are captured in transactions and the directional principle is applied to the direct investment flows, significant discrepancies can arise between real stock data and the estimates obtained by means of the accumulation of flows, owing to different valuation schemes. Therefore, the accumulation of flows is not regarded as an acceptable method over the long term for the estimation of direct investment stocks within the euro area. Only in cases where: (i) the basic benchmark stocks are available; (ii) occasional surveys are developed; and (iii) a reconciliation exercise between stocks and flows is carried out, could accumulated flows be used to obtain more frequent and/or initial estimates of the data.

3.8 PORTFOLIO INVESTMENT

3.8.1 DEFINITION AND COVERAGE

The euro area portfolio investment account includes (i) equity securities and (ii) debt securities in the form of bonds and notes and money market instruments, except for those falling into the category of either direct investment or reserve assets. Financial derivatives are excluded from portfolio investment and shown in a separate category of the financial account and the i.i.p. (see Section 3.9 “Financial derivatives”), in line with recent IMF recommendations.

The equity securities item covers all instruments representing claims on the residual value of incorporated enterprises after the claims of all creditors have been met. Shares, stocks, preferred stock or shares, participation, or similar documents usually denote ownership of equity. Transactions/holdings of shares of collective investment institutions, e.g. investment funds, are also included.

Bonds and notes are securities issued with an initial maturity of more than one year which usually give the holder (i) the unconditional right to a fixed monetary income or contractually determined variable monetary income (payment of interest being independent of the earnings of the debtor) and (ii) the unconditional right to a fixed sum in repayment of principal on a specified date or dates. Transactions and holdings in securities issued with a maturity of more than one year are always classified as bonds and notes in the euro area b.o.p./i.i.p., even though their residual maturity at the time of the investment may be one year or less.

Unlike bonds and notes, money market instruments are securities issued with an initial maturity of one year or less. They generally give the holder the unconditional right to receive a stated, fixed sum of money on a specified date. These instruments are usually traded, at a discount, in organised markets; the discount is dependent upon the interest rate of the instrument relative to the market interest rate and the time remaining to maturity. Examples of such instruments are Treasury bills, commercial and financial paper and bankers’ acceptances.

Collateralised loans and other relevant transactions/holdings related to repurchase agreements involving debt securities are recorded in the euro area other investment account.

The recording of portfolio investment transactions in the euro area b.o.p. takes place when the euro area creditors or debtors enter the claim or liability in their books. Transactions should be recorded, in principle, at the effective...
price paid or received, less commissions and expenses. Thus, in the case of securities with coupon interest, the interest accrued from the last payment of interest is included and, for securities issued at a discount, the interest accumulated since issue is included. Offsetting entries for interest accrued are required in the quarterly b.o.p. financial account and in the i.i.p. (see Sub-section 3.4.6 “Specific issues related to portfolio investment income”); in the monthly b.o.p. items the same treatment is recommended (but not required), in line with the income account.

3.8.2 GEOGRAPHICAL ALLOCATION PRINCIPLE FOR CHANGE OF OWNERSHIP

With regard to portfolio investment instruments, whether these are considered to be external depends only on the residence of the issuer in the case of assets and on that of the beneficiary/holder of the securities in the case of liabilities, regardless of the type of instrument, the currency of denomination or the location of the market on which the securities are issued.

Different institutional features of the financial markets impinge on the ability of the compiler to allocate the flows/stocks in euro area liabilities (and in debits to the related income account) solely according to the creditor principle. Given the participation of various financial intermediaries in international transactions and the presence of an active secondary market for many existing liabilities, the euro area resident issuer (and the b.o.p. compiler) may not be aware of the final destination of the outward income flow or of the residency of the ultimate beneficiaries/holders of securities issued by euro area residents. This is particularly likely when flows occur through international financial centres or clearing houses. Therefore, for portfolio investment, the recording of liabilities (and the related income debits) in many cases in practice follows one variation of the transactor principle, i.e. the first known counterparty. It may be possible, periodically, to reassess the disposition of the euro area’s portfolio liabilities by using counterparty data from creditor countries. The IMF’s Co-ordinated Portfolio Investment Survey could play a valuable role in this respect.

On the asset side (and for related income credits), the application of the debtor principle should prove more straightforward, as the resident holder should know the identity and country of residence of the debtor (issuer).

3.8.3 SECTORAL BREAKDOWN OF PORTFOLIO INVESTMENT LIABILITIES

From June 2006, euro area countries will provide flows and stocks of portfolio investment assets in the form of euro area securities, broken down by issuer sector. In combination with national portfolio investment liabilities, this will permit the compilation of euro area portfolio investment liabilities broken down by the sector of the euro area resident issuer.

3.8.4 SPECIFIC TYPES OF DEBT SECURITIES

The following debt instruments have certain specific characteristics which have a bearing on how they are recorded.

Note issuance facilities
A note issued under a note issuance facility (NIF; usually a medium-term arrangement of five to seven years) is a short-term instrument (e.g. three to six months) issued by a borrower in his own name under a contractual commitment with a bank or group of banks either to underwrite the notes and purchase any unsold notes at particular borrowing or rollover dates or to provide stand-by credits. The facility is a form of revolving credit, and the paper issued is often referred to as a Euronote or a promissory note. If the borrower is a bank, the paper is, in effect, a certificate of deposit. (At times, a facility is arranged to issue short-term notes without an underwriting commitment, but usually there is a separate stand-by credit commitment. Notes issued without an
underwriting commitment are referred to as Euro commercial paper.)

For the purpose of b.o.p. recording, the creation of NIFs does not require entries in the financial account because the NIFs are contingent. When notes are issued and sold under an NIF, the transaction is recorded in such a way that the sale is entered as a liability for the borrower and as an asset for the buyer (the bank or other investor). Repayments are entered accordingly. Any fees associated with the creation and operation of NIFs or bank placements of notes with other investors are entered as financial services in the current account. As recommended for other debt securities, discounts or premiums on the notes purchased by banks or other investors (apart from the fees paid by the latter to banks) are treated as interest income or negative interest income, respectively, at the time of purchase.

**Perpetual bonds**

Perpetual bonds are bonds that never mature. This means that such a bond theoretically provides the holder with an infinite stream of income payments. In a number of countries, perpetual bonds are classified as second-tier equity in the balance sheets of the issuing enterprises. Nevertheless, as the income payable on these bonds is normally independent of the earnings of the issuing enterprise, perpetual bonds are classified as bonds and notes, rather than as equity, in the b.o.p. and i.i.p.

**Collateralised mortgage obligations/asset-backed securities**

Collateralised mortgage obligations and other asset-backed securities are instruments that relate specifically to an asset or a group of assets held by the issuing enterprise. Banks may issue securities based on mortgage loans they grant to households. The income that banks earn from lending activities is used to pay interest on the securities and the mortgages are used as collateral for the securities. The holder of the asset-backed security does not own the asset backing the security; the collateral provided with the security is contingent. Securities based on mortgage obligations are favoured by lending institutions, as it is possible with such securities to match the maturity of an enterprise’s assets (its mortgages) with the maturity of its liabilities (the securities). There are other types of asset-backed securities that enable the issuing enterprise to have access to cash before the related assets mature.

### 3.8.5 Borderline Cases

It is not always easy to distinguish portfolio investment from the other categories of the financial account and the i.i.p. In particular, the distinction between portfolio investment and other investment is less clear-cut than in the case of direct investment, financial derivatives and reserve assets. According to the BPM5, the classification of portfolio investment should be based on the criterion of tradability, i.e. all instruments which are traded or tradable in organised and other financial markets are, in principle, considered as portfolio investment, unless they are recorded as direct investment (see Sub-section 3.7.1), financial derivatives (see Sub-section 3.9.1) or reserve assets (see Sub-section 3.11.1). This definition includes those instruments structured in a form identical to instruments of a negotiable nature, even though they may not actually be traded in organised (secondary) markets and may be placed directly with investors through – publicly announced – private offerings and held to maturity.

As stated above, there are borderline cases between portfolio and other investment. The agreed treatment of these borderline cases within euro area b.o.p./i.i.p. statistics is presented below:

*Depository receipts* should be recorded according to the underlying instrument. In addition, they should be classified as domestic or foreign securities according to the country of residence of the issuer of the underlying security, and not that of the financial institution.
which merely acts as an intermediary and does not carry the underlying security on its balance sheet.

*Investments in mutual funds and investment trusts* should be recorded as equity under portfolio investment.

*Negotiable certificates of deposit* Negotiable certificates of deposit are in principle classified as portfolio investment/debt securities – according to their original maturity, they are classified either as bonds and notes (maturity in excess of one year) or as money market instruments (maturity of one year or less). A small minority of certificates of deposit are known to be non-negotiable and, where identified, should be classified as other investment/currency and deposits rather than as money market instruments.

*Participating shares* Participating shares are regarded as normal equity and recorded under portfolio investment if they account for less than 10% of the shares of an enterprise and are, therefore, not to be classified as direct investment.

*Preference shares* Preference shares are classified under portfolio investment, as equity securities if the shares are participating and as debt securities if the shares are non-participating. If it is not possible to distinguish between types of preference share (i.e. participating or non-participating), all shares should be recorded as equity securities.

*Private placements* Two types of private placements can be distinguished. Publicly announced private placements are tradable as from the time of issue and should, therefore, be recorded in portfolio investment. Privately arranged private placements are placements of securities which are not publicly announced at the time of issue and should be recorded under other investment unless or until they become tradable. Tradable loans (i.e. “Schuldscheine”) “Schuldscheine” are classified as debt instruments as they are negotiable and a type of promissory note. Although the instrument demonstrates the characteristics of both a loan and a security, the BPM5 (paragraph 415) clearly states in its definition of “loans” that the document or instrument which evidences a loan should be non-negotiable. Owing to their tradable nature, “Schuldscheine” are therefore precluded from classification as loans under other investment, and should be classified as debt securities under portfolio investment.

3.8.6 SPECIAL ISSUES RELATED TO STOCKS

3.8.6.1 VALUATION PROPOSALS

*Market values* should be applied in the case of equity and debt securities, on both the asset and the liability sides, since the i.i.p. must show the economic value of the securities and not the value of redemption. The relevant prices are those prevailing at the end of the reference period to which the reporting relates.

The market prices of both *equity and debt securities listed in organised markets or readily tradable* are easy to identify as they are the quotation prices. The *equity of enterprises listed on a stock exchange* should be valued using the price prevailing on the main stock exchange concerned at the close of business on the last day of the period. *Equities not quoted on stock exchanges* or not regularly traded should be estimated by using either prices of comparable quoted shares or theoretical prices derived from the enterprises’ net asset values. A quoted traded market price, again at the close of business on the last day of the period, should be used for the market value of *listed debt securities*. For *debt securities that are not readily tradable*, the net present value of the expected stream of future payments/receipts could be a good proxy. Otherwise, the market price of a security that closely approximates the

6 In practice, the distinction between public and private private placements may be difficult to make without a security-by-security system.
tenor, risk and payment characteristics of the unpriced security could be an alternative. Finally, a price index based on similar maturities in the same currency could also be used to approach the market value of these types of securities. In all cases, closing mid-market exchange rates prevailing at the end of the period should be applied to the instruments denominated in foreign currency in order to convert them into euro.

3.8.6.2 ISSUES RELATED TO THE ACCUMULATION OF FLOWS

Both price and exchange rate adjustments are necessary for the accumulation of portfolio investment flows to be a good proxy for marked-to-market stocks and, therefore, to be compatible with direct recorded portfolio stock data.

The perpetual inventory model is the most common method used to derive price adjustments. This model requires a benchmark estimate of the stock data. Such an estimate can be obtained from an occasional collection of stock data. Alternatively a point in time when the stock position of the instrument is known or assumed to be nil can also be used as the base. The model calculates the value of a stock at the end of a period as the value of the stock at the beginning of the period, plus the impact of transaction and non-transaction-related changes in the value of the stock during the period. Calculations should initially be made in the currencies in which the instruments are denominated and converted, by using prevailing exchange rates, to the base currency.

More precise estimates could be obtained by making the required adjustments on a security-by-security basis, although much more detailed information would be necessary in order to take factors such as bonus issues or write-offs into account. Adjustments should also be carried out whenever an issue matures, if detailed information is available. The availability of ISIN codes for all securities would be very helpful for this approach. Otherwise, market prices and/or indices could be used to estimate the broad effect that these changes in volume may have on the stock outstanding.

Special care is needed in cumulating transactions when exchange rates vary during the period. Exchange rate adjustments should be applied for securities data analysed by currency. The actual exchange rates of the transaction and the closing mid-market exchange rates at the end of the period should provide the valid reference necessary to derive exchange rate adjustments. The average exchange rate for the reference period could be used as a proxy for the actual exchange rate at which the transaction was executed, where this is not available or where data are reported in aggregate.

3.9 FINANCIAL DERIVATIVES

3.9.1 DEFINITION AND COVERAGE

Financial derivatives are financial instruments that are linked to a specific financial instrument, indicator or commodity, and through which specific financial risks can be traded in financial markets in their own right. Transactions in financial derivatives are treated as separate transactions, rather than as integral parts of the value of underlying transactions to which they may be linked. The transactions and positions recorded under the item "financial derivatives" in the euro area b.o.p. and i.i.p. are those in options, futures, swaps, forward foreign exchange contracts and credit derivatives. For practical reasons relating to measurement, embedded derivatives are not separately distinguished from the underlying instruments to which they are linked.

Owing to practical problems involved in separating the asset and liability flows in a meaningful way for some derivative instruments, all financial derivatives transactions in the euro area b.o.p. financial account are recorded on a net basis. By contrast, financial derivative asset and liability positions in the i.i.p. should be recorded on a gross basis.
The recording of transactions in financial derivatives takes place when both creditor and debtor enter the claim and liability, respectively, in their books.

A further important point is to distinguish which flows/stocks associated with financial derivatives are properly recorded in the financial derivatives account in the b.o.p./i.i.p. and which should be recorded elsewhere (e.g. under other investment).7

The following sections will introduce the main types of financial derivatives and present practical issues related to their recording in the b.o.p. and i.i.p.

3.9.2 FUTURES

3.9.2.1 GENERAL CHARACTERISTICS OF FUTURES

A futures contract is a form of forward contract in that it conveys the obligation to purchase or sell a specified quantity of an asset at a set price on a fixed future date. The most important characteristics of a futures contract are that the terms of the contract are standardised, that trading must be conducted upon, and regulated by, a centralised exchange, and that futures are subject to regular margining. The contracts usually state the quantity to be delivered, and they are normally traded in a cycle of predetermined delivery dates (e.g. March, June, September and December). The trading of futures contracts takes the form of “open outcry” in trading pits or via automated trading systems, with price movements being expressed in “ticks”; one tick represents 0.01% of the nominal value of the trading unit (e.g. 0.01% of a US cent, or 0.0001% of a US dollar).

Exchanges use the services of a clearing house to match and settle all transactions between members. Futures contracts are marked-to-market daily, which involves the buyer/seller paying/receiving the difference between the rate at the close of business of the day and the rate on the previous day. In order to operate on an exchange, a trader must have a margin account, into which the trader must pay initial margins (repayable) and variation margins (non-repayable) when they are required.

The initial margin requires each party to a contract to deposit a fixed sum with the clearing house as soon as the contract is executed. This amount is set at a level which the exchange considers sufficient to cover the anticipated scale of daily price movements and is used to ensure that each counterparty can meet its potential obligations in the event of losses. While the initial margin can be a cash payment, it is often met by posting collateral. The initial margin is returned to the depositors once the contract is closed out.

The variation margin reflects the actual profit or loss realised on the contract from a daily marked-to-market valuation and is used, over the life of the contract, to fund the effective transfer of the asset from one counterparty to the other. Owing to the fact that the transfers to and from both counterparties’ accounts take place daily, the contract starts at a risk neutral position each day. Some exchanges, however, choose to retain this daily variation margin until the end of the contract, rather than passing it on each day. In many cases the margining position of each counterparty is calculated on a net basis (netting purchased and sold contracts) by the clearing house. In practice, there might be only one margining account, which makes it more difficult to separate initial margin and variation margin payments.

In all futures deals, the clearing house itself becomes a legal counterparty to the contract. Hence, the creditworthiness of any counterparty is not a factor in exchange-traded contracts, as the clearing house will settle all accounts should one counterparty default. When establishing a futures contract, a counterparty will have to pay commission to a broker for carrying out a transaction, as well as to the clearing house itself.

7 In this context, it is worth noting that in money and banking statistics repayable margin payments are considered to be deposits only where they are paid to or received by an MFI.
There are two main ways of liquidating a futures contract. One is to take up an offsetting futures position prior to the value date in order to net off the existing obligation on the clearing house’s books. The other is to allow the contract to expire, at which time the buyer can sometimes take physical delivery of the commodity or instrument (where such exist) or choose to accept the cash equivalent. In the most active and developed markets, such as short-term interest rate futures markets, usually only cash settlement is authorised (e.g. three-month contracts on the LIFFE, MATIF, or DTB exchanges). However, long-term contracts (e.g. ten-year contracts) may involve delivery of the securities.

3.9.2.2 PRACTICAL TREATMENT OF FUTURES IN THE B.O.P./I.I.P.

At the start of a futures contract, no transaction is recorded under financial derivatives in the b.o.p. The futures-style variation margin payments that are made during the life of a contract with a non-resident counterparty are non-repayable in nature and should be recorded as transactions in financial derivatives. As it is the case for exchange-traded options with futures-style margining (see Sub-section 3.9.3.1 below), the initial margin payments, which are repayable, should be recorded as transactions in the other investment account.

In principle, the market values of futures contracts should be recorded as financial derivative assets and liabilities in the i.i.p. In practice, however, the market values of futures with daily margining, as mentioned earlier, are close to zero at the end of each day, and it is not necessarily cost effective to collect them. The outstanding amounts of initial margins paid are recorded as assets in the other investment account and the outstanding amounts of initial margins received are recorded as liabilities in the other investment account.

More specifically, the recording of futures should be as follows:

**Flows**

(i) **Non-repayable margins:** futures-style variation margin payments:
- amounts paid or received during the period are recorded under financial derivatives;
- the inflow (credit) of cash is regarded as a decrease in assets and the outflow (debit) of cash is regarded as a decrease in liabilities.

(ii) **Repayable margins:** initial margin payments:
- amounts paid or received during the period are recorded under loans/currency and deposits in the other investment account;
- the inflow (credit) of cash is regarded as a decrease in assets or increase in liabilities and the outflow (debit) of cash is regarded as an increase in assets or decrease in liabilities.

**Stocks**

(i) **Assets:**
- the sum of contracts with a positive market value at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins paid is recorded in the other investment account.

(ii) **Liabilities:**
- the sum of contracts with a negative market value at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins received is recorded in the other investment account.

3.9.3 OPTIONS

3.9.3.1 GENERAL CHARACTERISTICS OF OPTIONS

An option is an instrument that gives the purchaser the right, but not the obligation, to buy/sell a specified amount of a particular
financial instrument, or commodity from/to the writer (seller) of the option within a given period, or at some specific future time, at a specified price. Options can be either exchange-traded or over-the-counter (OTC) instruments. Exchange-traded options are packaged in fixed quantities and have a fixed range of dates. Options can be margined options-style (where there is an exchange of the initial premium, and daily variation margins may be covered by collateral rather than cash) or futures-style (where there is no initial premium and variation margins are settled in cash). OTC options, by contrast, are tailor-made to meet the customer’s requirements, and are therefore less suitable for trading on secondary markets.

At the inception of the contract, the purchaser of the option usually pays a premium to the seller. At maturity, the holder (buyer) of the option has the right, but not the obligation, to exercise the option. If the right is not exercised, the option expires and is worthless (the loss incurred by the buyer is equal to the premium paid).

If the option is exercised on the due date ("European style"; or within the specified range of dates, i.e. "American style"), then a net payment (representing the difference between the market price and the contractually agreed strike price) is usually made by the writer to the option holder. However, in some cases, instead of a net payment, a delivery of the underlying instrument or commodity takes place.

The percentage of the contracts reaching maturity (i.e. contracts which are not closed out prior to the expiry date), and the percentage of those that end with the delivery of the underlying instrument, vary considerably from market to market.

Different types of margin payments are made in the exchange-traded markets. The margin is a measure of risk to an institution that is counterparty to a contract. Margining takes two forms; an initial margin, to cover potential future adverse price movements, and a variation margin, to cover actual past price movements since the previous variation margin settlement. The initial margin is held as a deposit (or by posting collateral) for the duration of the contract which is returned when the contract expires. Variation margining is carried out either options-style or futures-style. The choice depends on the type of instrument and the practice applied by the exchange concerned. For example, equity options are often margined options-style, while interest rate options are usually margined futures-style.

In options-style margining, the purchaser of the option pays a premium to the seller and the writer posts an initial margin to the clearing house. Daily variation margin payments are made to the buyer only in proportion to the net liquidation value, since the clearing house covers itself against potential future price changes in favour of the writer. The buyer’s margin account can be fully realised only when the deal is closed out or the option exercised.

With futures-style variation margining, there is no premium and this is reflected in the price that the contract is quoted at; options that are margined futures-style can be regarded as similar to futures, except that the downside risk for the buyer is capped. Both the buyer and the seller are required to deposit initial margins. The daily variation margin payment is usually collected by the clearing house from one party – and simultaneously paid to the other party – and provides the means for effecting a change in ownership.

3.9.3.2 PRACTICAL TREATMENT OF OPTIONS WITH OPTIONS-STYLE MARGINING OPTIONS IN THE B.O.P./I.I.P.

OTC options and exchange-traded options with options-style margining involve a payment of the premium up front. The full premium should be recorded under financial derivatives as the acquisition of a financial asset by the buyer, and as the incurrence of a liability by the seller. At the close of the contract, the net payments that reflect the difference between the underlying market price and the strike price should also be
recorded under financial derivatives, regardless of whether the underlying instrument is delivered or not.

Any actual delivery of the underlying instrument should be treated as a separate entry in the financial account, and the transaction should be recorded at the prevailing market price. Both the premium at the start of the contract and net payments at the close of the contract are non-repayable to the payer (buyer or seller).

Initial margin payments, options-style variation margin payments or other collateral-type payments related to option contracts should be recorded as transactions under the other investment account, in currency and deposits. In principle, these are all repayable to the payer and should not therefore be regarded as transactions in financial derivatives. If a repayable margin is made in the form of securities or other non-cash assets, there will be no transaction recorded in the b.o.p., since no change of ownership takes place.

The market values of the option contracts at the end of the reference period should be recorded in the i.i.p. Purchased options are regarded as financial derivative assets and written options are regarded as financial derivative liabilities. The outstanding amounts of initial margins paid are recorded as assets in the other investment account and the outstanding amounts of initial margins received are recorded as liabilities in the other investment account.

More specifically, the recording of options with options-style margining (including OTC options) should be as follows:

**Flows**

(i) **Full premium and net payments at the close of the contract** (difference between the underlying market price and the strike price):
- amounts paid or received are recorded under financial derivatives;
- the purchase of an option (debit) is regarded as an increase in assets and the sale of an option (credit) is regarded as an increase in liabilities.

(ii) **Repayable margins** (exchange-traded options): initial margin payments (writer only) or options-style variation margin payments:
- net amounts paid or received during the period are recorded under loans/currency and deposits in the other investment account;
- the inflow (credit) of cash is regarded as a decrease in assets for the buyer of an option or an increase in liabilities for the writer of an option and the outflow (debit) of cash is regarded as an increase in assets for the buyer of an option or a decrease in liabilities for the writer of an option.

**Stocks**

(i) **Assets**:
- the market value of the purchased options at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins paid is recorded in the other investment account.

(ii) **Liabilities**:
- the market value of the written options at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins received is recorded in the other investment account.

### 3.9.3.3 Practical treatment of futures-style options in the B.O.P./I.I.P.

In the case of exchange-traded options with futures-style margining, payment of the premium does not take place at the start of the contract, and there is thus no transaction in financial derivatives at the start of the contract. Initial margin payments, which are repayable to the payer, should be recorded as transactions in
the other investment account. The futures-style variation margin payments that are made during the life of the contract (usually daily) are non-repayable in nature and should be recorded as transactions in financial derivatives.

In principle, the market values of exchange-traded options should be recorded as financial derivative assets and liabilities in the i.i.p. In practice, however, the market values of exchange-traded options with frequent margining are close to zero at the end of each day. (The market value of a futures-style margined contract can be argued to be equivalent to any unsettled variation margin payments, although this may be difficult, in practice, to report for many institutions. However, as the figures are relatively small, the collection of such data is of limited value.) The outstanding amounts of initial margins paid are recorded as assets in the other investment account, and the outstanding amounts of initial margins received are recorded as liabilities in the other investment account.

More specifically, the recording of futures-style options should be as follows:

**Flows**

(i) Non-repayable margins: futures-style variation margin payments:
- amounts paid or received are recorded under financial derivatives;
- the inflow (credit) of cash is regarded as a decrease in assets and the outflow (debit) of cash is regarded as a decrease in liabilities.

(ii) Repayable margins: initial margin payments:
- amounts paid or received during the period are recorded under loans/currency and deposits in the other investment account;
- the inflow (credit) of cash is regarded as a decrease in assets or an increase in liabilities and the outflow (debit) of cash is regarded as an increase in assets or decrease in liabilities.

**Stocks**

(i) Assets:
- the market value of the purchased options at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins paid is recorded in the other investment account.

(ii) Liabilities:
- the market value of the written options at the end of the period is recorded in the financial derivatives account;
- the outstanding amount of initial margins received is recorded in the other investment account.

### 3.9.4 SWAPS, FORWARDS AND FORWARD RATE AGREEMENTS

#### 3.9.4.1 GENERAL CHARACTERISTICS OF SWAPS, FORWARDS AND FORWARD RATE AGREEMENTS

**Swaps** are contractual agreements between two parties who agree to exchange sets of cash flows. Contracts are negotiated by the counterparties themselves and, in principle, the payment arrangements can be tailored to the wishes of the counterparties. However, standard conventions are followed in the most active swap markets, thus helping the b.o.p. compiler to set out instructions for reporting. In many markets, such as the interest rate swap market, the principal is not exchanged at the start of the contract. Nonetheless, in the case of cross-currency interest rate swaps, for instance, the principal is sometimes exchanged at the start of the contract. Interest payments are usually carried out on a net basis. Swaps are mainly OTC contracts, but exchange-traded contracts may also exist.

**A forward contract** is an agreement between two parties to purchase/sell something at a predetermined price at a later date. Forwards are always OTC contracts (by definition, a future is a forward that is traded on an exchange). Forward rate agreements (FRAs) are pure
interest rate forward contracts. While the instruments pose the same problems, differing market practices create unique practical issues.

For example, most FRAs are settled via a net cash payment at the end of the contract, whereas forward foreign exchange deals usually result in the delivery of the underlying instrument.

Swaps and forwards almost invariably go to maturity. The only way to offset a position is to enter into a new contract reversing the original, although it is rare for contracts to be formally closed out. Swaps, forwards and FRAs are instruments the value of which can switch from positive to negative and vice versa throughout the life of the contract.

3.9.4.2 PRACTICAL TREATMENT OF SWAPS, FORWARDS AND FORWARD RATE AGREEMENTS IN THE B.O.P./I.I.P.

Net payments related to swaps (including net interest) and forwards are recorded as transactions under financial derivatives. Depending upon the contract specifications, net payments relating to swaps can be made during the life of the contract or only when it reaches maturity. If principal is exchanged in a swap (especially in the case of cross-currency swaps), the possible difference between the two legs revalued in the base currency should be recorded under financial derivatives. Transactions relating to forward contracts invariably occur at expiry. Collateral payments are only rarely made from one counterparty to another, but when such cash payments do occur they should be recorded in the other investment account.

For forward foreign exchange contracts it is recommended that the difference between the amount paid on the contract date and the amount that would be paid at the spot rate prevailing at settlement should be allocated to transactions in financial derivatives. In settlement data collection systems in which amounts paid are reported it is, however, difficult or impossible to identify and separate the market price component. A survey data collection system is more practical, but the relatively heavy burden upon the respondents has to be judged according to local circumstances.

The market values of swap and forward contracts should be recorded in the i.i.p. Although the contract is usually negotiated so that it has zero marked-to-market value at inception, a contract will gain value for one party and become a liability for the other as market values change. The value of swap and forward contracts is derived from the difference between the agreed contract price and the prevailing market price, or the expected market price, which is discounted accordingly. Hence the relationship between the agreed contract price and the prevailing market price is a crucial element in the valuation of swap and forward contracts. If the agreed contract price and the prevailing market price are the same, the contract has no value. If the contract price and the prevailing market price differ, the derivatives contract does have a value, which can switch to being positive or negative during the life of the contract.

More specifically, the recording of swaps, forwards and FRAs should be as follows:

**Flows**
- **Swaps and FRAs** (net payments during the period or at the close of the contract) and **forwards** (the difference between the agreed contract price and the market price at the close of the contract):
  - amounts paid or received during the period are recorded under financial derivatives;
  - the inflow (credit) of cash is regarded as a decrease in assets or increase in liabilities and the outflow (debit) of cash is regarded as an increase in assets or decrease in liabilities.

**Stocks**
- **Assets:**
  - the sum of contracts with a positive market value at the end of the period.
(ii) **Liabilities:**
- the sum of contracts with a negative market value at the end of the period.

### 3.9.5 Criteria for the Geographical Breakdown

With regard to the geographical allocation of financial derivative transactions and positions, the following cases have to be distinguished:

(i) **For financial derivatives traded in specifically organised markets** (e.g. futures and options, except OTC paper), information on the residency of the ultimate investor is not usually available. The clearing houses search the market for opposite orders which match each other. Since each market participant holds a position vis-à-vis the market, which requires all participants to provide margins for open positions, usually day-by-day, the ultimate risk of the counterpart is determined solely by the central clearer. Therefore, as a practical solution, the country in which the clearing house is located should determine the geographical allocation of assets and liabilities associated with such financial derivatives. Where such practices are significant, it is recommended that the clearing houses themselves are included in the population of reporting agents in order to ensure full coverage and a correct allocation between domestic and external transactions/positions.

(ii) **Non-negotiable OTC financial derivatives** (e.g. most types of swaps and FRAs) are in principle not traded in organised markets, since they are designed to meet the specific needs of the parties involved. In the case of these kinds of contracts, the counterpart and its actual location can be identified.

(iii) **Other negotiable financial derivatives** (e.g. some types of options, warrants, etc.) are instruments which may be actively traded in secondary markets. Identifying the ultimate holder of liabilities poses the same problem as for financial instruments in the portfolio investment account, meaning that only the first known counterpart to which the financial derivative was initially sold might be determined.

### 3.10 Other Investment

#### 3.10.1 Definition and Coverage

The other investment item is a residual category that includes all financial transactions not covered under direct investment, portfolio investment, financial derivatives or reserve assets (see also Sub-section 3.8.4 “Borderline cases” for portfolio investment). Other investment can be further subdivided into (i) trade credits, (ii) loans/currency and deposits and (iii) other assets/other liabilities. It also encompasses the offsetting entries for accrued income on instruments classified under other investment.

**Trade credits** consist of claims or liabilities arising from the direct extension of credit relating to transactions in goods and services and advance payments for work in progress (or to be undertaken) associated with such transactions. There are two types of trade credit assets: (i) prepayments on imports and (ii) trade credit extended on exports. Assets represented by prepayments on imports are extinguished upon delivery of the goods or services and assets represented by trade credit on exports are extinguished by actual payment (post-payment). Trade credit liabilities arise from the pre-payment of exports or trade credit received on imports. Delivery of exports extinguishes the former and actual payment (post-payment) extinguishes the latter.

**Loans/currency and deposits** comprise transactions in the following financial instruments: loans, i.e. those financial assets created through the direct lending of funds by a creditor (lender) to a debtor (borrower) through
an arrangement in which the lender either receives no security evidencing the transaction or receives an effectively non-negotiable document or instrument; deposits; repo-type operations (see Sub-section 3.10.2 “Repurchase agreements, bond lending and other related instruments”) and currency (notes and coins which are in circulation and commonly used to make payments). Included are, inter alia, loans to finance trade, other loans and advances (including mortgages). In addition financial leases are covered.

*Other assets/other liabilities* covers all items other than trade credits, loans and currency and deposits. Examples are: capital subscriptions of the participating Member States to international non-monetary organisations, changes in insurance technical reserves, offsets in respect of unsettled securities transactions.

Compared with BPM5 standard components, the other investment presentation of the euro area b.o.p/i.i.p. is simplified by (i) not requiring any distinction between loans and deposits on each side of the b.o.p/i.i.p., and (ii) the removal of the maturity breakdown for quarterly/annual b.o.p. and i.i.p. statistics. There is also a change in the presentation of the breakdown (i.e. sector as first priority) which is compatible, but not identical, with the BPM5 where instruments have priority. For the monthly key items, a split between short-term and long-term flows in the banking sector is required.

### 3.10.2 Repurchase Agreements, Bond Lending and Other Related Instruments

The statistical treatment of repo-type transactions is a complex issue where standards at the global level are still the subject of debate. Within the euro area, the following consensus treatment has been agreed.

#### 3.10.2.1 Definition of Repurchase Agreements

Under a repurchase agreement (repo) the holder of a bond sells the bond for cash but agrees to repurchase the bond, or an equivalent security, at a fixed price on a fixed date. There is a formal contract between the two parties, which sets out the legal standing of the transaction. In London and elsewhere, this is the PSA/ISMA Global Master Repurchase Agreement. The contract allows for margining, marking to market, collateral substitution and manufactured dividends.

If a coupon is paid during the life of the repo it is passed on to the original holder (lender) of the securities.

Under a repo agreement, there is an *obligation* to return the securities. Such instruments are “genuine” repurchase agreements.

In some Member States there are instruments which appear to be similar to genuine repo agreements or have the same name, but which do not entail an obligation to return the underlying securities; instead, there is an “option” to return them. These instruments are, for example, “unechte Wertpapierpensionsgeschäfte” or “spurious repurchase agreements” (Germany, Luxembourg, Austria and Italy), “Réméré” (France) and “outright sale with an option to buy back” (Denmark and Portugal). Such transactions should be recorded under portfolio investment, i.e. the recommendations outlined in this section do not apply to them.

#### 3.10.2.2 Definition of Sell/Buy-Back Transactions

Like repurchase agreements, sell/buy-back transactions are often a way of raising or lending short-term capital which is secured against securities, sold or purchased. In contrast to repurchase agreements, the transaction is structured in two parts, a spot deal and a forward deal, which are, however, executed simultaneously. As for repurchase agreements the original holder of the securities received benefit of a coupon payment made during the duration of the transaction, but the method of passing it is different. The main difference between repurchase agreements and sell/buy-back transactions revolves around
settlement systems required for the two types of transactions. Repurchase agreements can be considered a technical evolution of sell/buy-back transactions. Under a sell/buy-back transaction, there is an obligation to return the securities.

3.10.2.3 DEFINITION OF BOND LENDING
Bond lending either involves the lending of securities (collateralised by cash or marketable paper) or the payment of the fee for the bonds lent without any capital transfer involved. Under lending of securities collateralised by cash or marketable paper, the borrower can sell or hold these securities, or deliver the securities under a futures or options contract. The collateral, if cash, will most likely be invested and the borrower of the securities will be paid a rate of interest. Coupon payments on the bonds belong to the original owner.

3.10.2.4 RECORDING OF REPURCHASE AGREEMENTS, BOND LENDING AND OTHER RELATED INSTRUMENTS
The treatment recommended by the ECB is based on the notion of transfer of “economic” or “beneficial” ownership as distinct from transfer of “legal” ownership. All repo-type operations, i.e. “genuine” repurchase agreements, sell/buy-back operations and bond lending (in the case of the latter, only if cash collateral is involved), are treated as collateralised loans in the euro area b.o.p./i.i.p., not as outright purchases/sales of securities, and are recorded under other investment, within the euro area resident sector that carries out the operation. This treatment, which is also in line with the accounting practices of banks and other financial corporations, is intended to reflect the economic rationale behind these financial instruments. The firm commitment to repurchase the securities implies that the economic ownership remains with the original owner, who retains the risks and rewards associated with that ownership, while not necessarily retaining legal title. Such a procedure is, in addition, consistent with the treatment in money and banking statistics and with the current practice in the MFI sector.

As regards other features of repo-type transactions: (i) fees associated with securities-lending operations should be recorded as financial services, instead of as investment income in the b.o.p., and (ii) repayable (option-style) variation margins provided to cover the value of the securities placed as collateral should be recorded as deposits within the other investment account.

3.10.3 TREATMENT OF INTRA-ESCB TRANSACTIONS
Among the transactions between the members of the European System of Central Banks (“intra-ESCB” transactions), only those involving the NCB of a euro area Member State and the NCB of a non-euro area Member State are in principle relevant to the compilation of the euro area aggregates. However, in some areas, asymmetric statistical treatment even within the Eurosystem would lead to distortions in the euro area b.o.p. as a result of the method used to compile some of the euro area aggregates (e.g. portfolio investment and income on portfolio investment). The harmonised rules are described in detail in Sub-section 3.10.3.1.

All operations described in Sub-section 3.10.3.1 are settled via TARGET. Therefore, the treatment of the required offsetting entries, as required by the double-entry structure of the b.o.p., follows the agreed treatment of changes or positions in TARGET balances as described in Sub-section 3.10.3.2.

3.10.3.1 HARMONISED TREATMENT OF INTRA-ESCB OPERATIONS
The treatment of specific intra-ESCB transactions (and positions where appropriate) is the following:

- **Initial transfer of reserve assets**: EUR claims on the ECB resulting from the initial transfer of international reserves from NCBs to the ECB should be recorded under “other investment/monetary authorities/assets/currency and deposits”. 
– Shares of the ECB: the NCBs should record their participation in the ECB’s capital under “other investment/monetary authorities/assets/other assets”.

– Reallocation of monetary income is treated as an intra-euro area current transfer, either positive or negative, on a gross basis, i.e. identified separately from any other transaction (such as coverage of ECB losses), under “current account/current transfers”.

– Distribution of ECB profit to NCBs and coverage of ECB financial losses by NCBs are considered as positive or negative income (as appropriate) accruing on the share of each NCB in the capital of the ECB. Thus, they are recorded as intra-euro area transactions under “current account/investment income/income on other investment”.

– Intra-Eurosystem (“technical”) balances resulting from the issuance and circulation of euro banknotes are not considered as “external” and therefore they are not included in the national b.o.p./i.i.p. The remuneration of these technical balances is treated in the national b.o.p. as redistribution transfers and is thus recorded under “current account/current transfers”.

– Remuneration of intra-ESCB balances is treated as income on deposits and recorded under “current account/investment income/income on other investment”.

– Proceeds from sanctions imposed by the ECB: in accordance with Article 3.9 of Council Regulation (EC) No 2532/98 of 23 November 1998 concerning the powers of the ECB to impose sanctions, these proceeds belong to the ECB. The NCB which holds the account of the market participant concerned debits the latter’s current account for the amount of the financial sanction and transfers this amount to the ECB. In b.o.p. statistics, NCBs consider these transactions as “current account/current transfers”.

– Remuneration of the claims on the ECB resulting from the transfer by NCBs of pooled reserve assets is considered as an intra-euro area income payment and recorded under “current account/investment income/income on other investment”.

– Collateral exchanged under the correspondent central banking model (CCBM) in the event of redemption, coupon payments, fees, etc.: in line with ECB recommendations, the NCBs of the countries of residence of the issuer and the ultimate holder record these b.o.p. transactions as intra-euro area or extra-euro area flows, respectively, and allocate them to the relevant sector under “financial account/portfolio investment”. Countries not yet fully applying the accruals principle should record coupon payments under “current account/investment income on portfolio investment”.

3.10.3.2 BALANCES FROM TARGET OPERATIONS
Since the start of Stage Three of EMU in 1999, cross-border transactions within the ESCB have largely been executed via TARGET, giving rise to daily intra-ESCB positions/balances. The economic and functional rationale behind these intra-ESCB transactions/balances, which are denominated in euro, is similar to that behind the movements of nostro/vostro accounts.

In order to simplify the recording procedures, it was agreed that, as of 30 November 2000, all TARGET-related bilateral claims and liabilities would be netted at the end of each day within the ESCB in such a way that each participant would hold only one single (net) position exclusively vis-à-vis the ECB. The ECB performs the role of a central clearing house within the Eurosystem and is the sole holder of overnight TARGET balances vis-à-vis the NCBs of the non-euro area Member States. In other words, the TARGET balances of the ECB represent the euro area TARGET balances vis-à-vis those EU Member States which are not participating in the euro area.

Since the TARGET legislation does not allow for granting overnight credit to the NCBs of non-euro area Member States, the Eurosystem may only hold aggregated overnight debit balances vis-à-vis these NCBs. Accordingly,
the net positions and changes in the TARGET balances of the Eurosystem vis-à-vis the NCBs of non-euro area Member States are recorded under “other investment/liabilities” of the sector “monetary authorities” as “loans, currency and deposits” within the euro area i.i.p. and b.o.p.

### 3.10.4 Non-euro area resident holdings of euro banknotes

Both the b.o.p. and the i.i.p. of the euro area incorporate an adjustment for the holdings of euro banknotes by non-euro area residents. This adjustment is recorded under “other investment/liabilities, loans/currency and deposits of the Eurosystem”. Initially, the adjustment was mostly intended to take into account the effect of the euro cash changeover on b.o.p. transactions in 2002 and was based on euro banknote shipments from/to euro area MFIs. Since 2003, holdings of euro banknotes by non-residents have been estimated using a variety of indirect methods.

### 3.10.5 Recording of MFIs’ transactions in loans and deposits

In the euro area b.o.p., “other investment” of the MFI sector (excluding the Eurosystem) has proved to be a difficult item, in particular with regard to the compilation of the geographical breakdown of these flows. A common method to derive extra-euro area b.o.p. flows from MFIs’ balance sheet stocks must be applied in those cases where these flows cannot be directly obtained from the b.o.p. collection system in place. This procedure consists of (i) converting the stocks at the beginning of the monthly reporting period and those at the end of period into original currencies by applying the mid-point foreign exchange rate corresponding to the currency proportion of the stock as at the beginning of the quarter and (ii) converting the differences in these stocks into euro by using the average exchange rate of the month.

### 3.10.5 Special issues related to stocks

#### 3.10.5.1 Valuation proposals

In the case of the other investment holdings, the discrepancies between the market value and the nominal or book value can be considered to be rather smaller than for other financial instruments, except in cases where there have been large write-downs or valuations are based on secondary market quotations. For these reasons, book values are accepted as the valuation criteria for other investment stocks, except for loans that are negotiable at a discount where market value should be applied.

Valuation problems for applying the proper end-of-period exchange rates may arise if the currency composition of the underlying other investment instruments is not well known. This is the case, in particular, for special financing instruments, such as multi-currency loans, where the borrower can instantaneously change the optional currency, at his own convenience, for the drawdown, repayment and restatement throughout the duration of the loan. Consequently, movements in these loans can occur in several currencies. In these cases, it is recommended to translate each movement in the loan, irrespective of its currency, into the currency in which the loan was initially extended by using the exchange rate prevailing at the date of the movement. The amount in the basic currency should then be converted into euro at the closing mid-market exchange rate prevailing at the end of the period. The result may be a fairly accurate approach to the real valuation, except when strong fluctuations occur in the value of the currencies in question.

A similar effect occurs when the borrower arranges exchange rate hedges or swaps on the principal with a non-resident. Borrowers often receive a loan in one currency and then swap or sell the amount obtained against the equivalent amount in another currency. Since it is not easy to obtain information about the exchange rate involved in the swap, the same valuation problems may arise as those described for multi-currency loans.
3.10.5.2 ISSUES RELATED TO THE ACCUMULATION OF FLOWS

The unadjusted accumulation of flows can lead to unrealistic stock estimates for other investment since stock data valuation changes caused by exchange rate fluctuations can be significant, especially if (i) the relevant exchange rates are volatile, (ii) the turnover of the assets is high and (iii) the net movement in the stock is low. Therefore, exchange rate adjustments using the actual exchange rates at the time of the transaction and closing mid-market exchange rates at the end of the period are strongly recommended where other investment stocks are derived on the basis of accumulated flows. If the actual exchange rate cannot be applied on a transaction-by-transaction basis, the average exchange rate of the period may be used as a proxy.

Further difficulties may arise in the case of multi-currency loans if the loan operation is linked to an additional swap operation. In line with the valuation proposals for stocks, the most feasible solution would be to translate each of these loan movements into the basic currency in which the loan was initially extended. Exchange rate adjustments may here be calculated by converting transactions into euro at the average exchange rate in the period.

3.11 RESERVE ASSETS

3.11.1 DEFINITION OF THE EUROSYSTEM’S RESERVE ASSETS

The definition of the Eurosystem’s international reserves was approved by the ECB Governing Council in March 1999. The reserve assets of the euro area consist of the Eurosystem’s reserve assets, i.e. the ECB’s reserve assets and the reserve assets held by the NCBs of the participating Member States (see also the ECB publication entitled “Statistical treatment of the Eurosystem’s international reserves”, October 2000, http://euroweb/website/pub/pdf/statintreserves.pdf).

Reserve assets must (i) be under the effective control of the relevant monetary authority, either the ECB or the NCBs of the participating Member States, and (ii) refer to highly liquid, marketable and creditworthy foreign (i.e. non-euro) currency-denominated claims on non-residents of the euro area – plus gold, Special Drawing Rights (SDRs) and the Reserve Positions in the IMF of the participating NCBs. This definition expressly excludes foreign-currency claims on residents of the euro area, and euro claims on non-residents of the euro area, from being considered to be reserve assets either at the national or at the euro area level.

Although governments may hold working balances in foreign currencies, foreign exchange positions of central governments and/or the Treasury are not included in the reserve assets definition for the euro area in accordance with the institutional arrangements in the Treaty establishing the European Community. Article 105 (2) of the Treaty, in conjunction with Article 116 (3), gives the Eurosystem the exclusive right to hold and manage the official foreign reserves of the Member States from the beginning of Stage Three of EMU.

The off-setting entries for accrued interest on reserve assets should be recorded within the relevant reserve assets items.

Reserve assets data are compiled on the basis of the information provided by the accounting or operation departments of the NCBs forming part of the Eurosystem and of the ECB.

3.11.2 CONCEPT OF GROSS RESERVES

Against the background of the Asian crisis, the concept of usable reserves has gained importance. This concept supplements data on the gross reserves with information about commitments relating to reserves, i.e. the so-called reserve-related liabilities, and might be an important indicator of a country’s ability to meet its foreign exchange obligations. However, it was agreed that reserve assets
presented on a gross basis without any netting-off of reserve-related liabilities should remain the central indicator of a country’s ability to meet its foreign exchange obligations. (The only exception relates to the sub-category of financial derivatives, which are recorded on a net basis; see Sub-section 3.11.8).

3.11.3 VALUATION PRINCIPLES

In principle, the valuation of reserve assets is based on market prices by using (i) the prevailing market prices at the time when the transaction takes place for transactions and (ii) the closing mid-market prices at the end of the appropriate period for positions. Gold should be valued at the closing market price (gold fixing usually quoted in terms of US dollars per fine troy ounce) prevailing at the end of the reference period. Prevailing market exchange rates at the time when the transaction takes place and closing mid-market prices at the end of the appropriate period are respectively used for the conversion of transactions in and holdings of foreign currency-denominated assets into euro.

However, since the information for the compilation of reserve assets statistics is mostly obtained directly from accounting statements, information on marked-to-market values may not be available each month.

Accordingly, the following practical rules for the valuation of euro area reserves may provide a proxy for a market valuation of international reserves:

(i) taking the stocks of each instrument in the original currency as disclosed in accounting statements on the basis of marked-to-market valuation on a quarterly basis only; and

(ii) converting these stocks into euro using the mid-point foreign exchange rate of the last day of the reporting period (i.e. on a monthly basis).

3.11.4 SPECIFIC ISSUES RELATED TO GOLD

With regard to outright purchases and sales of gold, in line with BPM5 recommendations, only gold transactions in which both counterparts belong to the “monetary authorities” institutional sector (including international monetary organisations) should be recorded under reserve assets (sub-item “monetary gold”) in the b.o.p. When at least one counterpart is not a monetary authority, gold transactions vis-à-vis non-residents should be recorded under the goods item of the b.o.p. current account. The consequent monetisation/de-monetisation of the gold would induce increases/decreases in the monetary gold position of the monetary authority involved. However, this reclassification of the gold should only give rise to entries in the “other adjustments” column of the i.i.p., without any recording in the b.o.p.

As regards reversible transactions in gold (swaps, repos, loans and deposits), the statistical treatment of the gold is similar to that of securities: neither lending of gold nor delivery of securities collateral would involve any recording in the b.o.p. or the i.i.p., i.e. holdings of monetary gold would remain unchanged. Only the foreign exchange cash delivered in gold swaps/repos would be recorded under reserve assets (sub-item “foreign exchange/currency and deposits” matched by an entry in “other investment/monetary authorities/liabilities”).

3.11.5 SPECIFIC ISSUES RELATED TO THE POSITIONS VIS-À-VIS THE IMF (INCLUDING SDRS)

For statistical purposes, SDR accounts reflect the same rationale as traditional correspondent bank accounts, i.e. variations in these accounts may constitute offsetting entries for the rest of the cross-border b.o.p. flows. Transactions/positions in these accounts should be recorded under reserve assets (sub-item “SDRs”).

8 This concept has been developed by the IMF in the context of the Special Data Dissemination Standard.
Allocation/cancellation of SDRs should not give rise to any entry in the b.o.p., although changes in the stock of SDRs would be reflected in the i.i.p., by means of entries in the other adjustments column, thus permitting a reconciliation between flows and stocks of SDRs.

The operations related to the reserve position in the IMF should be recorded under the sub-item of the same name. Consequently, no entry under sub-item “SDRs” should be derived from movements in this position, despite their being denominated in SDRs.

Purchases of foreign currency using the Fund’s General Resources Account by drawing on the position in the Fund should be regarded as reclassifications of reserve assets, thus not altering the total level of reserves. Such transactions cause increases in holdings of foreign exchange and symmetrical decreases in the reserve position in the Fund. Repurchases represent reverse transactions and would therefore give rise to similar but reverse entries.

Claims on the IMF arising from Fund financing under the “New Arrangements to Borrow” (NAB) and the “General Arrangements to Borrow” (GAB) should be reflected in the sub-item “Reserve position in the IMF”. However, claims arising from commitments under the “Enhanced Structural-Adjustment Facility” (ESAF)⁹ should be treated statistically as deposits, and should thus be allocated to the sub-item “foreign exchange/currency and deposits”.

3.11.6 SPECIFIC ISSUES RELATED TO SECURITIES

Only foreign currency-denominated securities issued by non-residents of the euro area can be included in the category of reserve assets. The accruals principle should be applied for all types of securities under reserve assets, including zero coupon bonds (see Sub-section 3.4.7.2 “Specific issues related to income on reserve assets”). Securities lending would not give rise to any entry under securities; only in the event of cash exchanges, would transactions be treated as collateralised loans.

3.11.7 SPECIFIC ISSUES RELATED TO CURRENCY AND DEPOSITS

Only foreign currency-denominated deposits placed with credit institutions located outside the euro area can be considered to belong to the category of reserve assets. This category indistinguishably includes holdings of transactions in foreign currency notes and coins, in line with the treatment proposed in the IMF’s operational guidelines. It should be noted that foreign currency-denominated deposits placed with branches and/or subsidiaries of euro area resident MFIs which are located outside the euro area are considered to be reserve assets of the euro area.

Deposits and loans should be distinguished in accordance with the economic nature of the counterpart. Transactions in which the counterpart is an NCB or any other financial institution should be treated as deposits, while they should be classified as loans in the case of all other counterparts. In this context, the term “financial institution” should be understood in a broad sense, encompassing any type of counterpart of a financial nature.

Claims on external portfolio managers (not necessarily included in the category of credit institutions) arising from funds sent abroad and subsequently invested in other foreign currency financial instruments should, in principle, be classified in each prescribed category. Nevertheless, should NCBs not have access to information on the final destination of these funds, they should be recorded under the sub-item “foreign exchange/currency and deposits” in the b.o.p. and the i.i.p.

Foreign currency loans to non-financial non-residents that fulfil the necessary conditions to be included in the category of reserve assets

⁹ Replaced from 2000 onwards by “Poverty Reduction and Growth Facility” (PRGF).
will be recorded under the sub-item “other claims” in the b.o.p and the i.i.p.

Claims arising from reverse repurchase agreements, securities lending transactions (in the case of the latter, only if cash collateral is involved) and buy/sell—back operations should be treated as collateralised loans/deposits and are, in euro area statistics, recorded either (i) under “foreign exchange/currency and deposits” where the counterpart is a non-resident bank or (ii) under “other claims” where the counterpart is a non-resident non-bank. The treatment (i), where the counterpart is a non-resident bank, differs slightly from IMF recommendations which classify such claims as “other claims”.10 Securities temporarily exchanged as collateral in these types of operations would not give rise to any b.o.p./i.i.p. entry.

Liquid claims arising from taken-up credit lines conceded by monetary authorities could be considered to be in the category of reserve assets, provided that the correspondent counterpart is highly creditworthy. Reciprocal currency arrangements among central banks and with the Bank for International Settlements enter into this category, as well as other financing agreements between central banks and consortia of private financial institutions.

3.11.8 SPECIFIC ISSUES RELATED TO FINANCIAL DERIVATIVES

Financial derivatives are recorded and presented as a separate item within reserve assets. All recommendations in this field are fully in line with the ESCB general recommendations on financial derivatives (see Section 3.9 “Financial derivatives”).

Both transactions and positions are recorded on a net basis (i.e. including both positive and negative positions) even though, in the case of positions, this constitutes a deviation from the gross reserve assets concept. However, the application of net recording is the only feasible way to reconcile flows and stocks related to financial derivatives transactions in/holdings of reserve assets. Moreover, liquid positions in financial derivatives settled in at least one foreign currency vis-à-vis creditworthy non-resident counterparts would be computed under reserve assets on a marked-to-market basis, i.e. including all unrealised gains and losses associated with changes in prices and foreign exchange rates. The inclusion of both positive and negative stocks under reserve assets on a net basis could result in negative positions, especially in the case of interest rate derivatives.

In line with the general treatment of positions in financial derivatives (see Section 3.9), the net marked-to-market value is recorded in the case of financial derivatives falling into the category of reserve assets. As regards OTC derivatives, each national compiler must decide whether claims arising from such financial derivatives (for instance, swap agreements or some types of options) might be included in the category of reserve assets, which depends especially on whether such a financial instrument may be offset in the market, and whether a prevailing price for the underlying assets permits this.

3.11.8.1 OPTIONS

In the case of options margined options-style, the full premium paid (i.e. the purchase price plus the implied service charge) would be recorded under the sub-item “foreign exchange/financial derivatives” (accounting for the acquisition of a financial asset). According to the above-mentioned “net-basis” treatment, if a

10 Reverse repos, which do not differ substantially from normal (non-collateralised) loans/deposits, involve the substitution of one type of reserve asset (i.e. the amount of foreign currency provided) with another (i.e. a claim backed by collateral), provided that the counterpart is highly creditworthy. Therefore, when the non-resident counterpart is a credit institution (including other NCBs), the NCB lending the cash does not register any variation in the total amount of “reserve assets/currency and deposits”. Moreover, in accordance with the treatment of foreign currency loans, if the counterpart of a reverse repo transaction were neither a credit institution nor a financial intermediary/external manager, a decrease in holdings of “reserve assets/currency and deposits” and an increase in “reserve assets/other claims” would be registered in the b.o.p. reserve assets account, thus not affecting the total level of reserves.
3.11.8.1 CENTRAL BANKS

Central bank sells an option (“option written” by the NCB), the premium received would then be symmetrically recorded under this sub-item with a negative sign (accounting for a liability). However, in the case of cash margin payments and receipts associated with options, they should be classified under the sub-item “foreign exchange/currency and deposits” in the b.o.p., provided that no real change in ownership occurs before the conclusion of the contract.

If the option is finally exercised and the underlying asset is delivered to the owner of the option, the prevailing market price of the underlying asset should be recorded under the appropriate item in the b.o.p. The difference between the market and the strike price should be recorded under the sub-item “foreign exchange/financial derivatives”, irrespective of whether it implies a payment or a receipt. This treatment would be the same for both call and put (either bought or written) options.

3.11.8.2 FUTURES

With regard to futures, futures-style variation margin payments should be recorded under the sub-item “foreign exchange/financial derivatives”. This is because daily variation margin payments are usually collected by the clearing house from one party and paid to the other, accounting for an actual change in ownership. This treatment of variation margins would be consistent with market stock values near to zero at the end of each day (unrealised profits and losses during the day would in the end become realised and be transferred to/received from the corresponding counterpart). Hence, there should be no recording of stocks of futures with daily margining.

3.11.8.3 INTEREST RATE DERIVATIVES

As regards financial derivatives with an interest rate component (namely interest rate swaps, cross-currency swaps and forward rate agreements), the net stream of cash settlement flows associated with this component should be recorded under the sub-item “foreign exchange/financial derivatives” in the b.o.p. In addition, the difference between the two legs of a cross-

currency swap, corresponding to the principal exchanged in terms of the base currency, should also be recorded under this sub-item of reserve assets.

3.11.8.4 FORWARD FOREIGN EXCHANGE CONTRACTS

The difference between the amount agreed at the time of the contract and the amount that would be paid at the spot rate prevailing at settlement should be allocated to transactions in reserve assets/foreign exchange/financial derivatives.

3.11.8.5 SWAPS OF FOREIGN EXCHANGE AGAINST DOMESTIC CURRENCY

The statistical treatment of these transactions is equivalent to considering independent spot and forward purchases/sales of foreign exchange against domestic currency. At the moment of delivery, an increase/decrease in foreign exchange should be reflected under the sub-item “foreign exchange/currency and deposits” in the b.o.p. The difference between the actual (agreed) and the market price of the transaction should be reflected under the sub-item “foreign exchange/financial derivatives”. 

4 COUNTRY-SPECIFIC DETAILS: EU MEMBER STATES

4.1 BELGIUM

I ORGANISATION CHART
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Belgian-Luxembourg Economic Union (BLEU) was initiated in 1921 when the official agreement confirming the monetary association between the two countries was signed. In 1944 the Belgian-Luxembourg Exchange Institute (BLEI) was set up for foreign exchange control purposes. From the very outset, the information collected in the framework of the exchange control was used as basic data to produce a joint balance of payments (b.o.p.) for the two countries. Capital movements were gradually liberalised from 1950 onwards. In 1990 the last remaining foreign exchange control, the two-tier foreign exchange market, was abolished. Consequently, the task of the BLEI became a purely statistical one.

Under the intergovernmental agreement, dated 23 November 1998, between Belgium and Luxembourg, the BLEI was in charge of the collection of data until December 2001. The Nationale Bank van België/Banque Nationale de Belgique (NBB/BNB) was in charge of the compilation of the BLEU b.o.p. and i.i.p., covering data until 2001, and has been responsible for the Belgian b.o.p. and i.i.p. since January 2002.

2.2 LEGISLATIVE PROVISIONS

The current data collection system is defined in the law of 28 February 2002 concerning the regulation of the establishment of the balance of payments and the international investment position of Belgium. The Royal Decree necessary for its full application is dated 19 March 2002. The related adapted regulations have been published by Ministerial Decree, dated 6 June 2002.

2.3 INTERNAL ORGANISATION

The Balance of Payments Division of the NBB/BNB collects data from credit institutions and enterprises and carries out data control and data processing functions. The resolution of methodological issues related to the b.o.p. and its compilation are among the statistical tasks performed by the NBB/BNB.

The structure of the Balance of Payments Division of the NBB/BNB reflects the new data collecting, processing and compilation system, which includes surveys on stocks (trade credits, direct investment and portfolio investment). At present, it consists of five sections which deal with:

- data collection and validation controls;
- the current account and the new capital account;
- the financial account and the international investment position;
- compilation and dissemination;
- the organisation of surveys.

The Balance of Payments Division has 65 full-time staff members.

Some of the data on the balance sheets of companies which are collected by the Data Exchange Department are currently used for checking and validation purposes.

The Balance of Payments Division of the NBB/BNB is responsible for:

- the full b.o.p. of the BLEU, covering data until 2001;
- the current account of Belgium for the period from 1995 to 2001;
- the full b.o.p. of Belgium since January 2002;
- the i.i.p. of both the BLEU (until 2001) and Belgium (including external debt statistics);
- the common template on international reserves defined by the IMF/BIS;
- the CPIS; and
- FDI statistics.

The Balance of Payments Division and the Research Department of the NBB/BNB liaise closely with one another. The latter was responsible for compiling the b.o.p., on the
basis of data collected by the BLEI, from 1947 to 1993. Since then, the Balance of Payments Division has been an autonomous entity, but the Research Department is still responsible for analysing data and for producing estimates for the current year, as well as short-term estimates. It carries out comparisons with various other types of statistics, such as the national accounts, and investigates their coherence.

In 1999 the former Research Department of the NBB/BNB was reorganised so as better to reflect the new environment of the b.o.p. as a result of the implementation of EMU and the introduction of the euro.

The current structure of the Research Department is characterised by the priority given to the national dimension of economical analysis. As a result, the former balance of payments unit has disappeared and its activities integrated in two, likewise fully reorganised units, one of which is devoted to the real accounts, while the other is devoted to the financial accounts, both including the respective rest-of-the-world component. The short term b.o.p. projections are still made by the Research Department.

2.4 EXTERNAL CO-OPERATION

The NBB/BNB co-operates closely with the National Accounts Institute (NAI) in order to obtain data concerning goods which are based on the foreign trade statistics compiled by the NAI. On the other hand, the co-operation between the NBB/BNB and the national statistical institute (NSI) is limited as far as the b.o.p. and the i.i.p. are concerned. Since 2002, however, the NBB/BNB has received supplementary information from the NSI in order to compile the tourism component of the b.o.p.

2.5 USERS

The NBB/BNB is responsible both for reporting to international organisations and for publishing all related statistics. International organisations, such as the ECB, the International Monetary Fund (IMF), the Statistical Office of the European Communities (Eurostat), the Organisation for Economic Co-operation and Development (OECD) and the Bank for International Settlements (BIS), are provided with data on the BLEU b.o.p. and, from 2002 onwards, on the b.o.p. of Belgium.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The collection system used to report statistical data for the b.o.p. is an international transactions reporting system (ITRS) which is based on the collection of settlements. Data concerning goods, however, are based on the foreign trade statistics compiled by the National Accounts Institute.

For some components of the current account administrative sources are used:

- income of employees – social security information;
- transactions of the European institutions; and
- insurance data from the supervisory authority for insurance companies.

In order to produce a sectoral breakdown of portfolio investment and other investment for the banking sector, b.o.p. flows are derived from the balance sheets of banks.

Furthermore, for portfolio investment, some flow data are adjusted on the basis of specific statistics from general government. In addition, for flows of direct investment, some adjustments are made on the basis of information taken from specialised media.

Within the framework of the i.i.p., stock data are used for the banking sector and general government, as well as stock exchange information for the adjustment of prices relating to portfolio investment.
For the reserve assets component of the b.o.p., as well as for the new international reserves template and the corresponding i.i.p. components, data provided directly by the Accounting Division of the NBB/BNB are used, together with information provided directly by the operational unit in charge of the execution of transactions in these assets.

3.2 REPORTING AGENTS

(i) **Banks**: These are banks and other financial institutions, as defined in the Second EU Banking Directive. Coverage is extended to include non-bank institutions in order to cover the Monetary Financial Institution (MFI) sector. The “Office des Chèques Postaux”, Belgium, is assimilated to a credit institution for b.o.p. reporting purposes. Banks are required to report all external transactions above certain thresholds (see Sub-section 3.3) undertaken on behalf of their customers and for their own account. These reports are established on a daily basis and in the original currencies. Moreover, they report their assets and liabilities vis-à-vis non-resident counterparts on both a monthly and a quarterly basis, information that is integrated in balance sheet reporting since June 2002. Since 1 January 1999, data related to the currencies of countries which now form part of the euro area have been reported in euro.

(ii) **Direct respondents**: Enterprises have to report all transactions settled through a channel other than resident credit institutions directly to the NBB/BNB. This reporting covers bank accounts abroad, netting procedures and current accounts. Some general direct respondents (GDRs) (similar to the French general direct reporting companies, or DDGs) report directly to the NBB/BNB on all transactions with non-residents. These reports are denominated either in the original currencies or, as from 1999, in euro.

(iii) **Monetary authorities**: The NBB/BNB provides data on reserve assets and other transactions of the monetary authorities.

The NBB/BNB is authorised to organise surveys for the compilation of the b.o.p./i.i.p. At the moment, three surveys have been developed, namely:

3.3 THRESHOLDS

Exemption and justification thresholds are applied in the NBB/BNB collection system.

An exemption threshold is applied and set at €12,500 for both receipts and expenditures. Below this threshold, no information whatsoever is required.

For transactions above this exemption threshold, the economic nature of the transaction, the identity of the resident and the country of residence of the counterpart have to be supplied. In addition, for reports on outgoing payments, a written justification is required for amounts in excess of €12,500, given that this information should be readily available, as customers have to fill in a payment order for the bank. In view of the fact that written justification is far more burdensome in the case of incoming payments, because the resident receives the money before the reporting form is completed, the threshold for written justification has been raised to €625,000.

3.4 AVAILABILITY OF DATA

Separate current accounts for Belgium and Luxembourg have been established since 1995. However, for the purposes of the financial account, monthly, quarterly and annual data were only available for the BLEU until 2001. A complete Belgian b.o.p. (monthly, quarterly and annual data) has been made available since 2002 in accordance with most of the major IMF standard components, together with a full geographical breakdown. However, the geographical allocation for some estimates made at a high level of aggregation is still very limited. The estimation procedures will be improved in the future.

3.5 TIMELINESS

The reporting banks have five working days to submit their daily reports. Direct respondents have 15 working days after the end of the reporting month to submit their reports. Some adjustments are made to cover any data missing when direct respondents are late in sending their reports. A similar procedure is followed for the banking statements. This procedure enables the NBB/BNB to respect the six-week time-lag granted by the ECB for the submission of the monthly b.o.p. data.

3.6 COMPILATION FREQUENCY

With regard to publication, the b.o.p. of Belgium is compiled on a monthly basis.

3.7 DATA CONTROLS

Data are checked within the mainframe environment for validation purposes, as well as at the technical level, to verify their content (adequacy, completeness, etc.) and cohesion. These controls consist in checking, inter alia, the accuracy of the identification number and in performing certain cross-checks (transaction, country and currency codes). One of the in-house cohesion controls is aimed at verifying the consistency of each individual report. Corrections are made to the individual data stored in the mainframe. This correction process is closely monitored using the following files: a file for basic data, including all accepted data; a file for correction purposes; and a historical file, which provides information on the different stages through which a record passes.
Individual controls are carried out on a transaction-by-transaction basis. These controls consist in an evaluation of a selection of individual transactions, based on ad hoc criteria for each item, the result of which may be corrections. Some plausibility analysis is also carried out for each b.o.p. component at two levels: by transaction code (time series) and by respondent (on the basis of its profile). Systematic comparisons are made within the Infocentre environment using external information, such as balance sheets (a check for the FDI survey). The foreign trade statistics, which are used in the b.o.p., are compared with the data on goods obtained from the ITRS; this is performed on a quarterly basis for about 1,100 enterprises, representing more than 60% of total import-export transactions).

3.8 REVISION POLICY

Data revision is a continuous process. Individual records can be updated on a daily basis. These updates can be tracked in detail via historical files. Aggregated data for dissemination are currently revised as follows.

Monthly figures are produced within six weeks, in order to fulfil the requirements of the ECB. The revision process is carried out at a monthly, a quarterly and an annual frequency. The revision of a year or a quarter involves the revision of every month concerned.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Y + 15 M</td>
<td></td>
</tr>
</tbody>
</table>

The time periods given for reporting are as from the end of the month, quarter or year concerned.

3.9 PUBLICATION

The current national presentation of the b.o.p. is in principle, in line with the IMF Balance of Payments Manual (5th edition) or BPM5. Publication takes place on a monthly basis (only on the NBB/BNB’s website) and on a quarterly basis including monthly data (hard copy publication).

The titles of publications produced by the NBB/BNB are listed in Sub-section 13.1.

The b.o.p.-figures are available on the NBB/BNB’s website (www.nbb.be).

The main internal users of the b.o.p./i.i.p. data are the Research Department and the Statistical Department; banks, ministries, professional associations, embassies, universities and students are regular external users.

As Belgium participates in the Special Data Dissemination Standards (SDDS) system, the release data for b.o.p./i.i.p. and reserve assets are published in advance.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The monthly b.o.p. data are available within the six-week time period; however, these data have a lower degree of reliability and coverage and are completed using estimates for certain missing respondents.

Monthly b.o.p. statistics (flows) are published in the quarterly bulletin on a transaction basis, together with a limited sectoral breakdown (in accordance with the BPM5).

The level of the reporting provided by banks in the field of both flow and stock data is satisfactory considering the six weeks’ deadline.

Only a technical incident that prevents any data delivery initiates a significant problem in coverage when it affects a major bank. In that case, some adjustment of the statistics may be made if one of both types of data is available.
For direct reporting, the coverage within the six weeks’ deadline may be problematic. For that reason, the missing data are systematically supplied on the basis of the data for the same period of the year before. This procedure is only applied to the selection of direct respondents with regard to which the transmission of data is considered compulsory. The data incorporated in this way are adjusted for outliers, especially in direct investment.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS
From September 2001 onwards, trade statistics are used for the “goods” component of the b.o.p. (for data since 1995). These trade statistics are not taken over as such, but are adjusted, possibly in combination with the information collected via the ITRS, in order to adapt them to BPM5. No estimates are made in the event of missing data. Furthermore, there is no valuation of the imports on a f.o.b. basis. The value remains purely on an invoice basis. No seasonal adjustment is made.

The goods item is revised – as are all items – in accordance with the general revision calendar (see Sub-section 3.8.). B.o.p. data have been almost compliant with BPM5 standards since 1995. Owing to the data sources used at present and the related registration procedures, the b.o.p. general merchandise item is near to the concept of “general trade”, because goods stored in bonded warehouses are registered as imports and vice versa for goods removed from storage in bonded warehouses.

The treatment and geographical breakdown of military goods is the same as that of other transactions on goods.

Transactions under special Community programmes (Satellite, Airbus and others) are reported via the ITRS, thus with the traditional geographical breakdown (counterpart in the transaction).

4.2.2 FOR SERVICES
Financial services are included on the basis of the settlement system plus estimates for commissions and administration fees on collective investment funds (CIIs).

4.2.3 FOR INVESTMENT INCOME
The Belgian data collection system for investment income, which is based on settlements, does not provide the necessary data for the immediate breakdown between intra-euro area and extra-euro area flows. Therefore, the Belgian contribution to euro area investment income is the result of estimating

(i) the amount of Belgium’s global investment income; and
(ii) the split between intra-euro area and extra-euro area income.

With regard to (i), global investment income flows are calculated on the basis of the i.i.p. stocks for the main items of the i.i.p. This outcome is adjusted a posteriori on a yearly basis in accordance with the national accounts. An average return is defined for the major components on a yearly basis, except for the short-term instruments where a quarterly update of the return is applied to the stock data for the previous year; this is then compared with the results of the same process for the stock data of the year before. In order to obtain monthly figures and assess cohesion through time, the annual figure is divided by 12 in accordance with a seasonal profile that is different for dividends of shares and for the other types of investment income. The result is a very rough proxy of accruals. The breakdown by sub-component is available for the main items:

1 Terminology of delivery conditions (e.g. f.o.b, c.i.f.).
direct, portfolio and other investment. Reinvested earnings are estimated and have been included since September 2001 (for data since 1995). Since 2003, reinvested earnings have been estimated at monthly frequency.

With regard to (ii), the split between investment income on euro area assets and non-euro area assets is based on an estimate referring to the available geographical split for MFI stock data and to the last available results of the yearly portfolio investment survey for the non-MFI sector.

The revision process is limited to a first revision which takes place when the i.i.p. for the following year becomes available and to a final update in order to align the b.o.p. income components and the national accounts income components.

4.2.4 FOR DIRECT INVESTMENT
The procedure for estimating reinvested earnings is based on various sources available to the National Bank of Belgium, namely the structural survey and the survey of foreign direct investment, both of which are annual surveys covering a different sample of enterprises. The procedure aims to fix the rate of reinvested earnings to be applied to the total figure for direct investment.

4.2.5 FOR PORTFOLIO INVESTMENT
The figures are based on the settlement data collected via the ITRS. These data are nevertheless adjusted for the banking sector on the basis of its assets/liabilities data, and for the general government sector on the basis of ad hoc statistics related to short and long-term securities.

Until now, interest is not accrued, whether for monthly, quarterly or annual data.

4.2.6 FOR FINANCIAL DERIVATIVES
For financial derivatives and other investment, no specific estimates are made. The available data are taken from the ITRS, in which ad hoc transaction codes are identified in order to isolate those components. No further adjustments are made to ensure that derivatives fulfil the required methodology for options and futures.

4.2.7 FOR OTHER INVESTMENT
See Sub-section 4.2.5 above.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
As a consequence of the way in which income is computed (see Sub-section 4.2.3), no specific bias towards the under-recording of credits is observed. Nevertheless, in the ITRS a phenomenon of under-recording does appear, owing to the lack of a breakdown, at maturity date, between income and capital.

Estimates are produced for the breakdown of portfolio investment income into that on intra-euro area assets and that on extra-euro area assets (see Sub-section 4.2.3).

By virtue of the compilation method, the data are not adjusted further or reconciled in relation to the different frequencies or stages of publication.

The geographical allocation refers initially to the country of settlement, both for the debits and the credits. The same breakdown is available for historical data. The sole exception to this allocation principle relates to the income derived from the banking sector’s assets, where the debtor principle can be applied.

5.1.2 INCOME ON DIRECT INVESTMENT
Reinvested earnings have been included since September 2001 (for data since 1995). The estimate of dividends is based on the calculation of gross dividend yields for the major partner
countries applied to existing stocks of equity capital. Since 2003, reinvested earnings have been estimated at monthly frequency.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
For both equity and bonds/notes, income is calculated on the basis of stock data (see Sub-section 4.2.3). The estimate of dividends is based on the calculation of gross dividend yields for the major partner countries applied to existing stocks of equity capital. For debt instruments, rates by major currencies are used. For money market instruments, in the estimate of the current year data, an adjustment of the reference rates is made each quarter. Taking into account the calculation process, all instruments are treated in the same way, i.e. there is no specific treatment for different kinds of bonds (e.g. zero-coupon bonds or indexed bonds).

The result of the calculation procedure is the production of an overall estimate of portfolio income that can be considered a first proxy of income.

An estimate of the breakdown into income on intra-euro area assets and income on extra-euro area assets is made (see Sub-section 4.2.2).

Income on collective investment institutions (CIIs) is compiled on the basis of the i.i.p., in line with the procedure of other types of income (see Sub-section 4.2.3).

5.1.4 INCOME ON OTHER INVESTMENT
For the loans and deposits components of other investment, income is computed in the same way as for direct investment and portfolio investment, i.e. on the basis of the i.i.p.-related components. These items cover assets and liabilities of both individuals and enterprises. Furthermore, certain income transactions are not registered, such as income on trade credits and the interest share in financial leasing.

Since 1999, the income on reserve assets has been based on data provided by the Accounting Division of the NBB/BNB.

5.2 DEFINITIONS
Definitions are in line with the BPM5, except for the deviations set out in Sub-section 5.3. Since 1999 all financial derivatives have been treated as such, including those on interest rates, so that income on derivatives is no longer included in the income account. Dividends are recorded as of the date they are payable.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
Income on debt between related enterprises is limited to loans and deposits, while income on trade credits is recorded as income on other investment.

A further deviation relates to income on bonds and notes between affiliates, which is recorded as portfolio investment income since the underlying transactions in the financial account cannot be recognised as direct investment transactions.

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
For direct investment earnings, with regard to the registration of reinvested earnings, the possibility of applying the ECB’s recommendations will be investigated because the information needed to isolate the operating profit is not available.

With regard to income on portfolio investment, improvements will be made when the i.i.p. is computed in more detail (basic data will be broken down security-by-security). In that context, a more appropriate estimate of the income would be possible for specific individual instruments, and on a full accruals basis.
5.6 ESTIMATION METHODS

The methods and data sources used to compile quarterly data are identical to those used for monthly data. The quarterly data are produced from a summary of monthly data.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2). No other source of information is used.

6.2 DEFINITION

In principle, the definition of the capital account is in accordance with the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor. The distinction between current and capital transfers is made by using different transaction codes in the collecting system, in line with the BPM5 criteria.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

The component “other capital transfers” is covered only partially and the quality of the available information needs to be permanently checked.

Moreover, the component “debt forgiveness” is poorly covered. An expansion of its coverage is under investigation.

6.5 INTENDED HARMONISATION

For debt forgiveness, potential sources are to be contacted, such as individual banks, government or the Office du Ducroire, a public insurance company which provides payment guarantees for Belgian Exporters.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

At present, direct investment in the b.o.p. is computed on the basis of the information collected via the ITRS, where specific transaction codes are used, thus also providing a breakdown between euro area assets and non-euro area assets. Furthermore, the data from the ITRS are compared with the banking statistics – in order to improve the quality of the data for the banking sector – and with balance sheet data and media information with a view to increasing coverage and quality.

Geographical allocation is based, in principle, on the country of settlement (for mergers and acquisitions, the correct country of the counterpart is identified for major cases). However, in order to identify the split between intra-euro area and extra-euro area transactions, reporting agents are requested to take the residency of the issuers into account and to report the euro area/non-euro area split for equity capital.

A yearly survey is organised on foreign direct investment abroad and in the reporting economy. Here, the debtor/creditor principle is fully applied, with the information being collected for each individual direct investment relationship. In the event of a change of ownership of a resident company from a non-resident to another non-resident direct investor being revealed by the survey, the change is recorded in the FDI stocks, but not in the corresponding b.o.p. flows.

Transactions on equity capital made without any settlement are registered directly by the b.o.p. compilers. The valuation of those transactions is based on official publications, if available (prospectus legally compulsory
when transaction is public), specialised media information and stock exchange data.

B.o.p. figures are adjusted on the basis of the direct investment survey. Any improvement made at the level of coverage of direct investment statistics will cause problems in relation to historical data. Currently no backward adjustments are planned.

As a consequence of the full application of the rule that all transactions between affiliated enterprises should be recorded under direct investment, the transactions effected by the co-ordination centres in Belgium have considerably inflated the data for direct investment.

Direct investment transactions settled through an exchange of shares are recorded at the time when the exchange of shares takes place.

Valuation of transactions settled through an exchange of shares is based on the official estimates of the market price published by the parties involved.

7.2 DEFINITION

In principle, Belgium plans to comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB's Working Group on Balance of Payments and External Reserves Statistics and its predecessor.

The definitions of the different concepts used in direct investment statistics are in line with the BPM5 and the OECD Benchmark (threshold of 10% ownership, direct investor, direct investment enterprise, direct and indirect relationship).

All cross-border transactions in real estate are covered.

Special purpose entities are considered to be ordinary enterprises, regardless of the type of transactions in which they engage.

As a result, even inter-company transactions of financing-oriented special purpose entities are included in direct investment statistics. The transactions with related banks, such as loans and deposits, are excluded from direct investment statistics.

For equity capital, the main information is based on the related settlements. Those data are completed, in some cases, by using information from specialised newspapers or other documentary sources, or by using the direct investment survey results, in order to adjust the equity capital item for transactions carried out without any settlement.

On the basis of an ongoing evaluation of major financial flows registered as shares in portfolio investment, several of these transactions are reclassified as direct investment if they fulfil the ad hoc criteria.

Loans are included regardless of their maturity, and even cash management transactions are covered as far as possible.

Offsetsing entries for reinvested earnings are included.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

The allocation of FDI in the reporting economy is based on a strict assets/liabilities principle and not on the directional one. An adequate method based on the use of a reference register to reallocate the individual transactions is still being analysed.

Adequate methods of implementation are under development. Furthermore, trade credits between related enterprises and in respect of issues of bonds and notes between related enterprises are not included in direct investment, but in other investment and portfolio investment respectively. All transactions between related banks or between related financial institutions, except those relating to equity capital, are recorded as other investment or portfolio investment, rather than
as direct investment. The direct investment survey will make it possible to adjust the trade credits item in the near future, once coverage is sufficient.

7.4 GAPS
None.

7.5 INTENDED HARMONISATION
The survey conducted covers not only direct investment flows and stocks, but also other components (earnings, reinvested earnings and distributed earnings, as well as income on debt and Foreign Affiliated Trade Statistics (FATS)). The survey is also useful for reconciliation purposes. The information obtained from the survey is expected to rectify most of the deviations and fill the gaps mentioned, with the exception of transactions in bonds between affiliates. Corrections on flows are made on the basis of the survey results, except for trade credits and bonds.

7.6 ESTIMATION METHODS
The information content of the quarterly data is similar to that of the monthly data. No specific estimates are made.

8 PORTFOLIO INVESTMENT
8.1 SPECIFIC FEATURES OF DATA COLLECTION
The source for data collection on portfolio transactions is the ITRS (settlement data). The codification used for these transactions is based on a classification by instrument, by country of issuer (Belgium, euro area or non-euro area) and by original maturity (up to one year or more than one year). The euro area/non-euro area split has been produced since mid-1998, but it is not possible to calculate this split for historical data.

The geographical allocation on the liabilities side follows the transactor principle (first counterpart of the settlement) in full. For the assets side, two types of information are available: the first counterpart, as in the case of liabilities, and the issuer in an aggregated way (euro area/non-euro area split).

For the MFI sector, flows are derived from the available stock data where the allocation is made by country of issuer (quarterly) for assets and by country of first holder for liabilities.

For the general government sub-component, data derived from an ad hoc survey on the holdings of securities issued by the central government are used to revise the original information collected via the ITRS.

An ISIN-based collection system is not possible at present (see also Sub-section 8.5).

There is no separate reporting system for the transactions settled through financial centres, custodians, etc.: they have to report within the framework of the ITRS. In Belgium, an important clearing house operates, namely Euroclear bank. A large number of transactions passes through this clearing house. When it acts as a custodian, it intervenes in the transactions as counterpart for both sides of the transaction; this should theoretically result in large flows with other countries and should have a serious impact on the geographical allocation in a number of countries as well. However, in the national presentation of the balance of payments, without the geographical breakdown, those transactions relating to the role of Euroclear as intermediary between non-residents are neutralised.

Finally, trading in loan portfolio (securitisation of loans) is classified under portfolio investment.

8.2 DEFINITION
In principle, Belgium plans to comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor.
For securities, the split between domestic and foreign securities is available, with a further breakdown into euro area/non-euro area assets and liabilities.

The collection system provides a single maturity breakdown; over one year (long-term) and up to one year (short-term). For long-term securities, a distinction is made between equities and bonds; for short-term securities – money market instruments – there is no further breakdown by instrument. Only for domestic issues have separate codes been created for government and other issues.

In principle, income, commissions, charges and fees on portfolio transactions should be recorded separately in the collection system; where this is not the case, however, these items are included in the settlement amount for the portfolio transaction.

As yet no offsetting entries are made for accrued interest.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

In general terms, data for portfolio investment can be considered to be reliable, although there are some areas in which there is still some progress to be made.

Another deviation is the problem encountered when applying the valuation principle to the market value: the recorded value is the payment value. Nevertheless, this should be a good proxy for the market value.

Transactions in bonds between affiliated enterprises are recorded under portfolio investment and not under direct investment (see Sub-section 7.3).

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

The ISIN codes have not been used so far, as the current collection system does not allow ISIN numbers to be included in the reports. Nevertheless, the use of ISIN codes and the integration of these in the actual collection system (in a parallel circuit) will be studied in the near future.

The codification used for portfolio transactions is based on a classification by instrument, by country of issuer (Belgium, euro area or non-euro area) and by original maturity (short-term or long-term).

8.6 ESTIMATION METHODS

Some estimates based on time series analysis are made for missing data and lead to some adjustments, if necessary.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

With regard to financial derivatives, the NBB/BNB has modified the nomenclature and codes for derivatives in order to distinguish between the option type and others (forward, interest and currency swaps, and futures). For the former, a supplementary breakdown has been introduced in order to produce a split between assets and liabilities according to the issuer.

The geographical counterpart is the counterpart in the transaction, because the counterpart is usually the market itself in the case of organised markets.

9.2 DEFINITIONS

The definitions used for the instruments are in line with the BPM5. Nevertheless, no distinction is made by type of margin; all are included in financial derivatives.
9.3 DEVIATIONS FROM AGREED DEFINITIONS

The NBB/BNB complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payment and External Reserves (the former Task Force on Financial Flows and Stocks).

All types of margin are included in financial derivatives.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

None.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Information is based on the assets and liabilities data of the banking sector (to be extended to the MFI non-banks) for the MFI sector, and on the general collection system for the other sectors.

Data for trade credits are covered by a monthly survey, from which a sectoral breakdown can be obtained. The survey provides month-end information on assets and liabilities related to transactions on goods for 1,500 companies.

For the banking sector and the MFI non-bank sector (as from mid-1999) the flow data are derived from stock data (contained in their balance sheet reporting). There is an instrumental split between loans and deposits, and a sectoral breakdown is also available. The geographical breakdown can be provided, as well as a maturity split (based on the initial maturity of up to one year or more than one year). All these breakdowns are available for all periods (monthly, quarterly and annually). These breakdowns can also be supplied for historical data.

The breakdown into extra-euro area and intra-euro area b.o.p. flows is derived from the geographical breakdown available in the balance sheets of the MFIs for both assets and liabilities.

The transactions settled via TARGET are registered by the intervening MFIs in the same way as other cross-border settlements. In the organisation of the reporting procedures, the NBB/BNB, as the operator of TARGET, is considered to be a second intervening MFI. As a result, interbank transactions are registered between the NBB/BNB and the domestic MFI that intervenes for the resident counterpart, using neutral codes.

10.2 DEFINITION

In principle, Belgium plans to comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor.

Repo transactions are included in other investment, where they are recorded as loans. This instrument, which is used by the banking sector, is very important; it accounts for more than 60% of transactions in Belgian government issues and around 30-40% of operations settled by Euroclear. Most of these transactions are genuine repos, although sale and buy-back transactions also occur. By contrast, bond lending is not very well-developed. Trading in loan portfolios does take place, but is not yet very significant; it is treated as portfolio transactions.

Variations on short-term claims and liabilities between affiliated companies are classified under the direct investment component.
Transactions in banknotes and coins are registered in this b.o.p. only when they involve a movement on a banking account.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

Trade credits between affiliated enterprises are currently recorded under the other investment and not under the direct investment item (see Sub-section 7.3).

Loans and deposits between affiliated MFIs or between affiliated other financial institutions as well as loans and deposits between MFIs and related enterprises are recorded under other investment.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

The direct investment survey will be used to record trade credits between affiliated enterprises under direct investment.

10.6 ESTIMATION METHODS

Some estimates based on time series analysis are made for missing data and may lead to some adjustments, if necessary.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Sub-section 3.2).

11.2 DEFINITION

The information is obtained from the Accounting Department, where no problems relating to confidentiality are encountered in providing breakdowns.

Financial derivatives are recorded on a net basis. Embedded financial derivatives are recorded together with the underlying financial instruments and are not recorded and valued separately.

All transactions in reserve assets are registered at market price and converted into euro using the market exchange rates at the time of the transaction.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

No significant deviations.

11.4 GAPS

Data availability does not pose a problem. The instrumental breakdown is not currently available.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The production of an i.i.p. within nine months implies that many data are of a very provisional nature. As long as items are produced by the accumulation of flows, the time available is not an obstacle. Nevertheless, with a view to including the results of stock data from ad hoc surveys, the period of nine months is too short, considering that it takes almost this long to collect the data; for direct investment stocks, for instance, a minimum of 12 months is needed to produce a first set of reliable data.

At present the following sources are used to compile the i.i.p. data:

(i) stocks:
   – banking sector: portfolio investment (equities, long-term debt instruments and money market instruments) and
other investment (short-term and long-term loans and deposits);
– general government: portfolio investment (government bonds) and other investment;
– monetary authorities (reserve assets and other assets);

(ii) flows:
– banking sector: direct investment;
– other sectors: all items.

The coverage is currently slightly different for general government, where the stock data which are used for other investment are not fully in line with the similar flow data used in the b.o.p. The concepts are identical in both the i.i.p. and the b.o.p. financial account. As a result, the same weaknesses and gaps can be identified.

Although the IMF Co-ordinated Portfolio Investment Survey is operational in Belgium, the data provided are not yet used in the i.i.p. Considering the fact that the survey is repeated each year in Belgium, the data will be incorporated in the i.i.p., at the latest in 2004. Nevertheless, as the response time is in theory set at six months, the results of the survey will only be used in a revised version of the corresponding i.i.p.

The breakdowns by sector and by instrument are based on the data sources. With the exception of the banking sector’s assets, no euro area/non-euro area breakdown is possible for stock data unless the survey results are used. Moreover, even if the survey results were used, these would cover only the assets side.

Price changes are applied to equity capital and shares, using specific stock exchange indexes for the main currencies. A reference to the country is not possible owing to the lack of reliable information at present. Different procedures are applied to quoted and unquoted shares. For real estate investment, a price adjustment is made by reference to a domestic index of real estate prices.

Exchange rate changes are calculated on the basis of the data available on foreign currencies. The conversion is calculated using the end-of-year rate by currency, so that the stocks for the previous year are estimated at current rates. The transactions are computed using the monthly average rate for the month of registration. The valuation is based on:

– the book value: banking sector (portfolio investment, where – for the trading portfolio – the book value is mostly based on the marked-to-market value of liquid assets, and other investment);
– the nominal value: general government (portfolio investment); and
– a proxy of the market value: other sectors (portfolio investment).

For the banking sector, equities are adjusted to a proxy of the market value in a similar way to the other sectors by applying a stock market index evaluation rate. For all other items, the valuation is applied to the registered accumulated flows.

There are no plans at present to produce quarterly data.

The results of the yearly FDI survey are not included in the i.i.p. Nevertheless, they may be used to make some adjustments. Further, the information included in the survey should make it possible in the near future to compile a first proxy of the reinvested earnings component.

A fully updated methodology and processing is under development, to become fully operational in due course.

12.2 DEFINITIONS

12.2.1 GENERAL
The definitions for the i.i.p. items refer to the BPM5, as do the definitions for the respective b.o.p. items.
The reconciliation process is based either on stocks or on the accumulation of flows, depending on the item concerned.

12.2.2 DIRECT INVESTMENT
For the b.o.p., the directional principle is not applied. Reinvested earnings are estimated on a yearly basis (at Y + 1). At present, no estimation is made for the current year.

12.2.3 PORTFOLIO INVESTMENT
For discounted instruments the discounted value is usually taken into account, so that the difference in relation to the purchase price is included in the i.i.p.

12.2.4 FINANCIAL DERIVATIVES
There is no recording of financial derivatives on a gross basis. Financial derivatives are computed on the basis of accumulated flows; therefore, no valuation of market prices is carried out for the resulting stocks.

12.2.5 OTHER INVESTMENT
See Sub-section 12.2.1.

12.2.6 RESERVE ASSETS
Stocks of reserve assets are compiled in cooperation with the Accounting Division of the NBB/BNB.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
See the b.o.p. financial account.

12.4 GAPS
See the b.o.p. financial account.

12.5 INTENDED HARMONISATION
See the b.o.p. financial account.

12.6 ESTIMATION METHODS
None.

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Following the division of the former Czechoslovakia into the Czech and Slovak Republics on 1 January 1993, Česká národní banka, the Czech National Bank (CNB), continued in its responsibility – as the central bank of the Czech Republic – for compiling balance of payments (b.o.p.) and international investment position (i.i.p.) statistics. The Balance of Payments Division of the CNB’s Monetary and Statistics Department collects data from a variety of sources, including foreign trade statistics, the banking sector, the Czech Statistical Office, government ministries (Ministry of Finance), government agencies (e.g. the National Property Fund), securities traders/brokers and a large number of corporate sector units, including specialised units (services, etc.).

The b.o.p. and the i.i.p. are compiled quarterly and are published on the CNB website, in printed publications and also annually in the yearbooks of the Czech Statistical Office (CZSO). The data are compiled in Czech koruna (CZK) but are also published in euro (EUR) and US dollars (USD). The collection and compilation methods are being adjusted to comply with the recommendations of the 5th edition of the IMF Balance of Payments Manual (BPM5).

Since January 2003, the CNB has also published monthly estimates (i.e. key items in accordance with ECB requirements). These figures are based on monthly figures from the banking sector and the CZSO, as well as on current information from non-monetary financial institutions and estimates.

When compiling and publishing the b.o.p., i.i.p. and reserve assets, the CNB acts independently from the general government.

2.2 LEGISLATIVE PROVISIONS

Under Act No 6/1993 Coll.¹ on the Czech National Bank, as last revised by Act No 127/2002 Coll. (complete wording No 335/2002 Coll.), all banks – including branches of foreign banks and other entities holding information necessary for the compilation of the b.o.p. – are obliged to report this information to the CNB (Article 41). The CNB defines the population of entities covered by this obligation as well as the content, form, dates and manner of submitting the information and documents required from them. Pursuant to Article 46, non-compliance with the rules laid down in the Act can result in a fine of up to CZK 1 million.

Article 5 of Act No 219/1995 Coll., the Foreign Exchange Act, lays down the reporting obligations for residents regarding financial claims and liabilities vis-à-vis non-residents and residents abroad, foreign direct investment (FDI) and other investment, financial credits, securities and associated collections, payments and transfers vis-à-vis non-residents and residents abroad, financial market operations, including operations performed through non-residents, and the establishment of and balances on their accounts abroad. The terms and manner of the reporting obligation are stipulated by Decree of the CNB, or when required by a foreign exchange authority.² A threshold of CZK 1 million has been set for the reporting obligation (since 1 January 2004).

2.3 INTERNAL ORGANISATION

A new organisational structure of the CNB came into effect on 1 January 2002. The head office, which is managed by the CNB Governor, consists of seven groups, which are divided into departments and divisions.

– The Monetary and Statistics Department was restructured into four monetary and three statistics divisions in March 2004. In

¹ Collection of Laws.
² These authorities are the Ministry of Finance and the CNB.
the area of statistics, it is responsible for methodological management, the collection of and accurate and comprehensive processing of monetary and banking statistics, statistical data on economic development, b.o.p. compilation and administration, and for the development of statistical data systems.

- The Money and Banking Statistics Division is responsible for the concept, methodology and processing of money and banking statistics statements submitted by commercial banks and other monetary institutions. This Division provides banking statistical information to the Monetary Department, the Banking Supervision Department and other users in the CNB and to the general public.

- The Balance of Payments (BoP) Division is responsible for the concept, methodology and compilation of b.o.p. statistics, foreign direct investment (FDI) and portfolio investment statistics and the i.i.p. It is also responsible for providing data to international institutions and for coordinating the IMF’s Special Data Dissemination Standard (SDDS) system. In order to compile the b.o.p. and i.i.p., statistical information from the banking sector, corporate sector and government institutions is used.

- The Statistical Data Processing Division is responsible for collecting and processing statistical data for CNB purposes. It also manages the development of the banking information system, including the meta-information system.

The BoP Division is responsible for the b.o.p., FDI, the i.i.p., external debt and related statistical data compilation. Data collection, control and processing are carried out in close cooperation with the other divisions in the department. BoP Division staff (around 20 in number) are responsible for data collection, compilation, analyses and publications and for providing data to international institutions and domestic users.

Economic analyses of b.o.p. data are also compiled by monetary divisions of the Monetary and Statistics Department.

### 2.4 EXTERNAL COOPERATION

The Czech Statistical Office (CZSO) is the most important external partner of the BoP Division, both as a provider and as a user of the data. The monthly foreign trade statistics, based on data provided by the CZSO, are a keystone for compilation of the b.o.p. goods item. The CZSO also provides some other complementary data for the b.o.p. and, reciprocally, CNB data are used by the CZSO for the compilation of the national accounts.

The CNB uses its own information on government assets and liabilities and also obtains information from other governmental institutions, in particular from the Czech Statistical Office, the National Property Fund (non-resident investment in the Czech Republic) and the Securities Centre of the Czech Republic (ownership of securities by non-residents).

Outside the Czech Republic, the BoP Division maintains contacts with several central banks (e.g. Austria and Germany), mostly to consult on methodological, collection and compilation issues.

The BoP Division takes part in several b.o.p. working groups and has close contacts with EUROSTAT, the ECB and the Organisation for Economic Co-operation and Development (OECD). The International Monetary Fund (IMF) is also consulted regarding BPM5 and the SDDS.

### 2.5 USERS

B.o.p. data are published for the general public on a monthly and quarterly basis by issuing a press release. The data are also disseminated on
the CNB’s website. For all interested parties, the data are published in the following special publications: the quarterly “Inflation report”, the annual “Balance of Payments Report”, the “CNB Annual Report” and the “Statistical Yearbook of the Czech Republic” (see section 3.7). The data are used and analysed in the monetary divisions, in particular.

Externally, all interested institutions in the Czech Republic are able to receive CNB publications.

As for international institutions, b.o.p., i.i.p. and FDI data are dispatched to:

– the IMF, to be published in the “International Financial Statistics”, in the SDDS system, the external reserves database, the “BoP Yearbook”, etc.
– EUROSTAT, to be published according to Vade-Mecum requirements;
– the OECD;
– other institutions and research institutes on request or via the internet.

3 STATISTICAL SYSTEMS

3.1 TYPE OF COLLECTION SYSTEM

B.o.p. compilation is based on a mixed system, i.e. a combination of settlements and surveys. The greatest proportion comprises settlements by the banking sector that can be considered semi-open, based on transactions between residents and non-residents, and does not include a full explanation of the changes in the level of external positions of either the banking sector or the non-banking sector. The settlements are complemented with surveys from government, banks and the corporate sector. Only some reports include the recording of all credit and debit transactions and a country and currency breakdown. In some cases, flows are derived from stock statistics and vice versa.

This reporting system is furthermore complemented by other statistics provided by the CZSO (the trade balance and other information necessary for the compilation of the current account), the MoF, other ministries and by direct reporting institutions. Other sources are also used, e.g. newspapers and official information (FDI and portfolio investment). On the basis of this information, internal databases are also kept.

3.2 REPORTING AGENTS

(i) The monetary authority sector: the CNB provides data on reserve assets, liabilities and other transactions of monetary authorities (stock and flow data).

(ii) The banking sector fully coincides with the ESCB definition of Monetary Financial Institutions – the sectoral breakdown of the ESA 95 is applied. Banks are required to report external transactions on behalf of residents and non-residents and on their own account (stock and flow data). The CNB is the sole agent in the Czech Republic that collects data from the banking sector. It is also authorised to request more detailed information or an explanation if the information submitted by a bank does not comply with the required methodology. For the purposes of b.o.p. compilation, the banks submit statements on their foreign currency and CZK positions, surveys of foreign currency payments and collections, securities statistics, etc.

(iii) The general government sector: data are provided on assets (including subscriptions to international non-monetary organisations) and liabilities.

(iv) The corporate sector – direct reporting institutions: data on assets and liabilities of enterprises and transactions resulting from the export and import of goods, data on FDI abroad and in the Czech Republic, data on stocks and transactions in securities realised between residents and non-residents.

The response rates to surveys are 100% in the banking and government sector and approximately 85% in the corporate sector.

### 3.3 Thresholds

For transactions in euro made by banks and other institutions to EU countries and countries belonging to the European Economic Area, a threshold of €12,500 has been fixed.

### 3.4 Availability of Data

B.o.p. – the data are compiled quarterly within 65 days of the end of the quarter for the first three quarters, and within 70 days of the end of the quarter for the fourth quarter. Since January 2003, monthly estimates (i.e. key items in accordance with the ECB requirements) are published within 45 days (30 working days) after the end of the reference month.

I.i.p. – data are compiled quarterly and are published within one quarter of the end of the reference quarter. External reserves are compiled monthly and are published approximately one week after the reference month.

Only some categories of the b.o.p. and i.i.p. (e.g. FDI) have breakdowns by sector and by country.

### 3.5 Data Controls

A validation procedure is incorporated into the electronic data collection system – the report is not accepted unless it is both valid and consistent.

For other types of collection, checks for completeness and plausibility are carried out by the BoP Division. Unusual fluctuations in the data reported are monitored and the reporting agents are asked for an explanation.
Checks at the aggregate level are aimed at ensuring data quality and consistency with other statistics and time series. Any discrepancies are analysed and the source of the data is thoroughly checked again to uncover possible errors at a lower level of aggregation.

3.6 REVISION POLICY

B.o.p. and i.i.p. data are revised and corrected every time new information becomes available. The revisions are usually made on an ongoing basis and are published in the subsequent quarterly and yearly issues. Most of the revisions and corrections to the b.o.p. result from trade balance and FDI data – when these data are final, all b.o.p. data can also be considered final. Monthly estimates are revised on a quarterly basis according to the results of quarterly surveys.

3.7 DISSEMINATION

The CNB publishes monthly data on external reserve assets and key b.o.p. items, and quarterly data on the b.o.p. and i.i.p.

B.o.p. and i.i.p. data appear in the following regular publications:
- the “Inflation Report” – available in Czech and English, free of charge;
- the “Balance of Payments Report” – in Czech, by subscription, free of charge;
- the “CNB Annual Report” – in Czech and English, free of charge; and
- the “Statistical Yearbook of the Czech Republic” – in Czech and English, for a fee (published by the CZSO – Information Service Division).

All the data on the b.o.p., i.i.p. and external reserves, including time series, are posted on the CNB’s website: http://www.cnb.cz/en/stat_pb.php.

As a SDDS subscriber, the Czech Republic disseminates metadata on the IMF’s Data Dissemination Bulletin Board with a direct hyperlink to the real data in the national statistics (internet address: http://dsbb.imf.org/Applications/web/sddscountrycategorylist/?strcode=CZE).

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

Since accession to the EU on 1 May 2004, a new system for the registration of trade with EU Member States (Intrastat) has been in force. The special Intrastat forms completed by exporters and importers are checked by customs offices in the course of primary processing, with their subsequently forwarding the data to the Czech Statistical Office for final processing.

Trade with third countries is still recorded via the common system based on customs statistics data. The relevant document is the Single Administrative Document (SAD) completed by exporters (importers). The processing is the same – primary data from customs documents are processed by the General Directorate of Customs and the CZSO undertakes the final processing.

The CZSO publishes monthly data on exports and imports 37 days after the end of the month under review, which is also when the CNB receives the data. The definitive data for the year under review are usually published by the CZSO around August of the following year. In previous years, the trade data on imports in the b.o.p. deviated from those officially reported by the CZSO, owing to the application of market prices to imports of natural gas.

4.2 DEFINITION

Goods in the Intrastat and customs statistics are monitored in a way that allows them to be broken down into:
- general merchandise (including goods procured in ports by carriers);
- goods for processing and repairs of goods; and
- non-monetary gold.

</tbody>
</table>
Data on the export and import of goods (in accordance with the BPM5) cover the following:
- any change of ownership;
- the market value of goods;
- mostly f.o.b. prices; and
- a geographical breakdown.

### 4.3 DEVIATIONS FROM AGREED DEFINITIONS

The b.o.p. of the Czech Republic deviates from the BPM5 in that it is not able to report separately on goods procured in ports by carriers.

### 4.4 GAPS

Goods procured in ports by carriers are included under general goods and are not monitored separately in the customs statistics; from the point of view of the Czech Republic’s trade, however, the volumes in this item are insignificant.

### 4.5 INTENDED HARMONISATION

None.
4.6 ESTIMATION METHODS

None

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

(i) Transportation
The data are taken from the banking foreign exchange statistics (the Monthly Statement of Foreign Exchange and CZK Collections and Payments, which records collections and payments effected to and from abroad through domestic banks in foreign currencies and in CZK as well as payments effected between residents and non-residents in foreign currencies in the Czech Republic) and directly from major carriers and pipeline operators. They are supplemented by an estimate in the area of the transportation of goods on export.

(ii) Travel
Credits and debits are measured by means of the instruments used to make travel-related payments. The data are taken from the banking foreign exchange statistics (bureau de change operations, settlements of entities operating in the travel area, settlements of payment cards) and are supplemented with information from non-bank bureaux de change and issuers of payment cards. When determining the travel item, we assume that all transactions by bureaux de change and executed using payment cards are related exclusively to travel. The travel item is supplemented by estimates of personal expenditure on goods and services by seasonal, border and other workers employed in the host country.

(iii) Other services
The data are taken from the banking foreign exchange statistics. Services are recorded in the b.o.p. at the time when payment for the services provided is credited or payment for the services received is made (no potential receivables and payables from services are assumed). Enterprise surveys are the data source for the compilation of insurance and reinsurance items.

5.2 DEFINITION

Payment items (transaction codes) are assigned to the collections and payments effected to and from abroad through domestic banks; these items are set in such a way as to cover all types of services according to the BPM5 (including financial services) and to correspond with it as regards content.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

Where transport costs form part of the price of imported goods (the c.i.f. value of imports), these costs are reported in the b.o.p. under the import item within the balance of trade.

5.4 GAPS

The difference between the transaction codes used in domestic and foreign payment systems complicates the recording of payments in CZK effected between residents and non-residents in the Czech Republic. Transactions effected through residents’ accounts at foreign banks are not recorded. In the case of travel, only the credits and debits which can be registered statistically are recorded.

5.5 INTENDED HARMONISATION

It is envisaged that for the collection of data on the compilation of transport services connected with the export and import of goods, the conclusions and recommendations of the Eurostat Balance of Payments Working Party will be used.

5.6 ESTIMATION METHODS

The costs connected with the transportation of goods on export (including insurance, storage,
etc.), which form part of the export price, are estimated using surveys carried out among selected exporters. The share of these costs in overall exports is estimated on the basis of the final data of previous years. The threshold fixed in respect of payments in euro will require additional estimates for all services items.

No estimates are carried out for foreign travel and other services (excluding insurance).

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES
The source of the compensation of employees item is data compiled by the CZSO; it comprises wages and salaries earned by individuals for work performed in the host country. Contributions paid by employers to social security scheme, etc. are included.

Credits from the work of Czech citizens abroad are estimated using information on the number of Czech citizens who work abroad in the short term and their average income.

To determine labour costs of foreigners in the Czech Republic, administrative data on the number of foreigners employed are used (work permits issued, registered foreigners for whom no work permit is required); these are supplemented with an estimate of the number of foreigners employed illegally and with information on the average wage.

6.1.2 INCOME ON DIRECT INVESTMENT
Income on direct investment is recorded in the b.o.p., broken down into income on equity and income on debt (interest on credits between direct investors and direct investment enterprises).

As regards income on equity, the banking foreign exchange statistics recording the transfer of shares of earnings of direct investment enterprises (dividends, etc.) are used for the preliminary version of the b.o.p. Reinvested earnings and income on debt are estimated according to their level in the preceding period and are also recorded as an offsetting entry in the financial account.

Income on direct investment (dividends, reinvested earnings and interest) for the revised version of the b.o.p. is taken from a statistical survey carried out once a year of companies with ownership holdings abroad and companies owned completely or partly by non-residents. All components of income on direct investment are available with a breakdown by country and economic sector.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
Income on portfolio investment is recorded in the b.o.p., broken down into income on equity and income on debt securities (bonds, banknotes and money market instruments).

In the case of income on equity, the banking foreign exchange statistics recording real transfers of dividends are used. The data obtained in this way are compared with the statements compiled by securities traders. A breakdown by basic sector (central bank, government, commercial banks and other sectors) is available.

On the credit side, income on debt securities is partly obtained from the reports of securities traders (government and other sectors) and partly estimated (banks). On the debit side, in the case of domestic securities denominated in CZK, this is obtained from statements compiled by securities traders, and in the case of domestic securities denominated in foreign currencies it is calculated according to the interest rate and maturity of the interest (broken down by currency and sector).

The income on debt securities taken from the brokers’ statements consists partly of real transfers of interest and partly of calculated interest (on an accruals basis).
In the case of the data obtained via the statements of securities traders, a breakdown by the sector of the domestic issuer and by the country of the registered office of the non-resident is available. Income on investment funds is included.

6.1.4 INCOME ON OTHER INVESTMENT
Interest on central bank assets (reserves) and liabilities is taken from the accounting records, where it is recorded on an accruals basis.

Information on interest on government loans granted and received is taken from the foreign exchange statistics and reflects real transfers of funds.

Interest on deposits and loans of commercial banks is estimated. In the b.o.p., it is recorded on an accruals basis, with the assumption that interest will be paid at maturity.

In the case of other sectors, interest on trade credits and loans is estimated.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
In the case of wages and salaries it is not possible to differentiate consistently between income resulting from a short-term stay in a host country and income connected with a long-term stay (potential transfers of which are to be recorded under current transfers according to the BPM5). The accruals principle is not fully applied for interest.

6.3 GAPS
Insufficient coverage of the household sector.

6.4 INTENDED HARMONISATION
Interest on swaps has until now been recorded under income on investment; the manner of reporting will be adjusted to ECB requirements.

The accruals principle will be used for all items of the income balance where it is possible to create the prerequisites for it.

6.5 ESTIMATION METHODS
Interest on loans received by other sectors from abroad is estimated on the basis of the average level of the loans and credits received and granted in the reporting period and the average interest rates.

The estimate of interest on deposits and credits of commercial banks is based on the average level of the deposits and credits granted (or received) in the reporting period and the average interest rates (broken down by maturity of the deposits and credits).

When estimating interest on trade credits, information gathered from selected exporters (importers) of machinery is used.

7 CURRENT TRANSFERS
See Sub-section 8 on the capital account.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION
The data for current transfers and the capital account are taken from the banking foreign exchange statistics. Transfers to and from EU institutions that are linked to development aid and social policy will be recorded under current transfers. Transfers linked to structural measures and agricultural policy will be recorded partly under current transfers and partly under capital transfers.

Transfers are broken down into government (public) and private domains according to the institutional sector of the resident. All technical assistance from the European Union (provided under the Phare Programme) has been included in government transfers.
8.2 DEFINITION

The capital transfers item includes transfers of funds connected with the migration of the population and transfers (purchases and sales) of non-produced, non-financial assets (licences, etc.). In accordance with the BPM5, any acquisitions and disposals of land by representative offices of foreign governments are recorded under capital transfers.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

The banking foreign exchange statistics do not allow consistent differentiation between current and capital transfers – for example, gifts and grants of a capital nature are included in current transfers together with other gifts.

8.4 GAPS

Non-financial transfers such as transfers of migrants’ movable assets and gifts and grants in kind (an offsetting entry to goods) are not recorded.

8.5 INTENDED HARMONISATION

Any debt forgiveness (by contractual agreement) will be recorded under the capital transfers item.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Information on direct investment is obtained primarily from the reports submitted by non-banks pursuant to the reporting obligation ensuing from the Foreign Exchange Act. The reports on FDI are effected through one branch of the Czech National Bank upon each transaction. These data are further revised on the basis of annual direct investment reports from non-banks.

Supplementary sources of information are:
- statements from banks;
- National Property Fund reports on foreign payments;
- the Czech Consolidation Agency;
- the courts and the Companies Register;
- information from the stock exchange;
- the commercial bulletin; and
- information from the press.

Information on inter-company loans and trade credits is obtained from the reports submitted by non-banks under the reporting obligation.

Preliminary data on direct investment flows are published monthly, and stock data derived from flows are published quarterly. The monthly flows of direct investment are available within 45 days (30 working days) after the end of the reference month, and the quarterly stocks and positions in the b.o.p. are available within 65 and 70 days respectively after the end of reference quarter. The data are revised with a 15-month delay on the basis of annual reports on the stocks of assets and liabilities of companies. The data are published on the CNB’s website.

Direct investments are reported broken down as follows:
(i) by instrument into equity capital, other capital and reinvested earnings;
(ii) by territory and by sector; and
(iii) by foreign direct investment in the Czech Republic and Czech direct investment abroad.

9.2 DEFINITION

The definition of foreign direct investment is in line with the recommendations of the IMF (BPM5) and with the directives of both Eurostat and the OECD. This means that the following points are observed:
- 10% ownership criterion;
- directional principle for FDI;
- the data include inter-company financial debt transactions (borrowings and loans and trade credits and debt securities);
– special-purpose entities are not monitored separately;
– reinvested earnings form part of FDI.

When recording direct investment transactions, the actual operation concept is applied.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Estimates are carried out only in the case of reinvested earnings – quarterly, with a view to one year. These are based on the data on reinvested earnings in individual sectors and in a territorial breakdown for the last period. The data are revised on the basis of surveys of annual statements after the closing of the annual accounts.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection system on cross-border transactions with traded securities has been modified continuously in order to enhance the quality of the statistics on portfolio investment. The primary source of information comprises statements from banks, supplemented by surveys both from non-bank custodians and brokers, and from other financial institutions such as insurance companies, pension funds or investment companies. The changes effective from January 2004 include, in particular, a higher reporting frequency. The data on portfolio investment are in principle collected on an aggregated basis.

Banks and non-bank custodians submit monthly reports on (i) transactions with domestic securities carried out on behalf of their non-resident clients, broken down by sector of the issuer and by country of the holder, and (ii) transactions with foreign securities carried out on behalf of their resident clients, broken down by sector of the holder and by country of the issuer. Brokers and financial institutions (e.g. insurance companies, pension funds and investment companies) report transactions with securities issued abroad that they have carried out on their own account on a monthly basis. These data are supplemented with quarterly information on the geographical allocation of the stocks of foreign securities. The classification by type of instrument (equity securities, long-term debt securities and short-term debt securities) is always applied.

Resident investors who buy foreign securities either directly or by using the services of non-resident brokers or custodians are obliged (effective from March 2003) to submit quarterly statements with the necessary information to the CNB.

In addition, the Securities Centre provides the BoP Division with a monthly list of all securities issued in the Czech Republic and held by non-residents (based on the ISIN codes).

The CNB obtains data on foreign securities transactions from the banks’ monthly statements on payments and collections, in which the operations executed on the bank’s own account and the operations executed on the account of clients, broken down by sector, are
recorded separately. The data on purchases and sales are reported at the purchasing and selling prices realised. Operations effected in foreign currencies are converted, using the average exchange rate for the reporting period.

10.2 DEFINITION

The CNB defines portfolio investment in line with the BPM5. Portfolio investment includes equity securities (shares, participation certificates, interim certificates) and debt securities (bonds, bills of exchange, money market instruments), except for those included under direct investment or reserve assets. Neither financial derivatives nor repo operations (transactions in repurchase agreements) are included in portfolio investment. Service charges and brokerage fees are recorded as services. The breakdown of portfolio investment by country is based, in the case of assets, on the principle of the country of the registered office of the issuer (debtor) and, in the case of liabilities, on the country of the registered office of the owner (creditor) of the domestic security.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

10.4 GAPS

Certain problems in data collection may occur if residents’ assets are administered directly by a foreign securities trader (non-resident custodian).

10.5 INTENDED HARMONISATION

The development of the current data collection system will be heading towards reporting on a security-by-security basis, i.e. on the basis of individual securities using the ISIN or similar codes.

10.6 ESTIMATION METHODS

None.

II FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The CNB began to report data on financial derivatives’ transactions on a net basis as a separate financial account item at quarterly intervals from 2000. These data are derived from the differences in the stocks of financial derivatives in banks’ positions between the beginning and the end of the period under review. Breakdowns of these transactions by sector and by country are not yet available.

Financial derivatives are recorded off the balance sheet in nominal values and in real values in the balance sheets of domestic banks. Real values, either positive or negative, are monitored in the case of forward operations broken down by interest, currency, share, commodity and credit instrument. Positive or negative real values are also monitored in the case of options, the breakdown of which is identical to that used for forward operations; options are broken down further into receivables from the margins on stock exchange derivatives.

For the time being, these values are projected into the financial derivatives’ transactions for positive real value and negative real value as a whole.

11.2 DEFINITIONS

The CNB defines financial derivatives in line with the BPM5, i.e. it records transactions relating to options, futures, swaps, forward foreign exchange contracts and credit derivatives in the b.o.p. Accounting for these operations within the banking sector is fully harmonised with the IAS 32 and IAS 39. The identification of residents is fully in keeping with the ESA 95 methodology.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.
11.4 GAPS

The system of data collection used until now does not cover transactions in financial derivatives that residents execute with entities other than domestic banks. The present system of accounting for transactions in financial derivatives in the corporate sector does not fully comply with the required accounting standards.

11.5 INTENDED HARMONISATION

It is planned to break down financial derivatives’ transactions by instrument. The MoF is preparing a new methodology for calculating and accounting for transactions in financial derivatives in the corporate sector.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Other investment is broken down into assets and liabilities, into long-term and short-term investment, and by basic sector into central bank, government, commercial banks and other sectors. A breakdown by instrument (trade credits, foreign currency and other cash, deposits, loans, other assets and liabilities) is available. Data allowing for a breakdown by territory and currency are reported only for the government sector.

Data sources:

(i) Central bank – statement on foreign exchange and CZK assets and liabilities; information from relevant units within the CNB on draw-downs and repayments of credits received.

(ii) Commercial banks – statement on foreign exchange and CZK assets and liabilities; monthly statement on foreign exchange and CZK collections and payments (draw-downs and repayments of long-term credits received).

(iii) Government – monthly specification of government credits; survey of receivables and payables taken over by the Czech MoF; information from the MoF on capital subscriptions to international non-monetary organisations.

(iv) Other sectors – quarterly statement on the foreign assets and liabilities of companies (buyer and supplier credits, financial leasing, movements on accounts abroad); information taken from the reports submitted under the reporting obligation pursuant to the Foreign Exchange Act (collections and payments relating to financial credits).

The b.o.p. includes records of flows for long-term central bank liabilities, for government and corporate sector assets and liabilities, and for long-term credits received by commercial banks. In the case of short-term central bank liabilities and assets and liabilities of commercial banks (except for long-term credits), the flows are derived from the changes between the opening and closing stocks (from the statement on foreign exchange and CZK positions).

12.2 DEFINITION

The other investment item is basically in line with the BPM5. Both repo operations and trade credits are included.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

During the revision of the b.o.p. in March 2001, credits (loans and supplier credits) between direct investors and direct investment enterprises were transferred from other investment to direct investment (other capital) for the years 1998 to 2000.
12.4 GAPS

The statement from which the data on credits linked with exports and imports of goods are drawn covers a select circle of respondents only (450–500 enterprises). Data are not collected from the household sector, which means that information on changes in technical life insurance reserves is not available. Transactions implemented through private accounts abroad are not adequately recorded.

12.5 INTENDED HARMONISATION

Within the framework of cooperation with the CZSO, available information will be acquired for the household sector.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The sole source for compiling CNB reserve asset transactions is the monthly data of the CNB Accounting Division. The analytical accounts comprise all breakdowns – by instrument, maturity, country and currency.

13.2 DEFINITION

The definition of reserve assets is fully in line with the BPM5 and the Operational Guidelines of the IMF Data Template on International Reserves and Foreign Currency Liquidity within SDDS. All of these assets are under the effective control of the CNB. The accounts of central government are not included in the reserve assets position.

The reserve assets refer to the CNB’s highly liquid, market-valued claims on non-residents denominated in convertible foreign currencies (deposits, securities, cash). Claims on residents and domestic currency deposits are not included in the CNB’s reserve assets.

In addition to foreign exchange, the financial instruments in the reserve assets include gold, special drawing rights (SDRs) and the reserve position in the IMF.

The reserve assets are compiled in accordance with the gross concept, i.e. there is no netting with CNB assets and liabilities.

Data on asset yields are included on an accruals basis.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The i.i.p. includes the stocks of financial assets and liabilities vis-à-vis non-residents corresponding to all financial account items. Stocks on the assets and liabilities sides of the position are recorded separately. The i.i.p. is compiled and disseminated with quarterly periodicity. The already published quarterly and annual data are updated at the end of the year (within 15 months of the end of the reporting period) on the basis of the processing of definitive data on the i.i.p.

14.1.2 DIRECT INVESTMENT

The stocks of active and passive direct investments are compiled and disseminated
quarterly. Direct investment data are broken down by instrument, sector of the economy and country of origin or of the recipient. A breakdown by currency is not available.

The data sources for the quarterly and annual data are different. In the case of the quarterly data, the direct investment stocks are derived using the accumulated flows method. The basis for this is the data reported under the reporting obligation for companies, the banking statistics and the periodical reports of the National Property Fund. The quarterly data on direct investment stocks are published within three months of the end of the reporting period.

The data source used for the compilation of the i.i.p. at the end of the reporting year, and for the verification of the quarterly data, is the reports on the stocks of assets and liabilities of companies submitted at the end of the year, which are included in the direct investment database established and administered by the CNB. The direct investment database is updated on an ongoing basis through the addition of verified information obtained from the data subject to a reporting obligation, banking statistics data, commercial registers, stock exchange data, etc. Together with data on the extent and nature of the direct investment, these reports contain data on economic activity (for example, exports and imports of goods and services, the number of employees). The data on annual direct investment stocks are available within 15 months of the end of the reporting period.

The methodological deviations between the quarterly and annual stocks compiled on the basis of surveys consist in the valuation method employed. For the quarterly stocks, the valuation is based on a summation of the market-valued transactions in the relevant period. In the case of the annual data obtained from company surveys, the basis is the valuation in book values – the own funds book value.

The material definition of the stocks of individual direct investment items is in line with the definition of the corresponding individual categories of direct investment transactions within the financial account.

The calculation of preliminary positions is based on flow data (perpetual inventory method), with adjustments for exchange rate changes. The source of the most comprehensive annual data is the yearly enterprise survey. When data from the yearly enterprise survey are available, the difference between the preliminary and the final positions is attributed equally to the four quarters, and the quarterly data are then adjusted by these amounts.

14.1.3 PORTFOLIO INVESTMENT

The data on portfolio investment stocks are compiled and disseminated quarterly.

Portfolio investment is broken down by instrument, sector, country and maturity. A breakdown by currency is not yet available.

The basic data source is data acquired quarterly directly from securities traders and major investors in the form of statements. The data are based on real stocks. Another source is data on short-term bond stocks from the database of the Short-term Bonds Register held at the CNB.

The data on portfolio investment stocks are published in the i.i.p. within three months of the end of the reporting period. The methodological definition of portfolio investment stocks is identical to that applied to the relevant financial account transactions.

Portfolio investments are valued using the market prices valid on the date to which the statement relates.

14.1.4 FINANCIAL DERIVATIVES

As in the financial account, the stocks of receivables and payables from financial derivatives in the i.i.p. are recorded only when a resident commercial bank participates in the
transaction. In the other cases, financial derivatives are not monitored.

The monthly position of commercial banks vis-à-vis non-residents show the real stocks of financial derivatives which are recorded quarterly in the i.i.p. A more detailed breakdown by instrument is available and a breakdown by sector is in preparation. Data on the territorial and currency structure of these levels are not yet available. The levels of financial derivatives are available within 20 days of the last day of the reporting period.

Market price valuation is provided for in the banks’ balance sheets.

**14.1.5 OTHER INVESTMENT**

The stocks of financial assets and liabilities in the other capital item are compiled and disseminated monthly for commercial banks and quarterly for other sectors. The financial assets and liabilities of commercial banks and other monetary institutions and the positions of the government and corporate sector, including households, are reported quarterly within the i.i.p.

The stocks of other investments are broken down by instrument, sector and maturity. Breakdowns by country and by currency are not recorded for the time being, but are available for selected sectors (commercial banks and the government sector).

The following data sources are used:
- for the position of banks including the central bank: monthly statements on the position vis-à-vis non-residents;
- for the government sector position: surveys of the stocks of assets and liabilities of the government sector prepared for the needs of the Czech MoF by the CNB and by the commercial bank designated for the administration of government foreign assets and liabilities;
- for the position of other sectors: outputs from the fulfilment of the residents’ reporting obligations prepared by the CNB on draw-downs and repayments of financial credits granted to residents from abroad and on turnovers of funds on residents’ accounts maintained abroad, and the quarterly foreign assets and liabilities statements submitted by companies to the CNB.

In the case of the banking and government position, and partly also the position of other sectors, real stocks of receivables and payables are collected; in the case of selected items (for example, financial credits drawn down by companies from abroad), the accumulated flows method is used.

**14.1.6 RESERVE ASSETS**

Data on reserve assets stocks are compiled and disseminated monthly in accordance with the SDDS system within seven days of the reference month in preliminary form, based on data sources from the Accounting and Dealing Divisions of the CNB. The data become final approximately one month later in accordance with the CNB accounting data. The CNB reserve assets are broken down by type of instrument.

The coverage and concept of the reserve assets is in line with the BPM5 and the Operational Guidelines of the IMF Data Template on International Reserves and Foreign Currency Liquidity, and all components, including gold, are valued in market prices monthly.

**14.2 DEVIATIONS FROM AGREED DEFINITIONS**

None.

**14.3 GAPS**

At present, there is incomplete statistical coverage of the financial derivatives item. Stocks held by sectors other than commercial banks and other monetary institutions are not reported. In the area of other investment, the household sector is not sufficiently covered statistically.
14.4 INTENDED HARMONISATION

In order to enhance the quality of the statistics of portfolio investment, the development of the current data collection system will be headed towards reporting on security-by-security basis, i.e. by individual securities using ISIN or similar codes.

A preliminary phase is currently running which involves the reporting of the i.i.p. broken down by country.

An improvement to the statistical coverage of the economic activities of the household sector is being prepared in cooperation with the CZSO.

14.5 ESTIMATION METHODS

Estimates are currently used for the intra-year stocks of reinvested earnings for the direct investment item.

15 CONTACTS

This country information was drafted by the Czech Republic and agreed with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press Division of the ECB. Enquiries specific to the Czech Republic should be addressed to:

1 As of 1 January 2005
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Responsibility for the collection and compilation of balance of payments (b.o.p.) statistics is shared between Statistics Denmark and Danmarks Nationalbank. Statistics Denmark is the official compiler of the Danish b.o.p. Danmarks Nationalbank collects all settlement data and is responsible for defining the regulations for and processing the reports on all payments to and from other countries. In addition, it collects, compiles and analyses data on the international investment position (i.i.p.), direct investment and other external assets and liabilities.

In the past, the collection and compilation of Danish b.o.p. statistics were partly determined by foreign exchange regulations. Since Denmark’s accession to the European Union (EU) in 1972, there has been a gradual liberalisation of exchange controls. The exchange controls in Denmark were totally abolished in 1988.

Since the impact of external transactions on the Danish economy is considerable, monthly b.o.p. statistics are seen as an essential ingredient of general economic policy. The present collection and compilation system was implemented in 1998. Joint preparations have been started by Statistics Denmark and Danmarks Nationalbank to introduce a new collection system based on direct reporting as from the beginning of 2005.

2.2 LEGISLATIVE PROVISIONS

The legislative provisions for the collection of b.o.p. statistics in Denmark are laid down in the “Executive Orders on Foreign Exchange Regulations” by the Ministry of Economic Affairs. The system in place is based on the “Executive Order on Foreign Exchange Regulations” issued on 11 July 1994. The detailed regulations, reporting forms, etc. for b.o.p. statistics are based on Danmarks Nationalbank’s “Udlandsbetalinger-Indberetningsforskrifter” of October 2002.

2.3 INTERNAL ORGANISATION

(i) Statistics Denmark
The Balance of Payments Section of Statistics Denmark is part of the national accounts office.

(ii) Danmarks Nationalbank
In the area of statistics at Danmarks Nationalbank, 19 staff members are working in the section of b.o.p. and i.i.p. statistics.

2.4 EXTERNAL COOPERATION

Statistics Denmark and Danmarks Nationalbank liaise with one another on the compilation of data for the current account and, in particular, the trade in goods items. For purposes of producing current account data, external trade statistics (transactions-based data compiled by Statistics Denmark), replace payments on trade in goods and the difference between the settlement date and the transaction date from settlement reporting (change in trade credits) are taken into account for the compilation of the current account. In addition there is an ongoing comparison at enterprise level between the reporting for the external trade statistics and the settlement statistics of Danmarks Nationalbank, as well as an ongoing comparison between the reporting for the national accounts and the settlement statistics. This comparison improves the compatibility of the two statistics, in general, and the settlement statistics on transactions without effective payments (setoff transactions) and on payments on merchanting, in particular.

Financial institutions are important external contacts. They are the main providers of settlement data, as well as users of b.o.p. and i.i.p. statistics. For these reasons, Danmarks Nationalbank maintains close and continuous contacts with these institutions.
At the international level, b.o.p. and i.i.p. statistics are discussed with other central banks, particularly those in the Scandinavian countries.

### 2.5 Users

Data on b.o.p. statistics, the i.i.p. and direct investment are sent to the European Commission (Eurostat), the ECB, the Organisation for Economic Co-operation and Development (OECD) and the International Monetary Fund (IMF). Domestically, the data are forwarded to Statistics Denmark, the Ministry of Finance and the Ministry of Economic Affairs. Data on International Banking Statistics are sent to the Bank for International Settlements (BIS).

### 3 Statistical System

#### 3.1 Type of Collection System

The reporting system is a ticket-based closed system in which all transactions that change an individual bank’s external position are reported.

The reporting system consists of two different collection systems. Almost all transactions concerning portfolio investment (i.e. trading as well as yield/redemption instalments) are automatically reported by the banks without their customers being contacted. These reports are made in what is called the “securities system”. Recording is carried out transaction-by-transaction. The values of the transactions in securities are split into the value of the security, accrued interest, forward premium and charges, fees, commissions, etc.

All kinds of transactions which change an individual bank’s external position are reported in the “transfer system”. Transactions are registered automatically on the basis of the bookkeeping and information is exchanged between the banks indicating the residence status of the owner of the debited account.

Whenever resident customers (non-banks) are involved in the transaction, they are required to inform the bank of the purpose of payment and the country of the non-resident counterpart. This information is collected through home banking links or via other means of communication between the bank and the customer. The purpose of payment is forwarded to Danmarks Nationalbank as a four-digit code or as a one-digit code with a supplementary text.

When Danish enterprises and households hold accounts abroad, each transaction is reported directly to Danmarks Nationalbank if the gross transactions exceed DKK 5 million (€700,000) on a monthly basis. For holders of accounts abroad who use those accounts almost solely for collecting revenue on exports, the threshold for direct reporting might be higher. Holders of accounts abroad are asked to reply to a monthly questionnaire on these payments. In addition, there is direct reporting on transactions that are settled as net payments or without effective payment (set-off transactions). Typically, these respondents have affiliates abroad.

The main features of the reporting system are described in more detail in Danmarks Nationalbank’s “Monetary Review”, 2nd quarter 1999.

The MFIs’ and Danmarks Nationalbank’s own transactions in financial account items are reported directly through a new system established in 2003. This means that MFIs’ and Danmarks Nationalbank’s own transactions are measured net. Changes in stocks in Danmarks Nationalbank’s balance sheet reflect transactions at the market prices at the time of the transactions. The MFIs’ financial transactions are derived from stocks at market value adjusted for price changes, exchange rate changes and other changes. As a result, the flow data are in accordance with the recommendations of the ECB and International Monetary Fund (IMF).
3.2 REPORTING AGENTS

Banks report all relevant payments handled by the banking sector. Today, about 60 banks are reporting settlements on behalf of customers and for their own account.

Other residents report payments via accounts held abroad as well as set-off/netting transactions directly to Danmarks Nationalbank. For the time being, approximately 260 residents report transactions via accounts held abroad directly to Danmarks Nationalbank on a monthly basis and 135 residents report set-off/netting transactions.

3.3_THRESHOLDS

Most payments related to securities transactions are reported in the securities system regardless of any threshold.

In the transfer system, other payments in excess of DKK 100,000 (€13,400) were reported individually until 1 October 2002, with information on the purpose of the payment, including the economic code, and the identification of the resident ordering customer/beneficiary. Payments of less than DKK 100,000 (€13,400) are reported on a monthly basis, without information on the purpose of the payment or customer identification. On 1 October 2002, two thresholds were introduced: an exemption threshold of DKK 100,000 (€13,400) and a simplification threshold of DKK 250,000 (€34,500).

Payments related to transactions in which the banks themselves take part are reported regardless of any threshold. These transactions are reported in aggregate form, so that the purpose of the payment and country codes is preserved.

Transactions via accounts held abroad are reported directly to Danmarks Nationalbank by the reporting agents, regardless of any threshold.

3.4 AVAILABILITY OF DATA

Statistics Denmark and Danmarks Nationalbank compile b.o.p. data which have, since January 1997 for monthly data and as from the first quarter of 1997 for quarterly and annual data, to a large extent been in line with the harmonisation proposals agreed within the former Task Force on Financial Flows and Stocks.

3.5_TIMELINESS

The complete b.o.p. is published approximately 30 working days after the end of the reporting period. Data for financial account items are published on the 18th banking day following the end of the reporting period. Transaction-based data are transmitted to ECB after 30 working days. They are confidential until the data on trade in goods are released.

3.6_COMPILATION FREQUENCY

The Danish b.o.p. is compiled on a monthly basis.

3.7_DATA CONTROLS

The reporting system facilitates several types of data control.

Validation procedures are incorporated into the electronic data collection system. If the information in a report is not valid, the bank is immediately prompted for correct information and the report is not accepted until valid and consistent information has been given.

The next level of control concerns the interpretation of the specific information in the reports. For instance, it is investigated whether exchange rates are used correctly, whether market values are reasonable on comparison with nominal values, whether country codes for issuers of securities are used consistently and whether there are any systematic differences in the use of purpose-of-payment codes.

For transactions in which one bank represents the resident and pays or receives payments from abroad via another bank, both banks have an obligation to report. The details reported are matched to ensure reporting by the bank representing the resident, even though the external position of the bank may have remained unchanged.

The reporting system provides the basis for comparing the balance sheets of banks with reported payments. As a start, various items are investigated, e.g. transactions in repurchase agreements and securities issued by non-residents are compared with the changes in the individual banks’ accounts for repos and holdings of foreign securities. Moreover, non-residents’ holdings of Danish securities issued in Denmark and registered at the Danish Securities Centre are compared with the flow statistics.

### 3.8 REVISION POLICY

All revisions as from 1998 are included in the month to which they relate. For the time being, there is no revision policy in place with respect to publishing the full b.o.p., i.e. at present all
revisions are published in the first subsequent release. However, a revision policy for settlement statistics – which is the main source of compilation – and for quarterly data on direct investment was put in place in September 2000.

(i) settlement statistics (including financial account items)
   - continuous revision of the two previous months;
   - revision of the previous and current years at end of every quarter;
   - revision of all previous years once a year in September.

(ii) direct investment (quarterly data)
   - continuous revision of the previous and the current years;
   - revision of the previous years with the third quarter.

Apart from these regular revisions, an extraordinary revision of data is carried out upon first release if significant revisions in the reported information change the overall picture of the b.o.p. items.

3.9 PUBLICATION

Danmarks Nationalbank publishes monthly b.o.p. data for financial account items on a settlement basis in “Nyt” and the “Tables supplements”.

“Nyt” is published in accordance with the above-mentioned time schedule and contains data of limited detail covering a limited period. The “Tables supplements” contain more detailed figures.

The “Nyt” publications and “Tables supplements” are only issued electronically as pdf files on Danmarks Nationalbank’s website. On 29 October 2003 Danmarks Nationalbank placed a new statistics database on its website (under “Download Statistics – Database”). It contains more than 10,000 time series on 10 different topics and will soon cover the entire spectrum of financial statistics published by Danmarks Nationalbank.

Two other publications of Danmarks Nationalbank, the “Monetary Review” and the “Annual Report”, contain extracts of data from the “Financial Statistics”, together with b.o.p. data on a transaction basis.

Publications released by Danmarks Nationalbank are available on the website of Danmarks Nationalbank at http://www.nationalbanken.dk.

The titles of the publications produced by Danmarks Nationalbank on b.o.p. statistics are listed in Sub-section 13.1.

4 IMPLEMENTATION

4.1 MONTHLY BALANCE OF PAYMENTS

Deviations from the 5th edition of the IMF Balance of Payments Manual (BPM5) (Monetary Union harmonisation proposals) are unavoidable for the monthly b.o.p. data, as a result both of their prospective use for monetary and exchange rate policy purposes in Stage Three and of constraints related to timeliness. However, Danmarks Nationalbank has provided the European Monetary Institute (EMI)/European Central Bank (ECB) with national aggregate b.o.p. data, broken down into key items, as from the January 1997 reporting period.

A decision to forward data on a transaction basis, rather than on a settlement basis, was taken in June 1999. The rationale for forwarding data on a transaction basis is that it meets the requirements of the BPM5 and eliminates the inconsistency between monthly
and quarterly data. Furthermore, these are the official Danish b.o.p. data.

Data on a settlement basis are compiled by Danmarks Nationalbank. These data are used as input for Statistics Denmark’s elaboration of the official b.o.p.

Statistics Denmark and Danmarks Nationalbank are able to compile a country-by-country geographical breakdown for most b.o.p. items. Statistics Denmark assumes that it will be in a position to provide a euro area/non-euro area split for current account data and to prepare an assets/liabilities euro area/non-euro area breakdown. A geographical split has been published for the financial account items since January 2003.

The methods and sources used to produce monthly and quarterly data are the same. Therefore, the evaluation of methodology and breakdowns is discussed in the following sections.

4.2 ESTIMATION METHODS FOR THE MONTHLY B.O.P. DATA

At the time monthly data are published, the coverage of respondents is close to 100%, except in the case of enterprises with accounts abroad and netting payments. The coverage of direct reporting, for which the main source is reporting from enterprises with accounts abroad, is normally around 95%.

It is inherent in a settlement system that estimation is unnecessary.

4.2.1 FOR GOODS

The only item of estimation is goods, where Statistics Denmark uses grossing-up in the Foreign Trade Statistics to estimate flash data. At the time of first publication, only 70% of all reports have been received. The estimation method is based on the use of a panel of reliable reporters and grossing-up.

After first publication, VAT statistics are used for grossing-up Foreign Trade Statistics and thereby the item goods. Grossing-up is based on a partial inclusion of positive differences between the VAT statistics and Intrastat figures.

The geographical breakdown for intra-EU trade refers to the country of consignment/destination.

No estimations are made on military goods.

Transactions under special Community programmes are not recorded in any special way. No estimations are made.

For imports, a c.i.f./f.o.b. adjustment is made by applying a rate of 3.7% to the c.i.f.-based imports of foreign trade statistics.

4.2.2 FOR SERVICES

Services are compiled through the settlement system. This implies that only payments above the threshold are identified.

4.2.3 FOR INVESTMENT INCOME

Estimation is used for retained earnings. Information on earnings is received from 1,500 groups encompassing 2,800 companies in the yearly i.i.p. survey. Earnings on direct investment are identified and dividends paid are deducted. No grossing-up is used for retained earnings.

4.2.4 FOR DIRECT INVESTMENT

No estimation used.

4.2.5 FOR PORTFOLIO INVESTMENT

No estimation used.

4.2.6 FOR FINANCIAL DERIVATIVES

No estimation used.

4.2.7 FOR OTHER INVESTMENT

No estimation used.
4.3 MONTHLY B.O.P. – IMPLEMENTATION PLAN

See Table 2.

4.4 IMPLEMENTATION OF THE BPM5

As in the case of most Member States which essentially collect b.o.p. data on cross-border settlements, the most difficult problems encountered in the implementation of the BPM5 relate to the coverage of transactions where no settlement takes place.

Most of the conceptual recommendations made by the IMF have been implemented. Those areas where deviations may remain after the implementation of the BPM5 are indicated in the various categories in Sub-sections 5 to 12.

4.5 STANDARD COMPONENTS – QUARTERLY AND ANNUAL

The settlement statistics for 1995 and onward have been brought into line with the recommendations of the BPM5. The official b.o.p. figures, released by Statistics Denmark, comply with the BPM5 as of 1988, with some minor exceptions.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

See Sub-section 3 for a description of the data collection system.

There is an annual review of the income on portfolio and direct investment with the aim of recognising the return on direct investment included in the securities part of the settlement system.

Income from collective investment institutions is not identified. For the time being, income from collective investment institutions is assumed to be a minor issue.

5.2 DEFINITIONS

Except for the deviations mentioned below, data fulfil the requirements of the ECB. In respect of the geographical breakdown, reliable data from 1999 and onwards is planned to be available in the future.

Investment income includes reinvested earnings on direct investment and discounts/premiums on Danish debt securities registered at the Danish Securities Centre (in practice, equivalent to Danish securities quoted on the Copenhagen Stock Exchange). Data on reinvested earnings are collected annually by Danmarks Nationalbank by means of a survey of enterprises with direct investment relationships (see Sub-section 12 on the i.i.p.). Statistics Denmark is responsible for the calculation of the discounts/premiums on the Danish debt securities referred to above.

Dividends are recorded as of the date they are paid.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

Deviations are related to discounts/premiums on debt securities other than the securities mentioned in Sub-section 5.2.

Income on trade credits between affiliates is not included in income on direct investment, but in income on other investment. Income on reserve assets is not included in income on other investment, but is rather distributed according to the underlying instrument.

5.4 GAPS

See Sub-section 5.3.

5.5 INTENDED HARMONISATION

A working group made up of representatives of both Statistics Denmark and Danmarks Nationalbank is investigating the issues mentioned in the first part of Sub-section 5.3.

CHAPTER 4.3
DENMARK

Income on reserve assets will be included in income on other investment in the near future.

5.6 ESTIMATION METHODS
None.

6 CAPITAL ACCOUNT
6.1 SPECIFIC FEATURES OF DATA COLLECTION
The capital account is based on settlement statistics from Danmarks Nationalbank. No breakdown is released, but information on geographical allocation and a sectoral breakdown are available in the settlement statistics.

6.2 DEFINITIONS
The definition of the capital account is in line with the BPM5. The implementation of the recommendations has been difficult, as the broad statements in the Sections 295 and 303 of the BPM5 are not very precise, and Danmarks Nationalbank also relies on the subsequent chapters, including Section 350, in which legacies, for instance, are mentioned indirectly as a capital transfer. Other sources of interpretation of the BPM5 are the report entitled “Improvement and Harmonisation of the EU/EFTA balance of payments – Report of Task Force 2 Current account” and the ECB’s report on the same issue.

The basic problem of interpretation is that of separating capital transfers from current transfers. A borderline case for codification in Denmark is the treatment of legacies and gifts, where gifts above DKK 5 million (around €700,000) are recorded as capital transfers, because they are assumed mainly to affect the savings, rather than the consumption of the beneficiaries.

Of course, the obvious cases, for instance, of governmental debt forgiveness of lending to developing countries are also included.

Estimation of migrants’ transfers below the threshold has been done since 2000.

The change of residency caused by the statistical omission of the Faroes and Greenland from the economic territory of Denmark has been included as a capital transfer in July 2000.

6.3 DEVIATIONS FROM THE AGREED DEFINITIONS
The present definition is that all migrants’ and immigrants’ transfers of deposits/loans held with Danish banks are included in the capital account.

EU transfers are compiled as current transfers. No decision has been taken on what EU transfers to include in capital transfers.

6.4 GAPS
Migrants’ and immigrants’ assets/liabilities other than those held with banks are not covered.

Full data on investment grants made by general government are not available.

Data for private sector debt remission are not available, but are believed to be insignificant.

6.5 INTENDED HARMONISATION
Danmarks Nationalbank plans to investigate the gaps mentioned above, but this is not considered to be of very high priority.

7 DIRECT INVESTMENT
7.1 SPECIFIC FEATURES OF DATA COLLECTION
Danmarks Nationalbank collects data on direct investment flows and stocks from two different sources: the general settlements reporting system and a sample survey of enterprises. The survey was carried out at the end of the years 1991, 1994, 1996 and 1998. It was decided that,
as from the 1998 survey, the survey should be conducted annually. In principle, the combination of these two sources leads to a good coverage and quality of direct investment data. Some items, such as reinvested earnings and trade credits between affiliated enterprises, are derived from stock data and are, therefore, only available on an annual basis.

Monthly data on reinvested earnings are included in the transaction-based b.o.p. statistics, but not, at present, in the settlement statistics.

Until data for reinvested earnings are available from the survey, data are calculated as residuals from estimates on total income on direct investment; i.e. monthly reinvested earnings are calculated as one-twelfth of total estimated direct investment income for the year minus actual dividend payments. Direct investment income is estimated on the basis of total return on direct investment in earlier years (separately for inward and outward investments).

Financial derivatives between affiliated enterprises are identified and included under financial derivatives.

In the event of a change in ownership of a resident company from a non-resident to another non-resident direct investor being revealed by the survey, the change is recorded in the FDI stocks, but not in the corresponding b.o.p. flows.

Transactions settled via an exchange of shares are recorded in the statistics at the time of exchange.

With regard to the valuation of transactions settled by an exchange of shares, an agreed price has been available in all cases so far. If no price is agreed, the market price at the time of agreement will be used.

Quarterly data are published with a detailed breakdown by sector and counterpart country.

Geographical allocation is based on the transactor principle. However, it is under investigation to change the reporting instructions so as to take into account the residency of the actual issuers, i.e. to apply the debtor/creditor principle.

7.2 DEFINITIONS

The definitions of the different concepts used in direct investment statistics are in line with the BPM5 and the OECD benchmark (threshold of 10% ownership, direct investor, direct investment enterprise, direct and indirect relationship). All cross-border transactions in real estate are covered.

When the present collection system was implemented in October 1998, new payment codes were added which took into account the directional principle.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

7.4 GAPS

No detailed information is available on a monthly basis for trade credits between affiliated enterprises. Data are estimated as the difference between transactions and settlement data for all types of goods. However, data on trade credits are available annually, from the stock survey.

It is difficult for the respondents to understand and report their transactions in accordance with the set of codes that implement the directional principle. Except from this, the recording of reverse investment (i.e. investment by the direct investment enterprise in its direct investor) is in accordance with the directional principle.

Non-response is also a problem. Danmarks Nationalbank is trying to cope with this problem using newspapers and other sources. The enterprise in question is then contacted to verify the relevant transaction.
7.5 INTENDED HARMONISATION

Some of the larger enterprises/banks have been contacted in order to explain the directional principle to them, and a more user-friendly description of the codes has been disseminated.

7.6 ESTIMATION METHODS

None.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Portfolio investment is compiled via the so-called securities system. The system contains all securities transactions that might be relevant to the b.o.p. In principle, all transactions involving either a non-resident issuer or a non-resident counterpart/customer or a denomination in foreign currency or a non-resident clearing house or a non-resident fiscal agent are reported.

Portfolio investment is reported by the MFIs via the securities system.

Comparisons of Danmarks Nationalbank’s information with settlement statistics from other sources suggest that the main part of the central bank’s settlement data are reliable. Comparison of settlement data and balance sheet statistics has proved to be useful. As a result of these comparisons, errors related to single banks have been identified and eliminated. Comparison with the balance sheets for large institutional investors has also proved to be fruitful.

Another feature of electronic reporting is that reporting on portfolio flows is received at the settlement date, which means that extensive statistics on portfolio flows are available within only three days.

Not all information on portfolio flows comes from the settlement system. As mentioned in Sub-section 3, banking statistics are used, e.g. changes in banks’ holdings of foreign securities. Some differences between banking statistics and settlement data concerning foreign securities still exist, even though the main part has been eliminated.

8.2 DEFINITIONS

The definition of portfolio investment is in line with the BPM5. The guideline is reflected in the structure of the present economic codes and the split between bonds and money market instruments is according to initial maturity.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

The quality of the country split has not been examined in depth. Treatment of securities of supranational institutions is an outstanding technical issue. The quality of the sector split is generally high. Items not allocated to any sector, however, represent a minor issue where further investigation is necessary. In cases where no sector is assigned automatically, trading is allocated to the sector to which it is most likely to belong, given the type of asset.

8.4 GAPS

The gaps in portfolio investment data are the counterparts of the gaps concerning investment income on debt securities which are mentioned in Sub-section 5.

8.5 INTENDED HARMONISATION

None.

8.6 ESTIMATION METHODS

None.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The payments on financial derivatives are based on settlement statistics. No breakdown is
released at present, but information on geographical allocation and a sectoral breakdown are available in the settlement statistics. In addition, net settlements on swaps and FRAs could be separated from other net settlements on derivatives.

The geographical allocation of financial derivatives is based on the transactor.

9.2 DEFINITIONS

The definition of financial derivatives is in accordance with the BPM5. All payments on financial derivatives are considered as belonging to this item, regardless of whether they constitute interest-related payments or foreign exchange of principal-related payments. The codification used by Danmarks Nationalbank distinguishes between, on the one hand, swaps and FRAs, and, on the other, derivatives such as foreign exchange agreements, futures and options. However, no information providing the distinction is released.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

9.4 GAPS

In theory, there are no gaps. In practice, however, significant differences have been experienced as a result of the reporting of principal for swaps. As the amounts of initial and final exchanges in relation to swaps are far larger than other payments, even if only a small number are reported incorrectly this can have a significant impact on errors and omissions. Therefore, Danmarks Nationalbank runs a dedicated check on the largest payments on derivatives, which is designed to identify individual payments not matched by an offsetting payment for the same company.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Payments on financial derivatives are not estimated.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Other investment related to the MFI sector is derived from changes in balances in the MFI statistics.

Trade credit is defined, by nature, as the difference between settlement data and transaction data. Trade credits calculated by the method above are not replaced by other sources.

10.2 DEFINITIONS

The definition of other investment is in line with the BPM5, except for the deviations referred to in Sub-section 10.3.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

The flows of other investment are reported by banks for transactions between residential accounts and foreign accounts. Loans and deposits involving foreign counterparts, which are successively invested abroad without domestic roll-over are not, with a few exceptions, reported in the settlement system. Thus the settlement system focuses on the flows between residents and non-residents. With the implementation of the new MFI statistics, Danmarks Nationalbank is able to take account of the change of counterpart in roll-overs of loans and deposits.

The new Monetary Financial Institution (MFI) statistics provide the maturity breakdown by long and short-term investment for the MFI sector. For the remaining sectors, no maturity breakdown is available, except for a maturity breakdown on trade credits.
10.4 GAPS

None.

10.5 INTENDED HARMONISATION

At present, there is a discrepancy in the treatment of financial leasing between the national accounts and the settlement statistics. One issue is consistency between financial assets exported/imported for leasing and the corresponding loan, and another issue is the allocation of the financial leasing to interest and redemption. This issue is being investigated by a working group made up of representatives of both Statistics Denmark and Danmarks Nationalbank.

10.6 ESTIMATION METHODS

None.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Changes in the relevant items in the balance sheet of Danmarks Nationalbank.

11.2 DEFINITION

At present, changes in the net external position of Danmarks Nationalbank comprise monetary gold, SDRs, the reserve position in the IMF and foreign exchange (net). In practice, all external assets of Danmarks Nationalbank are readily available to (i.e. highly liquid, marketable and creditworthy) and controlled by Danmarks Nationalbank, are claims on non-residents and are denominated in foreign currency (i.e. in currencies other than the Danish krone). For accounting details, see Sub-section 3.1 above. Holdings of the general government are not included. Reserve assets are compiled on a gross basis, i.e. liabilities are registered under other investment.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIAL FEATURES OF DATA COLLECTION

Danmarks Nationalbank produces yearly i.i.p. data within nine months of the year-end. The data are pure stock data based on sample surveys of enterprises, MFI statistics (which, from 2000, have replaced the former banking statistics), information on securities held in custody by banks for enterprises and households, debt securities statistics from the Danish Securities Centre showing non-residents holdings’ of Danish debt securities quoted on the Copenhagen Stock Exchange and the annual accounts of central government and Danmarks Nationalbank. The sample surveys are conducted on a yearly basis and cover the private non-banking sector, local government and social security funds.

Furthermore, Danmarks Nationalbank publishes quarterly i.i.p. data based on stock data and projections based on transactions in the reporting period. Data are published approximately 2½ months after the end of the reference period.

There is currently no geographical allocation in either the annual or the quarterly i.i.p. statistics. However, in the yearly i.i.p. statistics, direct investment is broken down by country. Furthermore, there are plans to introduce a geographical allocation in both annual and quarterly i.i.p. statements.
Denmark participated in the 1997 IMF Co-ordinated Portfolio Investment Survey. Due to a new system of quarterly i.i.p., Denmark is able to provide most of the non-mandatory items and will participate in the coming IMF Co-ordinated Portfolio Investment Survey and on a regular, yearly basis.

12.2 DEFINITIONS

12.2.1 GENERAL
With minor exceptions, the concepts and definitions used are in accordance with the BPM5 and the recommendations made by the Working Group on Balance of Payments and External Reserves Statistics.

12.2.2 DIRECT INVESTMENT
Direct investment is compiled according to the directional principle. Direct investment includes reinvested earnings. Direct investment is valued at market prices if the company is listed on a stock exchange and valued using the equity method for all other companies.

12.2.3 PORTFOLIO INVESTMENT
Portfolio investment is valued at market price.

12.2.4 FINANCIAL DERIVATIVES
Data on financial derivatives are recorded on a gross basis. Financial derivatives are valued at market price in accordance with the recommendations of the Working Group on Balance of Payments and External Reserves Statistics. Futures with daily margining are excluded from the statistics.

12.2.5 OTHER INVESTMENT
Trade credits, loans and deposits are valued at book values, which are normally equal to their nominal values.

12.2.6 RESERVE ASSETS
Reserve assets are recorded at closing mid-market prices at the end of the appropriate period using the closing mid-market exchange rates prevailing at the reference date.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
Mortgages are classified as debt securities because Danish mortgages are traded in an organised market.

12.4 GAPS
Small enterprises’ and households’ holdings of securities, which are held in custody abroad, as well as their loans and deposits with foreign-owned banks abroad are not covered by the sample survey. Non-residents’ holdings of equity securities issued by Danish enterprises which are held in custody abroad and not re-deposited in Danish banks are not covered either.

12.5 INTENDED HARMONISATION
None.

12.6 ESTIMATION METHODS
Private, non-commercial real estate investment is estimated on the basis of registered payments concerning private, non-commercial real estate investment and “inflated” using a price index.

13 ADMINISTRATION

13.1 TITLES OF PUBLICATIONS
The titles of the publications on b.o.p. statistics produced by Danmarks Nationalbank are:

“Nyt” – monthly data (financial account items only) and direct investment (quarterly) data;
“Monetary Review” – monthly and annual data;
“Annual Reports” – annual data;
“Nyt – direct investment (annual); and
“Nyt – Denmark’s i.i.p. (quarterly).
13.2 CONTRIBUTORS

This country information was drafted by the ECB’s External Statistics Division and subsequently amended and agreed with Denmark. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Denmark should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Deutsche Bundesbank (named the Bank Deutscher Länder prior to 1957) has been responsible for drawing up the balance of payments (b.o.p.) for the Federal Republic of Germany since 1949. In the early years the reporting was linked to the foreign exchange control system in place until the end of the 1950s. The gradual relaxation of the external controls and the transition to full convertibility of the Deutsche Mark at the end of 1958, associated with a rapid rise in Germany’s external transactions, necessitated the development of a consistent reporting system. Data, which had previously been derived from the foreign exchange controls and the multiplicity of individual reports existing in the mid-1950s, were replaced by a statutory system which came into force in 1961 with the Foreign Trade and Payments Act (Außenwirtschaftsgesetz).

2.2 LEGISLATIVE PROVISIONS

The Foreign Trade and Payments Act (in particular Section 26 thereof) provides the legal framework for the collection of b.o.p. data. The Foreign Trade and Payments Regulation (Außenwirtschaftsverordnung) sets out the data reporting requirements in greater detail. It forms the legal basis for the core of the German data collection system for the b.o.p. It also allows the Deutsche Bundesbank to request more detailed information on direct investment stocks and on the external positions of non-MFIs. Furthermore, Section 18 of the Bundesbank Act of 1957 allows the Deutsche Bundesbank to demand and collect statistics in the field of banking and the monetary system from all credit institutions in order to fulfil its tasks. These data are partly also used for b.o.p. purposes.

The statistical compilation of foreign trade data lies within the competence of the Federal Statistical Office (Statistisches Bundesamt; FSO). The legal framework is set by EU regulations relating to statistics on intra-Community trade and on trade with third countries. Complementing national legislation, namely the Act on Statistics on Cross-Border Trade in Goods (Gesetz über die Statistik des grenzüberschreitenden Warenverkehrs) and the appropriate regulation for its implementation, governs those elements of the external trade data collection that are of national interest and are not regulated by EU legislation.

The Federal Statistics Act (Bundesstatistikgesetz) of 1987 applies to all federal statistics, including b.o.p. statistics, as appropriate.

2.3 INTERNAL ORGANISATION

The Deutsche Bundesbank is responsible for several sets of statistics. The Statistics Department of the Central Office of the Deutsche Bundesbank consists of the following four divisions: the Banking and External Stock Statistics Division; the Balance of Payments Statistics Division; the General Economic Statistics Division; and the Statistical Data Processing and Mathematical Methods Division. Apart from MFIs’ balance sheet statistics and special statistics on the banking sector, the first of these divisions is also responsible for collecting and compiling most of the external stock statistics. The overall compilation of the international investment position (i.i.p.), however, is carried out by the Balance of Payments Statistics Division, which is in charge of the compilation of the German b.o.p. and related external statistics.

The General Economic Statistics Division deals with methodological issues relating to business cycle statistics. A variety of other statistics are also compiled by this division, namely statistics on the balance sheets of enterprises, capital market statistics and foreign exchange rate statistics insofar as the ECB has not taken over responsibilities in these fields. The calculations for the financial accounts within the framework of the national accounts are carried out within the Economics Department.
The Balance of Payments Statistics Division is divided into three sections. Section one is responsible for compiling, publishing and documenting the b.o.p. statistics, as well as for all contacts with users. This section also deals with integrating foreign trade statistics into the b.o.p. All other current account transactions (excluding income from financial assets) and capital account transactions are processed by section two. Financial account transactions, income from financial assets, the Deutsche Bundesbank’s external reserves and the i.i.p. are compiled by section three.

The restructuring of the Deutsche Bundesbank following the amendment of the Bundesbank Act in 2002 also entails some organisational changes in the production of b.o.p. statistics. The Hauptverwaltungen (Regional Main Offices of the Deutsche Bundesbank) are no longer responsible for collecting the statistical reports.

Instead, the compilation of b.o.p. and related external statistics is shared between the Balance of Payments Statistics Division of the Central Office and a service centre for external statistics, which was established at one of the regional main offices (Mainz) in mid-2004. While the service centre is in charge of collecting all statistical reports, processing the reports of smaller respondents and carrying out some administrative tasks, the Balance of Payments Statistics Division of the Central Office checks and processes the data of the larger respondents and compiles the overall German b.o.p. and related external statistics.

A further change concerns the auditing of MFIs with respect to their compliance with the Foreign Trade and Payments Act and the corresponding regulation (including statistical reporting). The Hauptverwaltungen are no longer in charge of these activities. Instead, four service centres have been established in four regional main offices to conduct audits of financial institutions. Coordination of these audits is done by a new group within the Balance of Payments Statistics Division of the Central Office.

It is planned that the Balance of Payments Statistics Division in the Central Office will finally have around 90 staff members after the full transition to the new organisation. Once the transition is complete, the statistical service centre will have around 50 staff members and the four audit service centres will have a total of 47 staff members.

### 2.4 EXTERNAL COOPERATION

The FSO is the most important external partner of the Balance of Payments Statistics Division, both as a provider and as a user of data. The foreign trade statistics provided by the FSO are used as the basis for ascertaining transactions in goods for the German b.o.p. The FSO also provides some complementary data for estimation purposes. Information from private research institutes on workers’ remittances and travel are also used, partly for cross-checking and partly for estimation purposes.

The Deutsche Bundesbank attempts to involve – to the greatest extent possible – associations of banks and other enterprises in discussions prior to important changes to the reporting requirements and procedures. This cooperation is aimed at improving the acceptance of statistical requirements, and thus at increasing the reliability of reported data. As a result of the reorganisation of statistical tasks within the Deutsche Bundesbank, the Central Office and the above-mentioned service centres will maintain direct contacts with the major reporting companies, including the provision of training and addressing any other requests of respondents.

In addition to multilateral cooperation within the numerous working groups of various European and international organisations, the Balance of Payments Statistics Division also maintains bilateral contacts with other central banks in order to exchange views on issues of common interest.
2.5 USERS

B.o.p. data are used for the ROW account in the national accounts statistics, which are produced by the FSO as far as current account transactions are concerned (whereas financial accounts statistics are covered by the Deutsche Bundesbank). Information is also exchanged continuously with the internal users of the b.o.p. and i.i.p. data, i.e. the division responsible for analysing external economic relations and the section responsible for compiling the national financial accounts.

The Federal Ministry of Economics and Labour (Bundesministerium für Wirtschaft und Arbeit) is an important user of information on direct investment data.

Other important users are private and public research institutes and universities; banks, associations of banks and enterprises address the bulk of enquiries to the Balance of Payments Statistics Division.

The entity responsible for the delivery of reports is the resident economic entity, MFI or non-MFI, which carries out a transaction with a non-resident and/or the resident economic entity where the change of ownership occurs. Certain items (e.g. securities, travel) are reported by MFIs on behalf of their customers.

Where necessary, the data gained from this general reporting framework are supplemented with data from various other sources (e.g. a household survey to compile the debit side of the travel account) and with estimates.

Short-term financial transactions in loans and deposits are excluded from the German ITRS; instead, they are derived from end-month stock data on the outstanding external assets and liabilities of MFIs and non-MFIs.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The German b.o.p. data collection system is classified as an open international transactions reporting system (ITRS); much of the data is collected directly from companies.

3.2 REPORTING AGENTS

(i) All economic agents, enterprises, MFIs (see below for MFIs’ special reporting obligations), individuals and public authorities must report all external transactions on a monthly basis. Only outgoing payments settled by payment order through domestic bank accounts are reported when they are carried out by forwarding a copy of the payment order form to the Deutsche Bundesbank.

(ii) Foreign assets and liabilities of resident non-MFIs are also reported on a monthly basis. The figures are used to derive the short-term financial transactions of non-MFIs for the b.o.p. (including trade credits). In addition, there is an annual survey on direct investment stocks which covers non-MFIs and MFIs.

(iii) MFIs have the same reporting obligations as enterprises, individuals and public authorities, but are also subject to special reporting requirements. For travel, MFIs must report the purchase and sale of the means of payment. Interest and dividends paid to non-residents on domestic

</table>
securities (without an exemption threshold) should be reported on a monthly basis. With regard to financial transactions, MFIs have to report securities transactions with non-residents for their own account and on behalf of other residents on a monthly basis. The short-term cross-border financial transactions of MFIs are derived from their monthly balance sheets.

(iv) Public sector: information on reserve assets is derived from the Deutsche Bundesbank’s accounts. In addition, the government sector is subject to the regular reporting requirements described above.

3.3 THRESHOLDS

A general exemption threshold of €12,500 (DEM 5,000 before January 2001) is applied to the transactions of all economic agents, enterprises, MFIs, individuals and public authorities.

For resident non-MFIs, any foreign assets or any liabilities exceeding €5 million in total are reported on a monthly basis.

MFIs have to report all their stocks of foreign assets and liabilities on a monthly basis without applying any threshold.

3.4 AVAILABILITY OF DATA

Only quarterly and annual data on major items are available for the years from 1949 to 1955. Monthly figures are available from 1956 onwards. The breakdown of the b.o.p. was extended until 1971, when it essentially took on its present form. As a result of new developments and changing needs, however, additional items were recorded and the available components were combined in a different form. From the outset, the Deutsche Bundesbank has adhered in its statistical work to the recommendations made by the IMF. The most recent changes in the presentation of the German b.o.p. were due to its adaptation to the BPM5 in early 1995 and in January 1999 (reflecting the start of EMU). A complete b.o.p. is available on a monthly basis and, in principle, with a full geographical breakdown by country. For some countries, however, bilateral data are not available for travel and, depending on the sampling error, no bilateral data for services or even the current account can be made available.

3.5 TIMELINESS

Data become available within six weeks.

3.6 COMPILATION FREQUENCY

The German b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

As a result of the Deutsche Bundesbank’s reorganisation, data controls are now done either by the Balance of Payments Statistics Division in the Central Office (for large enterprises) or by the statistical service centre (for small enterprises). Apart from the organisational changes, data control procedures have remained broadly the same. All major transactions are checked individually for plausibility. Reporting agents are contacted, if necessary, for the clarification of doubtful elements of the reports. Unusual fluctuations in the monthly data reported by large enterprises are monitored and the reporters are asked for an explanation.

Internal checks with other statistics, e.g. custodian statistics for portfolio investment transactions, are carried out. The media are used to detect possible reporting gaps. Stock and flow data are available for direct investment and can thus be matched for each individual reporting enterprise. A cross-check of aggregates on stocks and flows from the i.i.p. and the b.o.p. is performed twice a year when the i.i.p. is compiled.

Alternative data sources can be used for some items to evaluate the quality of data recorded in
the b.o.p. (travel, for instance), although such sources are usually only available with a long delay. Moreover, the Deutsche Bundesbank has attempted to assess the quality of German b.o.p. data by performing several bilateral comparisons with other EU countries. In the context of the national accounts statistics, b.o.p. data are subject to further plausibility checks, as the results of the b.o.p. statistics should be compatible with other data on the general economic situation.

Finally, the reporting MFIs are inspected at regular intervals. Four service centres in four regional main offices are responsible for conducting these inspections. Non-MFIs are inspected by the public authorities responsible for ensuring the observance of regulations on external transactions (Oberfinanzdirektionen). Special checks can be arranged if an enterprise is suspected of repeatedly or deliberately failing to meet the reporting requirements.

3.8 REVISION POLICY

Revisions of the (provisional) monthly figures are published together with the (provisional) data for the following month. Revised annual data are published in March when revised figures for the previous three years are also given. Apart from these regular revisions, additional ad hoc revisions are undertaken in order to take into account major corrections as a result of new information from respondents or corrections in foreign trade data by the FSO. In the case of an important methodological change, revisions of historical data usually take place. In that event, time series are recalculated so as to avoid breaks and to ensure the comparability of data over time. Such major recalculations were necessary following the implementation of the BPM5 recommendations. More recently, services time series have been recalculated following changes in the basic data sources used to estimate travel services.

3.9 PUBLICATION

The first monthly b.o.p. data are published six to seven weeks after the end of the reference period. The preliminary results for the annual b.o.p. are therefore available in mid-February of the following year. A full regional breakdown is published on a quarterly basis only. The annual b.o.p., together with a regional breakdown for the past year and the previous three years, is published in July of the following year.

The titles of the publications produced by the Deutsche Bundesbank on b.o.p. statistics are listed in Sub-section 13.1.

All data, as well as a one-year calendar including the dates on which press releases are to be issued, are published on the internet (http://www.bundesbank.de).

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

All data for the requested monthly b.o.p. items are available as from 1995. Foreign trade is included on an f.o.b. basis in the monthly b.o.p. dating back to 1995. A geographical breakdown for EU Member States can be provided on a country-by-country basis. The timeliness of data availability is six weeks. Also within six weeks, trade data are available for intra-euro area, intra-EU/non-euro area and third countries. Country-by-country trade in goods data are only available after a further five weeks.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

Monthly and quarterly b.o.p. data are fully consistent. They are derived from the same set of (monthly) data. No special estimation methods are carried out to meet the timeliness of the monthly b.o.p. data except for trade in goods. For trade in goods, a euro area/non-euro
area split is applied by the FSO prior to the availability of a full country-by-country breakdown. For imports, the monthly transformation of the data to the f.o.b. basis is based on preliminary estimates.

4.2.1 FOR GOODS
The sources for data on trade in goods are the foreign trade statistics (Intrastat and trade with third countries) compiled by the FSO. The data are available monthly and correspond to a transaction basis. Adjustments based on fiscal data are made by the FSO for non-responses.

Monthly data for imports are valued on an f.o.b. basis. All data are seasonally adjusted by applying a Census X-based procedure.

The geographical breakdown of data is derived from Intrastat and customs documents. Imports within the euro area are allocated according to the country-of-consignment principle. Transactions with residents of non-participating Member States can be identified separately. The provision of the intra/extra-euro area breakdown by the FSO is essential.

Data for trade in goods are compliant with BPM5 standards as far back as 1971. Time series breaks were caused by German reunification (1990) and changes in trade statistics (1988 and 1993).

Trade data are calculated on the basis of the special trade principle. However, warehouse transactions with non-residents are included.

Military goods are, in principle, included in the goods item of the b.o.p. with the same geographical breakdown.

Transactions under the special Community programmes (Satellite, Airbus and others) are recorded in the foreign trade item, and the geographical allocation is performed the same way as for the other transactions in this item.

As a result of the implementation of Intrastat in the foreign trade statistics compiled by the FSO as of the beginning of 1993, the information necessary for the estimation of the f.o.b. value of imported goods is no longer available. Therefore, 1992 relations have been assumed to be constant and have been applied to current figures since 1993. The ratios are broken down by mode of supply and by country.

4.2.2 FOR SERVICES
Monthly survey results on travel expenditure are only available with a delay of five months. For that reason, provisional figures are estimated using an ARIMA estimate.

Financial services are included in the services item of the b.o.p. They are disseminated separately. For further information, please see Sub-section 8.3.

4.2.3 FOR INVESTMENT INCOME
See Sub-section 5.6.

4.2.4 FOR DIRECT INVESTMENT
See Sub-section 7.6.

4.2.5 FOR PORTFOLIO INVESTMENT
See Sub-section 8.6.

4.2.6 FOR FINANCIAL DERIVATIVES
There are no estimates in the field of financial derivatives.

4.2.7 FOR OTHER INVESTMENT
See Sub-section 10.6.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
Part of the general reporting system (see Sub-section 3.2).

Dividends are recorded as of the date they are paid.

Methodological changes causing breaks do not occur for data from 1994 onwards; a
geographical breakdown for these historical time series is available.

A bias towards the under-recording of credits in the income account can also be observed for Germany, therefore the reported data are supplemented by estimations.

5.1.2 INCOME ON DIRECT INVESTMENT
In the case of direct investment income, total annual earnings are derived from balance sheet information. Distributed earnings are based on settlement data. The figures on reinvested earnings are estimated on an annual basis and allocated to months pro rata temporis. These figures are revised once a year according to the results of the annual survey on balance sheet data. Since the survey on balance sheet data provides information on profits on an all inclusive basis only (current operating profits and extraordinary profits), extraordinary profits/losses are estimated on a case-by-case basis (i.e. if very large profits or losses are reported) and excluded from the total annual surplus. For this purpose, publicly available balance sheet information is used or reporting enterprises are contacted directly.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
In the case of portfolio and other investment income, the reported settlement data are supplemented by estimated figures; in these areas, in particular, the increasing complexity of cross-border transactions hampers the correct compilation of income payments and increases the degree of statistical uncertainty.

For income of collective investment institutions (CIIs), all income raised as a result of investments made by the CIIs (i.e. on their assets side), regardless of the financial instrument, is attributed to the holders of the units of the CIIs. According to the SNA and the ESA, these units are treated as “shares and other equity” in the b.o.p. Therefore, the amount and the time of the recording of the income on the assets side determine the amount and the time of the recording of the income on the liabilities side. The income is assigned to the investors regardless of whether it is distributed or not.

Accrued interest is taken into account to the extent that coupon payments are reduced if the receiver has not held the security for the whole coupon period.

The geographical allocation of income on foreign securities is based on the debtor principle, i.e. allocation is according to the country of issuer. In the case of income paid to non-residents on domestic securities, debits are allocated according to the residency of the first known counterpart.

5.1.4 INCOME ON OTHER INVESTMENT
See Sub-section 5.1.3.

Data on income on reserve assets are taken from the accounting system of the Deutsche Bundesbank.

5.2 DEFINITIONS
The definitions are, in principle, in accordance with the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
The accruals principle is not followed for all items and only with regard to the income figures. Payments for income on trade credits are reported only in very rare cases; no estimations are made.

5.4 GAPS
See Sub-sections 5.1 and 5.3.

5.5 INTENDED HARMONISATION
The survey on balance sheet data has been expanded to provide separate information on current operating profits and extraordinary profits as of the reporting year 2004. The current operating performance concept will
therefore be fully adhered to as of 2006 when the first data of the expanded survey will become available.

Implementation of accruals recording for portfolio investment income is planned. Accruals would be estimated on an aggregate basis.

5.6 ESTIMATION METHODS

Income data are reported on a settlement basis. In cases where these data are not plausible and where there are doubts concerning the reliability of reports, estimates are made. Estimated figures are derived from stock data and information on interest rates.

A breakdown of investment income into its sub-components (direct investment, portfolio investment and other investment income), as required for quarterly figures, is also available for monthly data.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2).

The revenues resulting from the sale of UMTS licences are to be treated in the b.o.p. as sales of non-produced non-financial assets. According to the BPM5, these are to be recorded in the capital account. This implies that there is no impact upon the current account. The counterpart of this recording is to be found in the financial account.

6.2 DEFINITION

In principle, the definition of the capital account is in accordance with the recommendations set out in the BPM5 and the harmonisation proposals made by the former Task Force on Financial Flows and Stocks.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

It is not possible to receive any information on migrants’ transfers. The acquisition/disposal of non-produced non-financial assets (patents, copyrights) cannot be separated from fees for licences, patents or copyrights in the current account. However, in cases where significant individual transactions are involved, these are shown in the capital account rather than in the current account.

6.5 INTENDED HARMONISATION

None.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2). In particular, use is made of reported transactions for equity capital, monthly stock statistics of affiliated companies for inter-company loans and annual balance sheet statistics on direct investment enterprises in the reporting country and abroad.

Data from 1996 onwards are not distorted by breaks resulting from methodological changes, except in the case of securities lending between affiliated companies.

The geographical breakdown is based on the debtor/creditor principle and is also available for historical data. However, if ownership of a resident direct investment enterprise is transferred from one non-resident direct investor to another, this transfer is not always reflected in the b.o.p. figures.

Transactions settled via an exchange of shares are recorded when the exchange takes place.
The valuation is based on stock exchange-quoted prices if the company is listed, and otherwise on book values.

7.2 DEFINITION

The definition complies in principle with the recommendations set out in the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics (WG-BP&ER). Special purpose entities are regarded as direct investment enterprises. Furthermore, all cross-border transactions in real estate are covered.

Equity contributions without payment (i.e. providing real assets or financial assets) have to be reported.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

All long-term and short-term loans between affiliates are included. In some cases, however, short-term credits are treated according to the assets/liabilities principle instead of the directional principle (for example, in the case of indirect participation and double-status enterprises). Transactions in securities between affiliates are not included here, but are recorded under portfolio investment.

7.4 GAPS

None.

7.5 INTENDED HARMONISATION

None.

7.6 ESTIMATION METHODS

Reinvested earnings are estimated for current periods and, in general, to produce monthly and quarterly figures (see Sub-section 5.1.2). There are no other estimations for direct investment.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Sub-section 3.2). The main data sources are:

(i) reports from Monetary Financial Institutions (MFIs) on transactions executed on their own behalf and on behalf of their clients, which are indistinguishable; and

(ii) reports from other institutions on transactions executed on their own behalf which involve either the purchase or sale of securities directly from or to a foreign counterpart.

Reporting agents use the securities database of the national numbering agency (Wertpapier-Mitteilungen) to report portfolio transactions on a security-by-security basis.

Breaks in historical time series may occur as a result of the recording of securities lending. Prior to 1999 securities lending was treated as a sale or purchase of the underlying security, with the counter-entry of claims or liabilities for the security to be returned included in other investment.

The geographical allocation of foreign securities (Residents’ assets) is based on the debtor principle, i.e. allocation is made according to the country of issuer. In the case of domestic securities, transactions are allocated according to the residency of the first known counterpart. The same breakdown is available for historical data.

8.2 DEFINITION

In principle, the definition complies with the recommendations of the BPM5 and the harmonisation proposals made by the former Task Force on Financial Flows and Stocks.
Transactions related to trade in loans are included in other investment.

8.3 Deviations from agreed definitions

In general, the transaction volume, fees and commissions as well as the accrued interest are reported as a lump sum in one figure. The investment income account partly follows the accruals principle, but no offsetting entry is added to the financial account. Transactions in securities issued by affiliates are included. Transactions in German *Schuldscheine* (see Sub-section 3.8.4 on “Borderline cases”) are not included in portfolio investment, but rather are classified as loans under other investment in line with the treatment in money and banking statistics.

8.4 Gaps

There is considerable difficulty in capturing portfolio investment abroad, which is carried out directly by private households via foreign banks.

8.5 Intended harmonisation

None.

8.6 Estimation methods

Portfolio investment transactions are compiled within the framework of the general reporting system. Banking statistics are used to calculate the sectoral breakdown for MFIs’ transactions in foreign securities, using the change in stocks. Large exchange rate and price effects are taken into account. Annual statistics from custodians are used for cross-checking purposes.

Some estimations are made for resident private households’ monthly transactions in securities via non-resident banks, since most private persons do not report those transactions.

Cross-border coupon payments on domestic securities are reduced in cases where the non-resident holder holds the security only for part of the coupon period (and vice versa for foreign securities and domestic holders).

9 Financial derivatives

9.1 Specific features of data collection

Payments are reported in the same way as for other instruments; there is no special collection system for derivatives. The following instruments can be identified separately: futures, warrants, traded options, over-the-counter (OTC) options and interest rate swaps. Premia for options and margin payments are recorded as transactions in derivatives.

The residency of the counterparts is, in general, identified via the clearing house. OTC-traded financial derivatives are geographically allocated according to the residency of the (non-resident) counterpart.

9.2 Definitions

In principle, the definition complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the former Task Force on Financial Flows and Stocks. Interest rate derivatives are recorded correctly under financial derivatives.

9.3 Deviations from agreed definitions

None.

9.4 Gaps

No sectoral breakdown is available at present.

9.5 Intended harmonisation

None.

9.6 Estimation methods

None.
10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2). In addition, BIS data are used as “counterpart” information to identify assets held with foreign banks which were not reported directly by residents. Short-term transactions are derived from changes in stocks, eliminating effects of exchange rate changes and statistical breaks.

Prior to 1999 securities lending was treated as a sale or purchase of the underlying security, with the counter-entry of claims or liabilities for the security to be returned included in other investment.

Stock data on trade credits are reported on a monthly basis as part of the general reporting system. The transactions relevant to the b.o.p. are derived from the changes in these stocks.

The geographical breakdown distinguishing euro area and non-euro area flows is also possible for historical data.

10.2 DEFINITION

In principle, the definition complies with the recommendation set out in the BPM5.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

German Schuldscheine are classified as loans under other investment in line with the treatment in money and banking statistics (see also Sub-section 8.3).

10.4 GAPS

Transactions via private accounts held abroad are difficult to capture statistically.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

Deposits of resident non-MFIs with foreign MFIs are estimated on the basis of BIS statistics; there are no other monthly estimates in the field of other investment.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on reserve assets are taken from the accounts of the Deutsche Bundesbank and are thus provided by its Accounting Division and its Payments System Division, which acts as a back office settling market operations.

11.2 DEFINITION

The definition complies with the recommendations set out in the BPM5.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Germany’s i.i.p. is compiled mainly on the basis of several stock statistics. The main data sources are:

- the monthly stock statistics on the external assets and liabilities of domestic MFIs and of domestic enterprises, households and general government arising from financial operations and trade credits; and
the annual statistics on international capital links, which are used for foreign direct investment.

These sources allow a sectoral classification between the monetary authority, MFI, enterprise (including households) and general government sectors.

Modified accumulated flows are mainly used for compiling the portfolio investment positions. The results are cross-checked with information from MFIs’ balance sheets and the Deutsche Bundesbank’s custodian statistics. Assets relating to money market instruments are compiled using real stocks from the monthly stock statistics. The same applies for the portfolio investment assets of the MFI sector.

In order to estimate market values for portfolio investment positions, b.o.p. transactions during the reporting period are converted into nominal transactions and added to the nominal stocks of the previous reporting date. The conversion is performed using average market prices and exchange rates for individual countries/regions, instruments and sectors. Finally, the new nominal stocks are converted into market values using the market prices and exchange rates as at the reporting date.

It is not possible to allocate holding gains precisely to MFIs, enterprises and households, since no specific information is available on the valuation used in the balance sheets. Consequently, price fluctuations are most likely to be reflected statistically in the non-banking sector.

**12.2 DEFINITIONS**

**12.2.1 GENERAL**

Germany’s external assets and liabilities are presented according to the broad classification of the BPM5.

**12.2.2 DIRECT INVESTMENT**

The main data source for compiling the direct investment positions is balance sheet data on foreign and domestic direct investment enterprises from the Deutsche Bundesbank’s annual statistics on international capital links. However, since the results of this annual survey are available only with a time-lag of 15-18 months after the end of the reporting date, preliminary FDI positions have to be compiled from:

- accumulated flows in the case of “equity capital”;
- monthly stock statistics on the external assets and liabilities of domestic enterprises, which distinguish between loans between affiliated and non-affiliated enterprises, in the case of “other capital”.

Both components, i.e. “equity capital” and “other capital”, have to be revised when the annual statistics on international capital links become available due to the greater detail and accuracy of this data source. With regard to “other capital”, the revisions not only affect the stock of inter-company loans, but also imply changes in the stock of “other investment”. This is because only the distribution of loans between affiliates and non-affiliates should change, not the overall amount of loans.

Investment capital is entered in the i.i.p. at book values, which are derived from the balance sheets of direct investment enterprises (subsidiaries or associates) and not from the investors’ balance sheets. In order to make comparisons easier, book values are used even in cases where participating interests have been traded on stock exchanges and market prices would therefore be available.

The Deutsche Bundesbank’s annual statistics on international capital links are broadly in line with the directional principle and cover the equity capital which German direct investors hold in foreign direct investment enterprises; the same applies to loans granted by German shareholders and other affiliated enterprises in Germany to the foreign investment enterprises. Finally, the loans which are granted by foreign
investment enterprises to the German shareholders and which are to be booked as reduction of German external assets are surveyed. Both equity capital and the credit relationships between foreign direct investors and domestic direct investment enterprises are shown, in principle, in the same way.

Nevertheless, the way in which credit relationships are shown in the statistics on international capital links does not provide any information on the types of loan (trade or financial credits); nor does it make any distinction in terms of maturity.

**Real estate**

In compliance with the guidelines set out in the BPM5, claims arising from the acquisition of real estate abroad are shown as financial assets. Accordingly, real estate held by non-residents is regarded as a domestic asset of a notional unit which is accompanied by a domestic liability to the foreign investor. Both private and commercial real estate are shown under direct investment.

Stock data on real estate are accumulated from flows, taking into account price changes and exchange rate changes. Owing to gaps in the available price data and the aggregate method which must be used, however, the figures are subject to certain margins of error.

### 12.2.3 PORTFOLIO INVESTMENT

The definitions are in accordance with the BPM5.

(i) **Bonds and notes**

Securities, as defined here, include bonds, notes and similar debt securities with an original maturity of more than one year. The stock data are derived from the modified accumulation of b.o.p. transactions (see Section 12.1).

(ii) **Money market instruments**

Short-term bonds, i.e. all debt securities with an original maturity of up to one year, are recorded as money market instruments. This includes short-term public issues (such as “Bubills”) as well as commercial paper and certificates of deposit. While assets are collected as real stocks, liabilities are compiled by modified accumulation of flows (see Section 12.1). Market valuation is not applied for short-term debt securities.

(iii) **Investment fund certificates**

Stocks of foreign and domestic investment funds are calculated by modified accumulation of flows (see Section 12.1).

(iv) **Equities**

Holdings of equities shown under portfolio investment are derived from the modified accumulation of flows (see Section 12.1).

### 12.2.4 FINANCIAL DERIVATIVES

No stock data in accordance with the BPM5 definition are available. Although it is possible to capture the transactions relatively well as genuine payments using the current reporting system, there is still no primary statistical recording of stock data on the grounds that neither the banking statistics nor corporate statistics provide sufficient information on asset or liability positions corresponding to valuation at market prices. In particular, the statistical coverage of these data is hampered by the present accounting rules for MFIs and enterprises, which do not require appropriate statements in the balance sheet.

Previous surveys for other purposes did not aim at differentiating between market participants according to their country of residence, which is necessary for the i.i.p. For that reason, it is not possible to compile i.i.p. data for financial derivatives for the time being.

### 12.2.5 OTHER INVESTMENT

The definitions are in accordance with the BPM5.

The category “other investment” takes into account information from three main data
12.2.6 Reserve Assets
The definitions are in accordance with the BPM5.

12.3 Deviations from Agreed Definitions
None.

12.4 Gaps
With regard to portfolio investment, the globalisation of the securities business has hampered the recording of the securities components of the b.o.p. statistics. Transactions by private investors cannot always be compiled with the desired degree of accuracy. Since the business transacted by residents abroad is not fully reported, the foreign securities (assets) held by residents, as shown in the data, are probably not sufficiently covered. On the other hand, the holdings of German securities ascribed to non-residents (liabilities) are possibly distorted because sometimes foreign purchases also include orders placed by residents abroad. Estimates for closing these gaps, based on stock information available from MFIs’ balance sheets and securities deposit statistics, are still subject to considerable uncertainty.

In the case of direct investment, reverse investment by companies which are direct investors as well as direct investment companies is difficult to capture. There is no reporting scheme for inter-company loans for MFIs.

12.5 Intended Harmonisation
In line with the agreement of the WG-BP&ER, it is planned to introduce market valuation for direct investment enterprises which are listed companies.

12.6 Estimation Methods
None.

13 Administration

13.1 Titles of Publications
Regular publications related to the b.o.p. are:

Monthly Current Account – main items, preliminary, available six to seven weeks after the reporting period: “Pressemitteilung des Statistischen Bundesamtes über die Entwicklung des Außenhandels”;

Monthly balance of payments – main items, preliminary, available six to seven weeks after the reporting period: “Pressemitteilung der Deutschen Bundesbank”;

Monthly balance of payments – main items and sub-items, preliminary, available seven to eight weeks after the reporting period: “Monatsberichte der Deutschen Bundesbank”, “Statistische Beihefte zu den Monatsberichten der Deutschen Bundesbank, Reihe 3, Zahlungsbilanzstatistik” (headings and explanatory notes available in English);

Annual balance of payments – including a geographical breakdown for the previous three years, available in July of the following year: “Zahlungsbilanz nach Regionen, Statistische Sonderveröffentlichung 11” (also available in English in August).
13.2 CONTRIBUTORS

This country information was drafted by the External Statistics Division of the ECB and subsequently amended and agreed with the Deutsche Bundesbank. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Germany should be addressed to:

2  INSTITUTIONAL ASPECTS

2.1  INTRODUCTION

According to the Law on the Central Bank of the Republic of Estonia, Eesti Pank is the only agency responsible – as a fully independent institution – for the compilation of the balance of payments (b.o.p.) and the international investment position (i.i.p.). The first comprehensive statement of the Estonian b.o.p. was published by Eesti Pank in November 1992 and contained data for nine months. The first i.i.p. was compiled on a quarterly basis in 1996. The compilation system combines banking settlement reports, direct surveys of economic agents and administrative data. Data is collected for statistical purposes only; no foreign exchange control is practised in Estonia. The b.o.p. accounts are compiled according to the principles outlined in the 5th edition of the IMF Balance of Payments Manual (BPM5).

2.2  LEGISLATIVE PROVISIONS

According to the LCB (Sections 2 and 34), the central bank shall be entitled to obtain, free of charge, all data necessary for compiling the b.o.p. from any state or municipal entity or from any other legal entity engaged in foreign economic operations and located within the Republic of Estonia.

The OSA defines the Bank of Estonia as an agency conducting official statistical surveys in the field of b.o.p. statistics (Section 4). It stipulates the duties (Section 5), the obligation to submit data collected through official statistical surveys (Section 7), the data protection and confidentiality requirements (Section 8), and the liability of respondents to comply with the requirements laid down (penalty for non-compliance) (Section 10).

Based on the above-mentioned legal mandates, the Governor of Eesti Pank has issued regulations on the balance of payments reporting procedure for credit institutions (Decree No 21 of 16 December 2002) and has also issued decrees by which various survey forms have been established.

In addition, the Law on Credit Institutions of 2 February 1999 sets the overall statistical obligation for resident commercial banks (Section 91). The collection of foreign trade data is based on the Estonian Customs Law of 19 January 1998.

2.3  INTERNAL ORGANISATION

At Eesti Pank, statistical data are compiled by the Balance of Payments and Economic Statistics Department (BOPD). The BOPD is also responsible for compiling the i.i.p. and other statistical statements relating to the external sector (direct investment reports, external debt statements, the template of external reserves and foreign currency liquidity, etc.).

The BOPD itself collects most of the data directly from data providers using surveys, the International Transactions Reporting System (ITRS) and administrative data. Its main inter-agency partners are the Financial Stability Department and the Central Accounting Department, which provide initial data for external sector statistics on the banking and monetary authority sector.

In the BOPD there are 14 people directly involved in the collection, control and processing of data as well as in output compilation. According to the nature of the working process, the BOPD is divided into three groups (as shown in the organisational chart of the BOPD):

- the Direct Reporting Group (six people) – responsible for data collection and processing via questionnaires and for creating and updating the enterprise sample
as well as for dealing with data collection and processing with banking settlements and quality checks of the data;
- the Methodology and Analyses Group (five people) – four economists are responsible for methodological issues relating to the data collection system design and data management, while an econometrician is responsible for methodological issues relating to statistics and to the modelling of monthly b.o.p. key items;
- the IT, Data Management and Dissemination Group – three people: manager of IT software and hardware systems and two data managers responsible for data warehouses, output files and dissemination; and
- the Head and Deputy Head of the BOPD are responsible for the general coordination of the work.

In addition to the compilation of the b.o.p., the BOPD is responsible for the exchange of general economic statistics between Eesti Pank, the ECB and the State Statistical Office of Estonia (SSO).

There is close cooperation between the above-mentioned sections. Final BOPD products are the result of teamwork.

Regular descriptive data analysis is carried out by the BOPD. The Economic Policy Division of the Central Bank Policy Department examines external sector accounts in the context of overall macroeconomic performance.

2.4 EXTERNAL COOPERATION

For the purposes of b.o.p. statistics, Eesti Pank cooperates with other authorities in Estonia. An important partner is the SSO, both as a provider and as a user of data on the external sector. On one hand, foreign trade statistics provided by the SSO are used as the basis for the goods accounts; on the other hand, the b.o.p. is part of the national accounts compiled by the SSO in line with the System of National Accounts of 1993 (SNA 93).

Eesti Pank maintains regular contacts with other institutions: the State Tourism Board, the Customs Board, the Ministry of Finance, the Ministry of Foreign Affairs, the Central Business Register and the Central Register of Securities as well as to credit institutions and major companies as the main data providers.

In order to provide adequate travel statistics, a regular border sampling survey has been vital. For this purpose, market research and polling institutes have been involved.

Close and regular cooperation is maintained with other providers of statistics: the Bank of Finland, Bank of Latvia, Bank of Lithuania, National Bank of Russia and Statistics New Zealand and Ireland (data comparison, joint seminars, cooperation in software development, etc.).

2.5 USERS

Eesti Pank is responsible both for dissemination all related statistics to the public and for informing international organisations.

The main internal users are the Central Bank Policy Department and the Research Department. The SSO uses b.o.p. data for the rest of the world account in the national account statistics. Other important external users are the Estonian Government, government ministries, research institutes and universities, credit institutions, international rating and auditing agencies, the World Bank, the European Bank for Reconstruction and Development (EBRD), etc.

B.o.p. and i.i.p. data, broken down into standard components, are supplied to international organisations such as the IMF, the ECB and the European Commission (Eurostat).
3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The BOPD collects most of the data directly from data providers, using mixed (dual) b.o.p. compilation systems, namely surveys and the ITRS. Data are supplemented with information from various sources and with estimates.

The survey system has been the main source of information for the compilation of the quarterly b.o.p. and i.i.p. since the BOPD was established in 1992. The BOPD is responsible for all procedures related to the conduct of surveys, for keeping direct contact with respondents and for having input data on an individual company level. The main cornerstones of survey design are the following: to keep surveys close to accounting standards and as simple as possible so as to facilitate and ensure a high rate of response. At present, there are eight different survey forms, which have been specifically designed for enterprises engaged in various economic activities and which are sent to 3,300 respondents every quarter (to around 4,000 reporters in first quarter of the year). Statistical sampling techniques are not in use because of the small size of the economy and the lack of statistical regularity. The enterprise sample is currently being updated, with the process based mainly on various other sources of information as mentioned below. The main obstacle to the use of monthly surveys is a high reporting burden and a non-concentrated economy (a large number of “small players”, while the “big players” vary from period to period).

The ITRS was introduced in 1994 as a “partly open reporting system” with transaction-by-transaction reporting covering banks’ settlements according to the debit and credit turnover of nostro, vostro and non-residents’ accounts. Transactions made by companies via an account abroad are not reported. Given the limits of settlement data (no accrual flows, etc.), the ITRS is used mainly as a supplementary data source for the quarterly b.o.p. Thanks to the speed of the ITRS data collection system, settlements are essential input for estimating and modelling monthly key b.o.p. items.

Other main inter-agency data sources, in addition to the two statistical systems mentioned above, are the internal databases maintained by the Financial Stability Department and the Central Accounting Department, which provide initial data relating to external sector statistics on banking and the monetary authority sector.

Important data sources outside Eesti Pank are as follows:

- the SSO – provides monthly external trade statistics;
- the Central Business Register – provides monthly updates on the register of legal entities, their owners and main audited annual economic indicators;
- the Central Register of Securities – provides access to the official securities register, which comprises of relevant information on portfolio investments;
- other institutions: the State Treasury, the Ministry of Finance, the Ministry of Foreign Affairs, the Estonian Authors’ Society (EAU), Estonian Tourist Board; and
- the media: press, internet, registers of licences, etc.

Breakdowns by country and currency are only provided by the ITRS and the banking statistics database; the survey system offers a country breakdown for services as well as a breakdown by country and activity for foreign direct investment.

3.2 REPORTING AGENTS

- Monetary authorities: Eesti Pank’s Central Accounting Department provides the BOPD with data on the official reserve assets as well as the other transactions and stocks related to the activity of the central bank. Data are supplied according to the framework jointly developed by the BOPD,

the Central Accounting Department and the Foreign Exchange Department.

– **Banking Sector:** Eesti Pank’s Banking Statistics Division in the Financial Stability Department supplies the BOPD with data on the credit institutions’ external activities through multi-user data warehouses. Banks report data to this Department (via the Financial Supervision Authority) for statistical and supervisory purposes, taking into account the interest in compiling external sector statistics. All reports have been worked out multilaterally, taking into account the principles of consistency and cross-checking.

In addition to reporting, credit institutions are responsible for ITRS data collection and transmission to the BOPD on transactions of banks’ clients. Banks are obliged to enable resident clients to declare their incoming and outgoing international payments.

A credit institution is defined as a private legal entity that has the right to receive deposits of money or other repayable funds from the general public and to grant credits on its own account. Credit institutions can carry out the following transactions: accept deposits and other repayable funds from the general public, grant loans, conduct credit transactions, carry out financial leasing, execute payment transfers, issue and administer non-cash means of payment, guarantee transactions, trade in securities both for their own account and for customers’ accounts, be involved in organising securities’ issues and provide related services as well as advise customers on economic issues, financial mediation activities, depository transactions and other similar transactions.

– **General government sector:** the various ministries and government departments supply information on their external transactions and positions. The most important are the Ministry of Finance, the Ministry of Foreign Affairs, the State Migration Fund, the Estonian Authors’ Society, the State Privatisation Agency, etc.

– **Other sectors:** besides the ITRS, the type of survey form issued to a company depends on the type of company being surveyed. Currently, eight different survey forms are used.

The names of the reports are presented in Table 1.

Accounting principles are taken into account when developing all the surveys used. The main information provided by the reporting forms are data on foreign assets and liabilities as well as income statements related to transactions with non-residents. Surveys are carried out quarterly and submitted to Eesti Pank within 20 days after the end of the reference period. The rate of response has been high at around 90%.

### 3.3 Thresholds

With respect to the b.o.p., a general statistical reporting threshold of EEK 100,000 (approximately €6,400) is currently applied in the ITRS to transactions involving all economic agents (i.e. exemption threshold). Only bank’s client transactions over EEK 200,000 (approximately €12,700) must be declared (the payment code and residency of the counterparty) (i.e. simplification threshold).

The information is collected through the turnovers of banks’ nostro and vostro accounts and non-residents’ accounts in Estonia. In the case of nostro- and vostro accounts the reporting threshold is a declaration threshold which means that all transactions above the threshold must be reported with detail. Reporting is fully automatic by credit institutions.

The declaration obligation does not cover the domestic transactions between residents and non-residents made via non-residents’ accounts.
3.4 AVAILABILITY OF DATA

The b.o.p. is compiled on a monthly and a quarterly basis, the i.i.p. on a quarterly basis. Data are disseminated, in accordance both with the advance release calendar and the guidelines of the Special Data Dissemination Standard (SDDS) of the IMF and with the requirements of the ECB (quarterly data no later than three months after the end of the reference period, monthly data no later than six weeks after the reference month).

Data are published according to the standard structure (including instruments) of the b.o.p. and i.i.p., as recommended in the BPM5 and by the ECB. Not doing so would give rise to the problem of confidentiality. Quarterly data sets for the b.o.p. have been available since 1992, while monthly data have been available since 1999 and those for the i.i.p. and external debt have been available since 1996.

Since 2003 geographical breakdowns have been available for all b.o.p. and i.i.p. accounts. Statistics broken down by currency are not compiled.

Since January 2002, the monthly b.o.p. key items are published regularly within six weeks of the end of the reference period. Monthly data series are available since 1999. No geographical breakdown is compiled.

3.5 DATA CONTROLS

Control procedures are aimed at obtaining the highest reliability ratio. With the exception of built-in computerised controls (data processing errors, inconsistencies, etc.), systematic quality controls are carried out. Surveys, ITRS items and other information sources (securities register, business register, other statistics, media) enable complementary information to be derived for cross-checks, logical controls and in-depth analyses to pick out possible inaccuracies and inconsistencies in reported initial data as well as checks at an aggregated level.

Quality controls at a lower level start with checks of each individual report (surveys, ITRS items) for completeness and plausibility as well as checks whether surveys and ITRS transactions correspond. Supplementary information for comparison is received from the business register, the securities register and the media. If necessary, the staff contacts the reporting agents in order to clarify any doubtful details. All relevant changes or transactions are confirmed.

Quality controls at an aggregated level include controls of the general consistency of the whole b.o.p. and i.i.p. as well as consistency checks at a macroeconomic level. Particular attention is paid to the monitoring of errors and omissions.

3.6 REVISION POLICY

− Regular revisions: revisions of the provisional quarterly figures for the current year are published together with the provisional data for the following quarter. Revised annual data for the year before the reference year are published together with the provisional data for the fourth quarter of the reference year. Revised annual data for the reference year are published together with the provisional data for the first quarter of the next year. In this case data can be considered final. Monthly data are revised when the quarterly b.o.p. is compiled or revised.

− Extraordinary revisions: in some cases, if the need arises, extraordinary revisions are made although data have been considered final. Revisions of a more historical nature may also be made if there is an important methodological change to be incorporated.

A revision policy for the monthly key items is not in place.

3.7 DISSEMINATION

Data are published according to the framework of the IMF’s SDDS requirements.
The data are released simultaneously to all interested parties by issuing an appropriate press release, namely “Eesti Pank Newsletter: Estonia’s Balance of Payments” and “Eesti Pank Newsletter: International Investment Position and External Debt”, which is also posted on the bank’s website. Both press releases, which contain expanded analyses and tables, are regularly published in Eesti Pank’s Quarterly Bulletin “Preliminary Balance of Payments of Estonia”. The monthly b.o.p. data with short notes, the data template of Foreign Currency Reserves/Foreign Currency Liquidity and External Debt are available on Eesti Pank’s website.

All data, as well as a one-year calendar containing the dates on which press releases are to be issued, are published on Eesti Pank’s website (http://www.bankofestonia.info). The content of disseminated external sector statistics is as follows:

- Quarterly b.o.p. (long and short versions in EEK, EUR and USD)
- Monthly b.o.p. (in EEK, EUR and USD)
- Analyses (bulletins)
- Current account by year as a percentage of GDP
- Current account by quarter as a percentage of GDP
- Foreign direct investment by year
- Foreign direct investment by quarter
- Direct investment flows by country
- Direct investment flows by field of activity

**International Investment Position and External Debt**
- I.i.p. (long and short versions in EEK, EUR and USD)
- Newsletters (press releases)
- Direct investment stock by country
- Direct investment stocks by field of activity

**Data Template on International Reserves/Foreign Currency Liquidity**
- Gross External Debt (in EEK, EUR and USD)

**Advance Release Calendar**

---

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

The main source for data on trade in goods is customs statistics collected by the customs authorities, processed by the SSO and passed on to Eesti Pank on a monthly basis. The special trade method is used.

4.2 DEFINITION

Data on trade in goods are compliant with BPM5 standards. Data are not available on a transactions basis. They are broken down by commodity (up to ten-digit commodity codes) and by country. The imports are broken down by country of consignment (data by country of origin are also available but not published).

Exports and imports are valued on an f.o.b. basis. Until 2004, imports were adjusted to an f.o.b. basis, using an average adjustment factor of currently 5% of the c.i.f. value. The information for this adjustment was derived from questionnaires drawn up by the BOPD. Since 2004, special transportation and insurance cost rates have been used for imports from each country. These rates are based on a special investigation of customs data.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

No deviations from BPM5 standards. Detailed information (by commodity and country) is available from customs’ statistics on goods for processing, repairs and leasing.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

Eesti Pank makes adjustments to the foreign trade data issued by the SSO to reflect b.o.p. concepts. Information on these transactions is obtained from the questionnaires sent out to transportation companies. Adjustments are made for goods purchased abroad (e.g. fuel, lubricants, etc. for transportation vehicles) and...

1) Data is compiled but disseminated in 2005.
for repairs of capital goods. Information on these items is also obtained from the transportation company surveys, and the relevant amounts are added to the SSO import total. In addition, an estimate is made for unidentified imports, which are becoming increasingly less significant. This adjustment is based on information provided by the customs authorities, in the “Exhaustiveness Report” published by the SSO, and by other sources.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Coverage of services corresponds to the requirements set out in the BPM5. Data collection for services is part of the general reporting system. There are also some additional sources in the case of travel and government services. For travel services, the regular sample survey of different groups of visitors is carried out on a regular basis as a joint project of Eesti Pank, the SSO, the Estonian Tourist Board and market researchers.

5.2 DEFINITION

Definitions and concepts used for services are in line with the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

No major deviations.

5.4 GAPS

None.

5.5 INTENDED HARMONISATION

None.

5.6 ESTIMATION METHODS

A statistical model based on border crossing statistics and the results of the sample survey is used to calculate expenses of visitors in the country of destination. In the monthly b.o.p. services item, expenses other than those on travel are estimated using six different statistical models where the inputs are based on all available data, the ITRS and other indirect indicators.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES

Compensation of employees comprises wages, salaries and other benefits earned in less than one year by individuals in economies other than those in which they are resident. Included are border workers who have centres of economic interest in their own economies, irrespective of their length of stay, and earnings of local staff employed by foreign diplomatic missions. Income is recorded on a gross basis, before the deduction of income tax.

The main data sources are enterprise surveys, the ITRS and other administrative statistics.

6.1.2 INCOME ON DIRECT INVESTMENT

Income on direct investment is income on equity and income on debt related to direct investors or affiliated or associated subsidiaries. The direct investment credit entry represents income earned from direct investment enterprises abroad. The direct investment debit entry represents income earned by non-resident direct investors from their Estonian direct investment enterprises.

Separate data are provided for income on equity and income on debt. Income on equity is further divided into “dividends and distributed branch profit” and “reinvested earnings and undistributed branch profit”.

Until 2003, a country breakdown was only available in the area of reinvested earnings on a

1 Regular report coordinated by the European Commission (Eurostat).
quarterly basis. As from 2003, both country and activity breakdowns are available for all items of direct investment income. The main source of data on reinvested earnings is the quarterly enterprise survey on the direct investment activities performed abroad by residents and in Estonia by non-residents. The offsetting entry for reinvested earnings is recorded under direct investment in the financial account.

Income on inter-company loans is recorded as income on direct investment and is derived from the quarterly enterprise survey on inter-company loans. Until now Estonia has not income on debt securities between affiliates. If such a need arises, transactions will be recorded as income on direct investment debt and will be reported in the questionnaire. If income is calculated on an accruals basis, the offsetting entry will appear under direct investment and reinvested earnings in the financial account.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
Separate data are provided for income on equity (dividends) and income on debt. In portfolio investment income, dividends are attributed to the period in which they are declared payable. Interest income is accrued in the period in which it is earned.

A sectoral breakdown by main economic sector is available by instrument and by country, but not by currency.

Coverage of dividends is satisfactory. The main data source is the enterprise survey and the supplementary source is the ITRS. Statistics on income for collective investment institution funds are covered by special questionnaires.

In the case of bonds and notes, as well as money market instruments, income is recorded on an accruals basis and the data are available quarterly. Income on discounted securities is also recorded on an accruals basis. The accrued interest is equal to the difference between the acquisition price and the nominal value of the instrument, which is distributed to the reporting period on a pro rata basis.

6.1.4 INCOME ON OTHER INVESTMENT
Income on other investment covers interest receipts and payments on all other resident assets and liabilities vis-à-vis non-residents. It includes households’ imputed income from net equity in life insurance reserves and pension funds.

Income on loans, deposits and reserve assets is recorded on an accruals basis. Income on trade credits is covered by enterprise surveys and the ITRS. The data source for income on reserve assets is an income statement from Eesti Pank, which is available on a monthly basis.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
None.

6.3 GAPS
Data availability on income on households’ foreign assets is poor.

6.4 INTENDED HARMONISATION
The intention is to create assessment methods for households’ income credits.

6.5 ESTIMATION METHODS
Up to now there have been no estimation methods in this field in case of the quarterly b.o.p. Monthly estimated data are based on the income calculated on the stock position of the last year by using estimated annual income rates.

7 CURRENT TRANSFERS
See Sub-section 8 on the capital account. As data on foreign assistance is available only on an annual basis, quarterly estimates are used, adjusted at the end of the year.
8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Data collection is part of the general reporting system (see Sub-section 3.2). Data are mainly covered by the ITRS. Data on funds paid out to emigrants leaving Estonia are also reported by the State Migration Fund. The Ministry of Finance supplies data on public sector transfers.

8.2 DEFINITION

The definition of the capital account is in line with the definitions set out in the BPM5. The distinction between capital and current transfers is made taking into account the transaction code and all other details of payments. Current transfers directly affect the level of disposable income and consumption; the capital account covers transfers of fixed assets or debt forgiveness.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

No deviations.

8.4 GAPS

No significant gaps.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Direct investment is understood as any investment undertaken by a resident of one economy in a resident enterprise of another economy, with the objective of obtaining or sustaining a lasting interest in the enterprise and exercising a significant degree of influence in its management. A direct investment relationship is deemed to exist between two enterprises or individuals and enterprises as well as international organisations and enterprises when one has an equity interest of at least 10% in the other. All transactions between direct investors and enterprises and among affiliated enterprises are recorded as direct investment flows. In the case of banks and other financial intermediaries in a direct investment relationship, only equity transactions and permanent debt are included under direct investment. Reverse equity investment is not allowed in Estonia.

A distinction is made between equity capital, reinvested earnings and other capital. The directional principle has been implemented for all transactions involving direct investment.

The collection of direct investment data is part of the general reporting system. Information on direct investment is obtained from the following sources:

- the Estonian Business Register provides data on the registered owner’s equity holdings in established companies as well as changes in registered ownership;
- Eesti Pank’s enterprise survey provides data on direct investment stocks and flows to operating enterprises;
- Eesti Pank’s Financial Stability Department supplies statistics on foreign direct investment by commercial banks; and
- the Central Register of Securities provides data on transactions and stocks of listed or registered companies.

The sectoral breakdown is geared to the resident economic sector, i.e. the investing sector for outward flows and the receiving sector for inward flows. All direct investment flows are broken down by the following instruments:

- equity capital;
- acquisition or disposal of real estate;
- reinvested earnings;
- trade credit;
- short-term and long-term loan capital; and
- other capital.
9.2 DEFINITION

Estonia complies with the recommendations for direct investment items set out in the BPM5. The 10% rule is applied as well as the directional principle. Inter-company loans are included under direct investment. Special-purpose entities are not significant in Estonia, and such transactions are not treated differently. Reinvested earnings are recorded in both the income account and the financial account.

Investment transactions are recorded when the transactions are entered in a transactor’s books and a change of ownership has taken place. The debtor/creditor principle is used to govern the geographical allocation of investment.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

Contrary to international standards, the “Current Operating Performance Concept” (COPC) is not used to calculate the earnings of direct investment enterprises. Specifically, the deviations are to be found in the fact that (i) deductions are not made for depreciation of capital, or for provisions for host-country income and corporation taxes, and that (ii) realised and unrealised capital gains and losses, write-offs and exchange rate gains or losses are excluded.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

No estimation methods are used in the field of direct investment. For monthly b.o.p. estimates, two simple models are in use, which take into account data from the ITRS and indirect indicators.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection of portfolio investment data is part of the general reporting system. Additional information on listed companies is obtained from the Central Register of Securities. Information on banking sector transactions is obtained from banking statistics data. Data on portfolio investment transactions are collected on an aggregated basis. There is no universal securities database available at the national level.

Portfolio investment can be broken down by type of instrument (into equity securities, bonds and money market instruments), by country and by sector.

10.2 DEFINITION

Definitions for portfolio investment transactions are in line with the BPM5. Financial derivatives are excluded from portfolio investment and are treated as an independent category in the financial account. Transactions under repurchase agreements and related operations are not included under portfolio investment. Service charges, fees and commissions are excluded from the underlying financial instrument and are recorded as services. The debtor/creditor principle is used for portfolio investment transactions as the data are mainly obtained from surveys.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

In some cases, when the market price is not available, the balance sheet value is used for portfolio investment assets.

10.4 GAPS

No.

10.5 INTENDED HARMONISATION

None.
10.6 ESTIMATION METHODS

No estimations are used in the area of portfolio investment on a quarterly basis. In the monthly b.o.p., the item is estimated by using two different statistical models where the inputs are based on all available data (including data from the Central Register of Securities), the ITRS and other indirect indicators.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection of data on financial derivatives is part of the general reporting system. Information on banking sector transactions is obtained from banking statistics data. Data are available on a gross basis. In banking statistics, data on forwards, futures, swaps and options are identified separately. In the enterprise surveys the data are highly aggregated and the types of instruments are not identified. All transactions involving financial derivatives are recorded in the financial account. Financial derivatives can be broken down by sector and by country. There is no breakdown by instrument.

11.2 DEFINITIONS

Definitions for financial derivative transactions are in line with the BPM5. Financial derivatives are recorded as a separate category in the financial account.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

No significant deviations.

11.4 GAPS

As the data on financial derivatives received from surveys are in a highly aggregated form, the quality is difficult to assess.

11.5 INTENDED HARMONISATION

None.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection of other investment data is part of the general reporting system. For the banking sector, the balance sheet data from money and banking statistics are used. B.o.p. data are derived from special b.o.p. transaction report. Valuation changes are excluded whenever possible. Trade credits are collected through enterprise surveys and are recorded at the time the goods are bought or sold or the service is provided. Advance payments are recorded as they are made. Transactions involving the household sector are covered by the ITRS. Breakdowns of other investment are in line with the BPM5. Other investment can be broken down by instrument, sector and country.

12.2 DEFINITION

Definitions of other investment transactions implemented by Eesti Pank are in line with the BPM5.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

No deviations.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.
12.6 ESTIMATION METHODS

Some estimations, based on exports and imports, are made for the trade credits of enterprises not covered by the survey system. For monthly data, there are two models set up for estimating assets and liabilities of other sectors, based on the ITRS and on monetary and public information.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

Data collection on reserve assets is part of the general reporting system. The source of the data is Eesti Pank’s Central Accounting Department. Reserve assets are calculated monthly on a gross basis, taking into account realised and unrealised changes in stocks.

13.2 DEFINITION

Definitions of reserve assets are in line with the BPM5. Under the conditions of the Currency Board Arrangement, Eesti Pank is the only institution to hold official international reserves in Estonia. Reserve assets refer only to highly liquid, marketable and creditworthy foreign currency-denominated claims (consisting of foreign exchange, deposits and securities) on non-residents.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

Estonian i.i.p. is a statistical statement summarising the stocks of Estonia’s external assets and liabilities at the end of each quarter. Data are compiled according to the IMF guidelines set out in the BPM5. The data include the following categories:

- direct investment: equity capital, reinvested earnings, other capital;
- portfolio investment: equity securities, bonds and notes, money market instruments;
- financial derivatives;
- other investments: trade credits, loans, foreign exchange and deposits, other items; and
- reserve assets.

Data collection for the i.i.p. is part of the general reporting system, based mostly on surveys. Real stocks are used for its compilation. I.i.p. data are published on a quarterly basis. The data are available no later than the last working day of the quarter following the end of the reference quarter. Reconciliation exercises between i.i.p. stocks and b.o.p. flows are carried out regularly; adjustments relating to changes in exchange rates, prices and other factors are generally taken into account. There has been no intention to harmonise historical data on the basis of a reconciliation of b.o.p. flows and i.i.p. stocks because it is impossible to update stock data retroactively if flow data are revised.

14.1.2 DIRECT INVESTMENT

The definition of direct investment in Estonia’s b.o.p. corresponds with that of the BPM5. From the beginning of 2000, the benchmark for direct investment has been 10% of total equity capital, instead of 20% as previously used. Stock data and transactions are recorded at market prices and on an accruals basis. For listed or registered companies, the information obtained
from surveys is supplemented with data from the Central Register of Securities.

Direct investment is broken down into equity capital, reinvested earnings and other capital. Breakdowns by country and activity are also available for direct investment positions.

Stocks are given at market value if listed on the stock exchange.

14.1.3 PORTFOLIO INVESTMENT
The major items of data on stocks of portfolio investments are obtained both from questionnaires designed especially for enterprises, investment funds and other financial intermediaries and from the Central Register of Securities. Eesti Pank’s Financial Stability Department provides information on portfolio investment related to Estonian commercial banks. For listed or registered companies and securities, the information obtained from surveys is supplemented with data from the Central Register of Securities. The definition of portfolio investment in Estonia’s b.o.p. corresponds with that of the BPM5. Stock data and transactions are recorded in market prices and on an accruals basis. Portfolio investments are broken down into equity securities, bonds and banknotes and money market instruments. The market value is used if the instrument is listed.

Since 2003, breakdowns by country and activity have been available.

14.1.6 RESERVE ASSETS
Data collection on reserve assets is part of the general reporting system. The source of the data is Eesti Pank’s Central Accounting Department. Reserve assets are calculated monthly on a gross basis. Foreign currency assets and gold, included in reserves, are revalued monthly at the market price valid on the last business day of each month.

Definitions for reserve assets are in line with the BPM5. Under the conditions of the Currency Board Arrangement, Eesti Pank is the only institution to hold official international reserves in Estonia. Reserve assets only refer to highly liquid, marketable and creditworthy foreign currency-denominated claims (consisting of foreign exchange, deposits and securities) on non-residents.

14.2 DEVIATIONS FROM AGREED DEFINITIONS
None.

14.3 GAPS
None.

14.4 INTENDED HARMONISATION
None.

14.5 ESTIMATION METHODS
Estimations are made for the trade credit of enterprises not covered by the survey system,
for the valuation of the market value of stocks and also for accounts held abroad.

**15 CONTACTS**

This country information was drafted by Estonia in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Estonia should be addressed to:

Mr Jaanus Kroon
Head of the Balance of Payments and Economic Statistics Department
Eesti Pank

Tel.: +372 6 680 901
Fax: +372 6 680 899
E-mail: jkroon@epbe.ee
4.6 GREECE

ORGANISATION CHART
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Bank of Greece has been responsible for compiling and producing the Greek balance of payments (b.o.p.) statistics since 1929. The collection system was based on exchange controls and the monitoring of foreign exchange flows. However, the gradual liberalisation of the exchange control mechanism resulted in the system becoming increasingly ineffective in recording flows in the b.o.p., which, in turn, necessitated a change in the collection system. Short-term capital movements were liberalised in May 1994 and, in March 1995, the Bank of Greece began its search both for potential new methodologies for the compilation of its b.o.p. and for a new collection system. The Bank of Greece decided to employ a system similar to the Portuguese system for its new b.o.p. collection system. Monthly data derived from the new methodology and based on the conceptual framework set out in the fifth edition of the IMF Balance of Payments Manual (BPM5) were first produced in January 1999.

2.2 LEGISLATIVE PROVISIONS

The legal basis for the collection and compilation of b.o.p. transactions is contained in the Statute of the Bank of Greece. This legal base has been reinforced by provisions included in the new Statutes of the Bank of Greece (Law 2609/1998, as amended by Law 2832/2000), whereby all residents are required to report transactions with non-residents to the Bank of Greece for the compilation of the b.o.p. and for the international investment position (i.i.p.). The legislation provides for a sanctions procedure in the event of a failure to report b.o.p. transactions, as well as for the disclosure of confidential information.

2.3 INTERNAL ORGANISATION

The field of statistics is the responsibility of the Department of Statistics established by a Decision of the General Council of the Bank of Greece (23 October 2000). This Department has two Divisions, namely the Balance of Payments Statistics Division and the Monetary and Financial Statistics Division, as well as a DataBase Management Section and a Secretariat.

The Balance of Payments Statistics Division has 25 staff members, including the Head of the Division, in the following four sections:

- the International Investment Position Section,
- the Balance of Payments Compilation Section,
- the Bank of Greece and Non-Banking Sector Data Collection Section and
- the Banking Sector Data Collection Section.

The analysis of b.o.p./i.i.p. data, econometric work, etc. is the responsibility of the Economic Research Department (External Economic Affairs Division).

The Monetary and Financial Statistics Division has three sections: the Money and Banking Statistics Section, the Other Financial Institutions and Capital Market Statistics Section and the Financial Accounts Section.

2.4 EXTERNAL CO-OPERATION

The Bank of Greece is the only institution involved in the production of b.o.p. and i.i.p. statistics. The National Statistical Service of Greece (NSSG), however, supplies national accounts, trade data, the consumer price index (CPI), the gross national product (GNP), industrial production, tourist arrivals and other variables to the Bank of Greece. Data on the number of tourist arrivals/departures at all types of frontier stations (airports, seaports, railway and borders stations) are provided directly by the relevant Greek authorities. Trade
data supplied by the NSSG have been subject to long delays, especially as regards revisions, primarily owing to difficulties with the Intra-Community Trade Statistical System (Intrastat). The Bank of Greece therefore compiles its own data on merchandise trade using bank settlements and data supplied directly by enterprises (oil refineries). External debt is also compiled (stock data) by the Bank of Greece.

2.5 USERS

The Bank of Greece maintains regular contact with users, such as the NSSG, the Ministry of Economy and Finance, other government departments, universities, credit rating companies, etc. Bilateral meetings are sometimes held with users to discuss specific issues. A principal user is the bank’s own Economic Research Department. B.o.p. data, according to the standard components of the BPM5, are supplied to the European Central Bank (ECB), the European Commission (Statistical Office of the European Communities – Eurostat), the Organisation for Economic Co-operation and Development (OECD), the International Monetary Fund (IMF) and the Bank for International Settlements (BIS) on a regular basis.

Information derived from the press is used to cross-check the transactions in direct investment and to update the debt/liability registers.

3.2 REPORTING AGENTS

(i) **Banks**: these are commercial banks and other special credit institutions. They are required to report external transactions on behalf of residents and non-residents and on their own account, irrespective of whether they are acting as an intermediary between a non-resident bank or non-bank and another resident bank, or carrying out inter-bank operations affecting their external position. Resident banks must also report the opening and closing balances of their external position broken down by currency. Changes between the opening and closing positions should be equal to the net external transactions in the respective currencies unless the specific bank applies the exception threshold of €12,500. If an error is detected in earlier than the current month data, the Bank of Greece assesses the size and effect of the error in the overall data and decides whether or not to adjust the earlier data and the output. B.o.p. data which are more than six months old are considered to be definitive.

(ii) **Direct respondents**: direct respondents report transactions with non-residents which are not settled via resident banks. In addition, the system collects data directly from certain resident transactors.
such as oil refineries, mutual funds, stockbrokers and custodians.

(iii) Public sector: various departments of the Bank of Greece provide data for the compilation of the b.o.p./i.i.p., such as official current transfers, general government external debt, reserve assets, etc. The Ministry of Economy and Finance, as well as other departments of the Bank of Greece, also provide data on general government external debt and on transactions with European Union (EU) institutions.

**3.3 Thresholds**

Since 1 July 2002, in accordance with EU Regulation 2560/2001, the Greek b.o.p. system has provided for a threshold of €12,500, which means that low-value transactions are reported in aggregated form if banks wish to do so, or are not reported. Other transactions are reported on a transaction-by-transaction basis. For transactions of value lower than €100,000, and greater than €12,500 information on the resident transactor is available on request, as this has to be submitted, if required, to the Bank of Greece. However, most banks submit information on the resident transactor counterpart for all transactions where this is requested. The scrutiny of such large-value external transactions constitutes the most important quality check on the data submitted by banks acting as intermediaries.

**3.4 Availability of Data**

In order to meet the ECB’s monthly b.o.p. requirements, both in terms of coverage and timeliness, b.o.p. flow statistics are published monthly on a settlements basis. Imputations, netting-out operations for a number of transactions and the use of supplementary information provided by resident transactors are conducted on monthly b.o.p. data. Stock data are to be made available on an annual basis with a geographical breakdown. Portfolio

investment stocks are available on a monthly and quarterly basis, both for assets and for liabilities.

3.5 TIMELINESS

The reporting agents have 15 calendar days from the end of the reporting period (month) within which to submit data to the Bank of Greece, which thus has approximately three weeks within which to process the data, check their validity and compile reports for the various users and publications.

3.6 COMPILATION FREQUENCY

The Greek b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

The monthly data submitted on electronic media (diskettes or CD-ROMs) are loaded onto the RISC system (computer system used by the Bank of Greece). For each file received, the validity of the general information (bank identity, reporting period, etc.) is checked and verified by a computer programme. The data are also checked for validity and accuracy by means of plausibility checks and checks using previous months’ data. A listing of all errors found is produced and the reporting bank is notified immediately. Once the necessary corrections have been processed, a second round of validation takes place and flows are compared with the change in the external position of the reporting bank if the bank does not apply the exemption threshold of €12,500. Additional comparative reports are produced and manual checking takes place, principally of the high-value transactions (more than €100,000). It is difficult, however, to verify incoming payments on behalf of customers, as the banks do not always know why the payments have been received, and the customer must in some cases be asked about the nature of such transactions. A plausibility check is fairly easy for transactions above the amount of €100,000; below this amount plausibility checking is difficult to carry out.

3.8 REVISION POLICY

The Bank of Greece does not have a strict revision policy. In principle, monthly data is revised when the quarterly data are due for publication and supplementary information is available on e.g. financial account transactions. NSSG monthly trade data are also used for cross-checks.

3.9 PUBLICATION

The titles of the publications produced by the Bank of Greece on b.o.p. statistics are listed in Sub-section 13.1.

Data users of the Greek b.o.p./i.i.p. statistics are:

(i) other units of the Bank of Greece, e.g. the External Economic Affairs Division, the Money and Banking Division, the Governor’s and Deputy Governors’ offices;

(ii) other institutions, e.g. the Ministry of Economy and Finance, other Government departments, universities, banks, embassies and others.

The b.o.p./i.i.p. as well as the international reserves template data are released under “statistics/sdds” on the website of the Bank of Greece. An advance release calendar for the above-mentioned data is also available on the website of the Bank of Greece.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The current national presentation of the Greek b.o.p. covers the ECB’s b.o.p. requirements as endorsed by the Governing Council of the ECB.
4.2 ESTIMATION METHODS FOR THE MONTHLY B.O.P. DATA

4.2.1 FOR GOODS
The goods item is computed on the basis of settlements, as recorded via the ITRS; NSSG data for external trade statistics are not taken into account due to the time lag in data availability and revisions. Estimates are made by using trends and extrapolation from previous months in the case of missing respondents, but this is a procedure that is rarely used.

Data have been fully compliant with BPM5 standards since January 1999.

Supplementary information derived from oil refineries are used to cross-check and compile the data for the oil account.

Transactions under special Community programmes (Satellite, Airbus and others) are very rare in the Greek b.o.p and are examined on a case-by-case basis.

Data on trade credits – assets and liabilities – are collected annually from a survey of enterprises.

The c.i.f./f.o.b. rate is calculated automatically by the ITRS using the data from the respondent banks. For checking the conversion of imports from c.i.f. to f.o.b., as derived from reporting agents’ replies to questionnaires, the Bank of Greece applies a 5% rule check.

The Bank of Greece trade data are a cross between the special and general trade principles. The NSSG data published are on a special trade basis.

The geographical allocation of transactions is based on the country of origin/destination. Although reporting agents are also requested to report the country of consignment, these data cannot be cross-checked with customs data of the same period, as the latter become available only some time after the settlement data. Therefore, the goods data used to compile the euro area aggregates are principally based on the country of origin/destination.

No geographical breakdown is available in the case of military goods.

Seasonal adjustment methods are currently being tested.

4.2.2 FOR SERVICES
Data for services except travel are compiled from the ITRS. However, financial services flows are cross-checked with data from direct respondents (e.g. stockbrokers). A frontier travel survey has been commissioned by the Bank of Greece since May 2002 for purposes of estimating the expenditure of non-residents in Greece and of Greek residents abroad.

4.2.3 FOR INVESTMENT INCOME
Flows for investment income are based on settlements data. A mixed approach is used for quarterly statistics, where stock data are also taken into account. In case that data are not available on time, estimates are made on the basis of extrapolation from previous months.

Monthly data are not reported on an accruals basis.

A breakdown of investment income into its sub-components (direct investment income, portfolio investment income and other investment income) is available on a monthly basis.

The intra/extra-euro area split of income on portfolio investment income is obtained from the use of custodian information which is a first known counterpart split for liabilities.

4.2.4 FOR DIRECT INVESTMENT
There are no monthly estimates on reinvested earnings.

4.2.5 FOR PORTFOLIO INVESTMENT
Supplementary information on portfolio investment is obtained through the use of custodian statistics and other stock statistics.
and transactions supplied by stockbrokers and mutual funds, as well as by banks for their own account transactions.

Security-by-security data collection is carried out for monthly and quarterly stock data and monthly data on liabilities are also provided by stockbrokers.

Difficulties are encountered in the estimation of the intra/extra-euro area breakdown, especially in the case of liabilities where a geographical allocation is only available according to the first-known counterpart principle.

The offsetting entry for accrued interest is not currently available on a monthly basis.

4.2.6 FOR FINANCIAL DERIVATIVES
Data on financial derivatives are obtained through the ITRS.

4.2.7 FOR OTHER INVESTMENT
ITRS data are used, and are cross-checked with changes in the MFIs’ consolidated balance sheet position.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
Investment income data are available from the ITRS.

Adjustment between annual, quarterly and monthly figures are made when more detailed data become available on a quarterly basis and in some cases annually.

The geographical allocation of investment income is usually made according to the country of settlement; in the case of portfolio investment it is made according to the residency of the issuer of the asset and of the first known counterpart in the case of liabilities. No geographical breakdown is available for historical data.

Dividends are recorded as of the date they are paid.

5.1.2 INCOME ON DIRECT INVESTMENT
With regard to income on equity, the rate of return is estimated using a proxy based on the foreign direct investment companies listed on the Athens Stock Exchange. Annual data for reinvested earnings are obtained from the annual foreign direct investment questionnaire.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
The calculation of income on portfolio investment is currently available from the ITRS, while stock data are used for the intra/extra-euro area split.

There are no major problems with the recording of income for specific types of bonds.

No impact on portfolio investment income due to taxation issues has been observed.

5.1.4 INCOME ON OTHER INVESTMENT
The Bank of Greece does not record income on trade credits. Transactions in deposits by private individuals/enterprises with foreign institutions are recorded, but the interest share in leasing payments is missing.

Income on reserve assets is recorded on an accrual basis.

5.2 DEFINITIONS

With the exception of the items given in Subsections 5.3 and 5.4, the Bank of Greece complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

Interest income is not recorded on an accrual basis.
5.4 GAPS

With regard to income on debt, income on intercompany loans is not currently recorded. Moreover, the Bank of Greece, in common with most compiling institutions, encounters difficulties with the recording of income on trade credits. Data on reinvested earnings are only included in the annual b.o.p after the publication of the annual statements of enterprises in May/June each year. Income on collective investment institutions (CIIs) is not fully covered.

5.5 INTENDED HARMONISATION

Estimation methods to record reinvested earnings on a monthly and quarterly basis are being tested.

5.6 ESTIMATION METHODS

None.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2). Data for general government transactions are available for EU budget transfers, i.e. specific information on capital transfers involving EU institutions.

A distinction between current and capital transfers is usually difficult to apply for private sector transfers when the amounts involved are not sizeable. Nevertheless, Greece is able to provide separate monthly data for the capital account, since the biggest part, capital transfers related to EU institutions, can be estimated on the basis of combined information from the European Commission (Eurostat) and the Greek Government.

6.2 DEFINITION

In principle, the definition of the capital account is in accordance with the BPM5 and the harmonisation proposals made by ECB.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

Emigrants’ remittances are recorded under current transfers, but the balances of their accounts held with resident MFIs are not considered to be an external liability. As a concept, this treatment is not significantly different from the “centre of economic interest” IMF residency guidelines for the following reasons:

– emigrants’ accounts are usually jointly held with residents of Greece, so they cannot be viewed as a liability to non-residents;

– emigrants are in fact individuals who, in many cases, spend part of every year in Greece, and can thus be said to have “multiple residency” status (paragraph 72, BPM5);

– emigrants can maintain these accounts, even if they no longer live abroad and have returned to Greece and acquired the status of resident.

Historically, emigrants’ deposits held with Greek banks have been used almost entirely to finance expenditure in Greece, i.e. they have been similar to current transfers. Thus these deposits do not have the characteristics of a short-term financial instrument. The stocks of such deposits, even in times of financial or political crisis, have not shown the sharp fluctuations common to short-term instruments.

6.5 INTENDED HARMONISATION

None.
CHAPTER 4.6
GREECE

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

As regards FDI data, in the past only authorisation data (i.e. data on FDI which had been officially authorised) were collected, but the series stopped in 1992.

After compiling a register of foreign direct investment (FDI) companies, the Bank of Greece started collecting FDI data for the period from 1995 to 1998, using an annual pilot questionnaire for both inward and outward FDI. Annual data from 1998 onwards have been included in the i.i.p. submitted to the ECB.

Data from the annual questionnaires, which are based on FDI register information, are supplemented by data from various sources, such as the ITRS – flow statistics, press reports and information from Bank of Greece branches.

Difficulties in delimiting direct investment and portfolio investment have been resolved, as quarterly information can be obtained from the Athens Stock Exchange in order to reallocate transactions of 10% or more of an entity’s capital to FDI. Quarterly/annual data are adjusted accordingly.

Information on long and short-term loans between affiliates is requested in the FDI questionnaire sent to respondents.

With regard to the treatment of special purpose entities, the Bank of Greece tries to record the relationship up to the second level.

Domestic stocks acquired by non-resident investors through secondary markets can be identified, since the Athens Stock Exchange publishes confidential information on all transactions involving more than 10% of the share capital of any listed company.

Transactions settled through an exchange of shares are recorded at the time when the exchange of shares takes place.

The valuation of transactions settled through an exchange of shares is based on the price at which the transaction, i.e. the transfer of the shares of the resident holder to the non resident, is recorded. For listed companies, any transfer of shares has to be made through the electronic system of the Athens Stock Exchange.

The geographical breakdown is based on the residency of the actual issuers (i.e. debtor/creditor principle) for the assets and first known counterpart for liabilities.

7.2 DEFINITION

For flows, the Bank of Greece complies with the 10% rule and adds 50% in order to make the compilation of foreign affiliates’ trade statistics (FATS) possible.

Reporting agents were informed via the new reporting instructions that they must apply the directional principle.

Cross-border transactions in real estate are reported through the bank reporting system (ITRS).

7.3 DEVIATIONS FROM AGREED DEFINITIONS

The directional principle may not be applied in all cases (i.e. reverse investment by the direct investment enterprise in its direct investor). There seem to be no other deviations under the new collection system.

7.4 GAPS

Data on reinvested earnings are only included in annual b.o.p. after the publication of the annual statements of enterprises in May/June each year. Equity contributions without payment (i.e. providing real assets or financial assets) are difficult to identify; supplementary information is needed.
7.5 INTENDED HARMONISATION

The introduction of the new collection system has enabled the Bank of Greece to collect data on direct investment in accordance with the requirements of the BPM5. Estimation methods to record reinvested earnings on a monthly and quarterly basis are being tested.

7.6 ESTIMATION METHODS

Quarterly estimates in the field of direct investment are based on monthly b.o.p. flow data (ITRS).

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Inward flows: banks and direct respondents report portfolio investment data within the context of the general b.o.p. reporting scheme. Banks generally deal on their own account (usually in Greek Government bonds and Treasury bills) and only deal in shares if a new issue takes place or if they are acting as the underwriters of the deal itself. Discussions with banks have revealed three types of transactions: transactions on own account; transactions with non-residents where the resident bank acts as the custodian; and transactions with non-residents where the resident bank does not act as the custodian. For the first two types, all the information required by the ECB, the IMF, etc., is known. However, in the latter case, not all the details are available, so that the Bank of Greece has to contact the resident counterpart to complete the reporting form, as necessary.

Outward flows: for mutual funds and investment companies, all the necessary information is known for investments made through Greek banks and those for which Greek banks act as intermediaries.

Difficulties in delimiting direct investment and portfolio investment have been resolved, as quarterly information is obtained from the Athens Stock Exchange in order to reallocate transactions of more than 10% of an entity.

Stock data are used for checking purposes. The International Securities Identification Number (ISIN) for securities is used to check the flows against stocks.

The geographical allocation criterion for assets is based on the country of residence of the issuer. For liabilities, it is based on the first known counterpart principle. A detailed country breakdown is available on a quarterly and on an annual basis. Limited information is, however, available for historical data prior to the introduction of the new collection system.

8.2 DEFINITION

The Bank of Greece complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the ECB. However, the distinction between direct investment and portfolio investment is difficult to determine for reporting agents and can only be made by the Bank of Greece using the register of information on listed companies supplied by the Athens Stock Exchange and press reports.

Service charges, fees and commissions are excluded; the necessary information is obtained via the bank settlements system, as part of financial services.

Private placements are recorded in the b.o.p. Supplementary information may be needed to classify this properly.

Transactions in relation to the trading of loan portfolios are included in other investment. An annual survey of non-bank enterprises is carried out for external assets and liabilities.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

Interest is not accrued.
8.4 GAPS

For portfolio investment flows (outward), information is not available for investments made directly with non-residents, i.e. carried out through either a non-resident broker or bank.

8.5 INTENDED HARMONISATION

The Bank of Greece uses ISIN codes in its system. In addition, all resident stockbrokers, mutual funds and investment companies have to submit monthly supplementary information on both inward and outward portfolio investment transactions to the Bank of Greece.

8.6 ESTIMATION METHODS

None.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The recording of financial derivatives is based on ITRS data, but valuation is a problem that has not yet been fully resolved for over-the-counter transactions. Codes for financial derivatives are included in the general reporting system, as well as in the annual stock survey system. Income on financial derivatives (i.e. interest rates swaps) is recorded under financial derivatives.

9.2 DEFINITIONS

See Sub-section 9.1.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 9.1.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection system for data on loans relies on the information derived by the ITRS. Data for loans issued by the general government sector are not problematic, as are data for the banking sector, which are carefully checked for consistency with money and banking statistics. Data on loans from the non-banking sector are not problematic if the loan is made via a resident bank. However, data are more difficult to capture if the loan is made by a resident directly with non-resident bank. If the resident does not ask a resident bank to “service” these loans, the loans cannot be recorded, as the customer has not declared them. An annual survey was first launched in 1998 (data for 1996 and 1997) to record the outstanding debt liabilities of the non-banks sector and has been repeated every year since then. This questionnaire has been extended to cover external assets and liabilities by type of instrument (bonds, loans, deposits, trade credits and financial derivatives). To this end, a questionnaire is sent to a sample population that now includes about 1,500 resident enterprises. The quality of data seems to be high.

Trade credit data are also collected through the above-mentioned annual survey.

In line with ECB requirements, the sectoral breakdown is available on a monthly basis, as is the breakdown by maturity for the MFI sector.
The breakdown by instrument is available at quarterly frequency.

10.2 DEFINITION

In principle, the Bank of Greece complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the ECB.

Data for trade credits are reported under other investment.

Both “genuine” repurchase agreements at a fixed price on a fixed date as well as sell/buy-back transactions are recorded.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

10.4 GAPS

Deposits: there is a gap in the data for the non-banking sector (on the assets side). BIS data are used to compile the annual i.i.p.

10.5 INTENDED HARMONISATION

Quarterly data available from the BIS are used as a proxy to cover the gap in the data for the assets of the non-banking sector.

10.6 ESTIMATION METHODS

There are no quarterly estimates for the other investment account.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The information is obtained from the Financial Operations Department of the Bank of Greece. A breakdown by instrument is available on a monthly basis.

11.2 DEFINITION

The Bank of Greece complies with the recommendations set out in the BPM5 and the Eurosystem’s harmonisation proposals.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

The Bank of Greece complies with the ECB recommendations regarding reserve assets.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection system of the Bank of Greece is based on pure stock data stemming from annual surveys for FDI and other investment monthly and quarterly surveys for portfolio investment (custodians, banks, etc.).

Stock statistics are compiled for all items:

– portfolio investment stock statistics are compiled on a monthly and quarterly basis using data from the Financial Operations Department of the Bank of Greece as well as data from custodians: private banking departments of MFIs, stockbrokers, mutual funds and investment companies;

– FDI statistics are compiled once a year on the basis of an annual questionnaire sent to about 1,500 companies taken from a business register;

– loan liabilities for general government and other sectors are compiled annually on the basis of data from the Bank of Greece and
from an annual survey sent out to private sector firms;

– MFIs’ external assets/liabilities are compiled on the basis of data included in their monthly balance sheet statistics provided to the Monetary and Financial Statistics Division of the Bank of Greece; and

– BIS data are also used.

Since September 2003, the Bank of Greece has been compiling quarterly data for the country’s external debt in accordance with the relevant IMF guidelines.

The Bank of Greece has no significant problems in providing a breakdown by sector or by instrument. For the geographical breakdown, similar problems are encountered as for the flows: assets can be allocated according to the issuer, but liabilities can only be allocated according to the first known counterpart.

There are no problems on timeliness.

### 12.2 DEFINITIONS

#### 12.2.1 GENERAL

The coverage and the concept of the i.i.p. items are broadly in line with the respective items of the b.o.p. financial account. The definitions are also in line with the recommendations in the BPM5, and with those of the ECB.

For the reconciliation adjustment, the changes in stock positions are compared with transactions, taking into account valuation adjustments.

The valuation is based on:

- (i) market values for equities;
- (ii) market values for bonds and Treasury bills;
- (iii) book values for FDI stocks abroad; and
- (iv) book and market values for FDI stocks in Greece.

#### 12.2.2 DIRECT INVESTMENT

The directional principle is followed and reinvested earnings are included.

#### 12.2.3 PORTFOLIO INVESTMENT

See Sub-section 12.2.1.

#### 12.2.4 FINANCIAL DERIVATIVES

See Sub-section 12.2.1.

#### 12.2.5 OTHER INVESTMENT

See Sub-section 12.2.1.

#### 12.2.6 RESERVE ASSETS

No major discrepancies occur when compiling reserve assets from Bank of Greece balance sheets.

Reserves assets data provided by the Financial Operations Department are valued at market prices.

#### 12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

#### 12.4 GAPS

None.

#### 12.5 INTENDED HARMONISATION

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Banco de España has been responsible for compiling the balance of payments (b.o.p.) statistics since 1991. Before then, their compilation was the responsibility of the Secretary of State for Trade at the Ministry of Economics. After the full liberalisation of cross-border economic transactions in 1992 and the publication of the new Balance of Payments Manual (5th edition) of the International Monetary Fund (IMF), the BPM5, a completely new b.o.p. data collection system was introduced in 1993.

2.2 LEGISLATIVE PROVISIONS

All residents in Spain are obliged, by Royal Decree, to declare all cross-border transactions they undertake. This is for fiscal and administrative reasons as well as for statistical purposes. The Banco de España, in turn, is responsible for declaring this information to the fiscal authorities.

The Royal Decree and circulars regulate the b.o.p. reporting obligations in a uniform manner. The burden of reporting is therefore equal for banks and all direct reporters. The legal basis provides the possibility of imposing sanctions on individuals and companies which do not fulfil their obligations to report on b.o.p. transactions. The sanctions imposed are of an administrative nature and take the form of a fine. Credit institutions can also be fined by the Banco de España whenever they fail to comply with the general rules imposed by the central bank.

2.3 INTERNAL ORGANISATION

Generally, all statistics produced by the Banco de España are compiled by the Directorate-General for Economics, Statistics and Research, which consists of three departments: the Economic Analysis and Forecasting Department, the Statistics and Central Balance Sheet Office Department and the Monetary and Financial Studies Department. The Balance of Payments Department, however, is not part of the above-mentioned Directorate-General; rather, it is located in the Directorate-General of International Affairs. The Balance of Payments Department has around 50 staff members.

The Balance of Payments Department cooperates continuously with the other departments of the Banco de España. The Statistics and Central Balance Sheet Office Department, which produces data for the national accounts (financial accounts), and the Balance of Payments Department work together on a regular basis to check that the figures produced for the national accounts are reconciled with the b.o.p. figures. Information on reserves and other transactions (both flows and stocks) of the monetary authority is provided by the operations departments. MFI’s data on stocks are also provided by the Directorate-General for Regulation.

2.4 EXTERNAL COOPERATION

The Balance of Payments Department consults the Government Customs Department, which provides figures for merchandise – foreign trade (intra-EU and extra-EU trade). A tape is provided on a monthly basis and adjustments to these data are carried out within the Banco de España. This is one-way traffic – the Balance of Payments Department does not provide data to the Customs Department. The trade statistics represent transaction data. Information obtained from the Central Securities Depository (Iberclear) enables the accruals principle to be applied to the interest paid by the Treasury on registered bonds and notes.

In the past, the involvement of the Ministry of Economics was primarily for exchange control reasons, whereas it is now for purely statistical purposes. The Banco de España uses some data provided by the Ministry for flow and stock figures on direct investment.
Cooperation with the National Institute of Statistics (NIS) is continuous in both directions. The Rest of the World (RoW) account is compiled by the Institute using b.o.p. data as a source. The Balance of Payments Department incorporates some estimates made by the NIS, mainly in the services account. With regard to travel, the Balance of Payments Department collaborates with the NIS and the Tourism Administration to produce the figures.

The Spanish Treasury provides detailed information on payments between Spanish institutions and the European Union which makes it possible to differentiate between current and capital transfers.

### 2.5 USERS

B.o.p. data according to the standard components of the BPM5 are supplied to international organisations, such as the ECB, the European Commission (Eurostat), the Organisation for Economic Co-ordination and Development (OECD), the IMF and the Bank for International Settlements (BIS), on a regular basis. Data are now transmitted to the ECB and the European Commission (Eurostat) using the GESMES/CB message format. The same applies to other organisations such as the IMF and the BIS, provided that they have agreed upon its use.

### 3 STATISTICAL SYSTEM

#### 3.1 TYPE OF COLLECTION SYSTEM

The Banco de España introduced a new data collection system in 1993. It is described as a “semi-closed settlement system”. The general reporting system is fully closed: all changes in the external accounts of banks or non-banks are explained by the full reporting of transactions (flows). The balance of the external account at the beginning of the period plus the transactions during the period equals the balance at the end of the period. The general reporting system is complemented by other sources:

- data on trade/goods are obtained from the Customs Department;
- data on government transactions (public transfers) are reported directly;
- the accruals principle is applied to the interest paid by the Treasury on registered bonds and notes, using information obtained from the Central Securities Depository (Iberclear);
- since January 2002, travel has been estimated using data on settlements complemented by indicators on supply and demand; and
- freight and related services data are provided by the NIS.

Further sources such as the supervisory reports of Monetary Financial Institutions (MFIs) are used for checking purposes and also to:

- obtain the geographical breakdown of MFIs’ other investment; and
- transform the reported net figures of the correspondent accounts of MFIs into gross figures.

The Banco de España is waiting for the establishment of the Centralised Securities Database (CSDB) which will be used to produce the split between euro area and non-euro area transactions in securities; meanwhile the BIS database is being used for data from 2001 onwards. Finally, all news available via public information systems (e.g. the press) and relevant for b.o.p. purposes is used to check the b.o.p. returns.

The Banco de España has started a process to complement and, in due course, replace the collection system currently in place. The design of the new system has not yet been completed, but some features can already be described: information on services will be collected from surveys carried out by the Spanish Statistics
Institute (INE). Information on traded securities has been collected since December 2001 using a system based on primarily indirect but also direct security-by-security reporting through custodians and financial intermediaries set up under Banco de España Circular 2/2001. This information was used for the first time to compile portfolio investment position data for December 2003, incorporating data from December 2002. Historical data have been revised in the case of listed shares taking into account the evolution of prices.

In the process of complementing the main sources, the Banco de España has started to use more intensively information from the Register of Foreign Direct Investment of the Ministry of Economics. In 2003, some b.o.p. transactions from this source were added. The use of stock information from this source to compile direct investment in the i.i.p. is being studied.

3.2 REPORTING AGENTS

The agents which provided the information needed to compile the external statistics are listed below.

(i) **Deposit money institutions**: these institutions are banks, savings banks and credit cooperatives. They must report the transactions with non-residents carried out both on their own account and on behalf of their customers, in accordance with Banco de España Circular 15/1992. Data submitted by this group of reporting agents should include the opening and closing balances of the accounts, and the credits and debits which explain the variation in the balances. Hence the change in the resulting balance must be equal to the sum of the individually declared flows. The plausibility of the data is checked against balance sheet data. Since December 2001 this group of reporting agents has been bound by the law to report on security accounts and the movements in these accounts on a security-by-security basis (Circular 2/2001).

(ii) **Other financial institutions** registered with the Banco de España or the Spanish National Stock Market Commission: these institutions are specialised lending institutions, agency brokers and broker-dealers. They must declare all transactions carried out on their own account and on behalf of their customers (Circular 15/1992). Since December 2001 this group of reporting agents has also been bound by the law to report on security accounts and the movements in these accounts on a security-by-security basis (Circular 2/2001).

(iii) **Holders of accounts with non-resident credit institutions or non-resident security depositories**: these account holders must report the opening and closing balances of their accounts and all operations settled through them to the Banco de España (Circular 24/1992). Since December 2001 this group of reporting agents has also been required to report on security accounts and the movements in these accounts on a security-by-security basis (Circular 2/2001).

(iv) **Inter-company accounts with non-resident firms** are becoming increasingly important. All transactions through these accounts must be reported directly to the Banco de España (Circular 24/1992), together with the opening and closing balances of these accounts and the transactions debited or credited through them (Circular 24/1992).

(v) **Clearing transactions with non-residents**: Clearing means any operation that does not give rise to a settlement via credits or debits on a bank or inter-company account, since it involves a receipt and a payment of the same amount with opposite signs. Residents who carry out such transactions must report them directly to the Banco de España (Circular 6/2000).

(vi) **Foreign lending and borrowing by residents other than credit institutions**:...

Spanish residents who carry out such transactions must report the terms of the loans or private issues to the Banco de España. This also includes the relationship between the lender and the borrower (Circular 6/2000).

3.3 THRESHOLDS

The reporting threshold for banks and direct reporters (foreign bank account holders or inter-company accounts) is not an exemption threshold, but a simplification threshold. For banks, the amount (€12,500) refers to individual transactions: only receipts and payments exceeding this amount are reported individually and the nature of the transaction specified. For direct reporters, the amount (€3 million) refers to the total transactions settled through the foreign account in any given month: if these transactions exceed €3 million, the account holders have to report them. If not, there is no obligation to report them in that particular month, and the transactions are reported in the following month (if the threshold is exceeded), or at the end of the year (if the threshold was not reached in any month). Only if the total amount of the transactions settled in the year is less than €600,000 are direct reporters not obliged to report them.

3.4 AVAILABILITY OF DATA

At the beginning of 1993 the Banco de España was aware of the requirements of the new BPM5 and it took advantage of this when preparing the new data collection system. Soon after the new data collection system was introduced, the Banco de España published b.o.p. figures in accordance with the requirements of the revised Manual and sent data translated into the new format to the international organisations. Data are available following the BPM5 from 1990 onwards.

3.5 TIMELINESS

At present, a complete set of data, including goods data supplied by the Customs Department, are available within six to ten weeks. Goods data for the provision of the monthly b.o.p. within six weeks are estimated by the Banco de España when the above-mentioned data are not available (see Subsection 4.2.1 below).

3.6 COMPILATION FREQUENCY

The Spanish b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

There are three levels of checking controls which can be distinguished. First, a fairly complete set of validity and consistency checks has been defined that are executed on the data by automatic procedure. Second, controls on the aggregate data are carried out by means of macro-editing reports based on expected values. Unexpected results are checked, so that flows contributing to any suspicious figures are analysed and corrected if necessary. Third, a set of plausibility checks is performed on the data where the aggregated data are compared with the data reported on the balance sheets of the banks or with other data sources.

3.8 REVISION POLICY

When data for January are published, data for the previous 24 months are revised.

There is no differentiation between monthly, quarterly and annual figures in Spanish publications.
In the context of changes in the compilation system mentioned in Sub-section 3.1 above, and given the need to harmonise revision policies across the EU, the Banco de España intends to adapt its revision policy to the new circumstances.

3.9 PUBLICATION

The titles of the publications produced by the Banco de España on b.o.p. statistics are listed in Sub-section 13.1.

B.o.p. data are used internally by other units of the Banco de España as well as by other institutions to compile statistics and to carry out studies.

The dissemination follows the Special Data Dissemination Standards (SDDS) criteria. The Spanish b.o.p. data, together with the date of their release, are available on the Banco de España’s website (www.bde.es).

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The Banco de España can provide monthly euro area b.o.p. data in accordance with the requirements for the monthly b.o.p., including the euro area/non-euro area breakdown. Data for the monthly b.o.p. are available within five to six weeks. Nevertheless, since the customs data for goods sometimes become available at a later stage, the Banco de España has to estimate preliminary data for the goods item.

Coverage of banks and other financial institutions reporting directly to the BOP Department is always 100%. Data on residents holding accounts or having offsetting transactions, which are reported with a delay, are not estimated, and the information is incorporated when it is received, so that it is reflected in the data revisions.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

Data on trade in goods are, in principle, derived from customs data. B.o.p. compilers adjust these data by (i) the c.i.f./f.o.b. adjustment on imports; (ii) adding merchandise not crossing the frontiers; (iii) adjusting for rebates and discounts; (iv) adding goods procured in ports (only for debits), and (v) adjusting non-responses.

The concept of economic territory followed by the Banco de España includes the Canary Islands, Ceuta and Melilla.

Data from 1990 onwards are compliant with the BPM5 standards in force since 1993.

When data are not available on time, estimations are made, using the ARIMA model. The seasonal pattern of the settlement data is applied to the transactions. The number of revisions to be carried out depends on the Customs Department. Usually data are revised once, a year later.

The euro area/non-euro area split of transactions depends on the countries reported in the Intra-Community Trade Statistical System (Intrastat) or customs documents. Since the data referring to January 1998, the Banco de España has been following the principle of country of consignment in the data sent to the ECB and Eurostat. Spain applies the “special trade” principle, meaning that goods placed in bonded warehouses within the national territory of the reporting country and exports of goods previously kept in bonded warehousing are excluded from the b.o.p. statistics.

There is no special treatment for military goods. They are treated and allocated geographically as other goods.

Transactions in goods under special Community programmes (for example, the participation of a resident company CASA in Airbus) between resident companies and the
projects themselves are treated as transactions between residents and non-residents, and included in the goods items where appropriate. Geographical allocation is usually effected according to the countries participating in the project. Consequently, if all countries are euro area members, transactions are allocated intra-euro area; if there are countries that are EU Member States, but non-euro area members, they are allocated to intra-EU 15, extra-euro area. (The financial contributions of Spanish residents to such projects are included in the financial account as direct investments as the percentage of participation is usually higher than 10%).

For imports, a c.i.f./f.o.b. adjustment is carried out by applying a rate of 4.5% to the c.i.f.-based imports.

4.2.2 FOR SERVICES
Since January 2002, travel has been estimated using data on settlements complemented by indicators on the supply and demand.

Freight and related services data are provided by the NIS.

Financial services are included in the current account. They are compiled using the general reporting system, so that most of the payments and receipts are included.

4.2.3 FOR INVESTMENT INCOME
The monthly flows for the investment income account are mainly based on settlement data, with the exception of the income accrued by non-resident holdings of bonds and notes registered at the Central Securities Depository (Iberclear). In the case of Spain, monthly and quarterly data are fully consistent. Thus, no forecasts are produced in this area and the accruals principle is followed in the same way as for the quarterly b.o.p. Therefore, there are no monthly estimates for reinvested earnings from direct investment.

With regard to the geographical allocation of portfolio investment income, Spain is able to break down the inflows according to the debtor principle (subject to the limitations mentioned in Sub-section 8.1 below), and is thus able to identify the actual residency of the counterpart, as is required. No final counterpart can be identified for outflows of portfolio investment income.

The geographical allocation of other investment income of MFIs is made by using the Banking Supervision Reports.

No estimates are made in the event of data not being available on time.

4.2.4 FOR DIRECT INVESTMENT
There are no monthly estimates of reinvested earnings.

4.2.5 FOR PORTFOLIO INVESTMENT
The collection of monthly data takes place on a security-by-security basis. Book-entries for registered general government bonds and notes are used to apply the accruals principle to income on these instruments. No modelling is used.

With regard to the estimation of the geographical breakdown, the situation is similar to that described in Sub-section 8.1 below. While the actual residency of the debtor can be identified on the assets side (based on the BIS database and the International Securities Identification Number (ISIN)), the main problems of correct allocation are on the liabilities side and in the identification of the creditor’s residency.

4.2.6 FOR FINANCIAL DERIVATIVES
Only reported flows are included. No estimates are made.

4.2.7 FOR OTHER INVESTMENT
Banking Supervision Reports are used to make the euro area/non-euro area split of MFIs’ flows and to translate some of the reported net flows into gross figures (see also Sub-section 3.1).
5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
This is part of the general reporting system (see Sub-section 3.1). Neither stock statistics nor surveys are used with the exception of the income on bonds and notes registered at the Central Securities Depository (Iberclear).

Realised gains and losses are generally recorded correctly in the financial account. Income in financial derivatives (i.e. interest swaps) is included in the financial account, even for periods before January 1999.

Dividends are recorded as of the date they are paid.

Data for 1998 are fully consistent with the data for the following years. For previous years, the geographical breakdown of goods using the consignment principle is not available, the use of the ISIN is not possible, and the euro area/non-euro area split of the MFI sector in other investment and its income component is not available. For the historical data on all other components, a geographical breakdown is available on a monthly basis.

Adjustments or reconciliations between monthly, quarterly and annual figures are not necessary since no estimates are carried out for monthly data, in particular, and there should thus not be any inconsistencies.

The geographical allocation of investment income for both credits and debits is generally based on the debtor-creditor principle, except for portfolio investment income (see Sub-section 5.1.3). The main problems concern the income component of portfolio investment liabilities and the income on other investment of MFIs.

No bias towards the under-recording of credits can be seen with regard to the income account.

5.1.2 INCOME ON DIRECT INVESTMENT
With regard to income on equity, the Banco de España does not currently include any reinvested earnings in the b.o.p. Income is registered when it is paid. No rate of return on stocks is calculated.

Regarding income on debt, interest on inter-company loans is recorded appropriately owing to the fact that all loans are reported directly to the Banco de España, which can separately identify inter-company loans and the corresponding income transactions. This also applies to income on trade credits between affiliates.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
The return on income on debt is not usually calculated on the basis of stocks (see also the remarks in Sub-section 5.1.1), except in the case of general government registered bonds and notes. Income on specific types of bonds (i.e. indexed bonds) is recorded when amounts paid or received are registered.

Accrued interest from the date of the last coupon payment to the date on which the transaction takes place is registered as part of the price of the bond and “coupon washing” distortions are eliminated by recording the income on these bonds and notes on an accruals basis.

Income related to money market instruments is not well-covered; however, the amounts are not significant in the Spanish b.o.p. Accruals are not applied to these instruments.

The impact of taxation issues on portfolio investment income are difficult to assess.

With regard to the geographical breakdown of income on portfolio investment, Spain is able to break down the inflows according to the debtor principle, based on the BIS database and the ISIN, and thus to identify the actual residency of the counterpart. The issuer principle can consequently be applied in a way similar to the treatment of portfolio investment in the...
financial account. However, this principle is less efficient as a result of the absence of a Centralised Securities Database (see Sub-section 8.1 below). No final counterpart can be identified for the outflows of portfolio investment income.

5.1.4 INCOME ON OTHER INVESTMENT
Reported flows on the share of interest in leasing payments are included under income on other investment.

The geographical allocation of income on other investments of MFIs is based on the stock data of the Banking Supervision Reports.

Data on income on reserve assets are provided by the Operations Department.

5.2 DEFINITIONS
Apart from the fact that it does not take into account reinvested earnings for income on equity, the Banco de España complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserve Statistics.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
See Sub-section 5.1.2 concerning the recording of reinvested earnings.

5.4 GAPS
Reinvested earnings in direct investment income are not included. With regard to income on collective investment institutions (CIIs), Spain registers only the part of the dividends paid.

5.5 INTENDED HARMONISATION
Procedures to calculate reinvested earnings and to improve the application of accruals are under study.

5.6 ESTIMATION METHODS
Accruals are estimated only for income on Spanish general government registered bonds and notes, using the daily stock data available from the Central Securities Depository (Iberclear).

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION
A specific issue is related to the recording of the principal and return of the sales of UMTS licences which should, in principle, be reflected in the capital account. However, since these transactions are usually channelled via direct investment companies (i.e. a non-resident buys UMTS licences via its Spanish affiliate), such transactions have, so far, been recorded under direct investment.

6.2 DEFINITION
Adaptation to the new requirements was accomplished at an early stage in most areas. The following criteria for distinguishing between current and capital transfers are applied:

– for transfers with the EU institutions, allocation takes place according to the agreements reached by the European Commission (Eurostat);

– for other transfers, reporting agents allocate according to the instructions given by the Banco de España.

6.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

6.4 GAPS
None.
6.5 INTENDED HARMONISATION

None.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

This forms part of the general reporting system (see Sub-section 3.2) from which mainly settlement data are derived. Furthermore, the Banco de España uses some data provided by the Ministry of Economics to obtain flow figures on direct investment. This information allows the Banco de España to estimate foreign direct investment in Spain in the form of quoted shares (these data are not available in the settlement system, in which all investments in listed securities are reported as a lump sum) and to check for and sometimes capture missing transactions (mainly those of special-purpose entities). The breakdown of direct investment flows by resident economic activity of the resident company is made by using a database that relates each company with each economic activity. The sources of this database are the General Business Register of the NIS, the Statistics and Central Balance Sheet Office Department of the Banco de España and the partial direct declaration information available in the Balance of Payments Department.

Historical data for 1998 are fully in line with the data for 1999 and following years; there are no methodological breaks in the time series.

All inter-company loans are covered, except those short-term trade credits which are not effected via inter-company accounts. Transactions in equity contributions without payments may not always be fully covered, although there is an obligation to report this kind of transaction, whether in the form of real or of financial assets, to the Banco de España.

The geographical breakdown is based on the residency of the actual issuers on the assets side and the first known counterpart on the liabilities side.

Transactions settled through an exchange of shares are recorded at the time when the exchange of shares takes place.

The valuation of transactions settled through an exchange of shares is based on the agreed price, or on the market prices at the time of the exchange, if no price has been agreed.

7.2 DEFINITION

With the exception of reinvested earnings, the Banco de España complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves. Special purpose entities are treated as recommended in the BPM5. Furthermore, all cross-border transactions in real estate are covered.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

The main deviation is the absence of reinvested earnings. Difficulties are encountered in the identification of some transactions as direct investment such as: (i) debt securities; (ii) cross-participations of less than 10% (mostly included in portfolio investment); and (iii) foreign direct investment in Spain through the acquisition of listed shares.

7.4 GAPS

No information is available on reinvested earnings.

7.5 INTENDED HARMONISATION

Two procedures to estimate reinvested earnings are under study:

- the use of rates based on information available in the Statistics and Central Balance Sheet Office Department (liabilities) and calculated using data of other countries (assets);
7.6 ESTIMATION METHODS

There are no quarterly estimates for the direct investment account.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

This forms part of the general reporting system (see Sub-section 3.2).

All transactions in securities are reported with the ISIN. This number is used to make the geographical breakdown for portfolio assets and related income. First, it is cross-checked with the BIS database. In those cases in which the ISIN is found, the country of the issuer is incorporated from this database. In the rest of the cases, the first two digits of the ISIN are taken to represent the issuer country and used to make the geographical allocation. The ISIN is only available from 1998 onwards. Stock data are not used to calculate flows.

The Banco de España is currently awaiting the establishment of a centralised securities database which would ensure the correct allocation of assets, provided that all Member States participated, and foster further harmonisation of data.

The geographical allocation criterion follows the issuer principle on the assets side (subject to the limitations mentioned in the first paragraph of this Chapter), meaning that the actual residency of the counterpart can be identified. This geographical breakdown is available on a monthly basis from 1998 onwards. Liabilities are allocated according to the first known counterpart. This is also in line with the allocation of the income item for portfolio investment (see Sub-section 5.1.3, last paragraph).

On the liabilities side, payments associated with transactions via financial centres (intermediaries as well as investment funds), international custodians and lead managers are allocated to the country of the financial centre, etc. The same applies to payments to international clearing systems (i.e. Euroclear or Clearstream) where no more detailed identification of the security holder is possible. Consequently, many transactions on the liabilities side are allocated to Luxembourg and Belgium.

Trading in loan portfolios is not captured in the portfolio account; the collateral deposits are included in the Spanish b.o.p., as other investment.

The Banco de España has noticed an increase in securitisation and the use of repurchase agreements and bond lending.

For both the b.o.p. and the i.i.p., the Banco de España is planning to use in the near future the information obtained from the new reporting system on traded securities based on information from domestic custodians and other resident investors which deal directly with non-resident custodians (see Sub-section 3.1 above).

8.2 DEFINITION

In principle, the Banco de España complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves.

MFIs are required to exclude any kind of financial service (i.e. service charges, fees, and commissions) from their reporting under portfolio investment.

Income related to money market instruments is not well-covered and accruals are not applied (see also Sub-section 5.1.3).
8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

The ISIN is regarded as a possible means of improving the quality of the data. However, the correct use of the ISIN requires a centralised securities database.

8.6 ESTIMATION METHODS

There are no quarterly estimates for the portfolio investment account.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

This forms part of the general reporting system (see Sub-section 3.2).

Within the Spanish b.o.p., financial derivatives capture options issued over-the-counter (OTC) or on organised markets, financial futures issued on organised markets, warrants on securities, OTC futures contracts, forward rate agreements, currency and interest rate swaps and other swaps. The treatment of financial derivatives as recommended by the BPM5 is virtually impossible to achieve in all cases.

Payments and receipts associated with transactions involving derivatives are reported to the Banco de España according to the different concepts for each type of instrument. The instruments are listed in the reporting instructions issued by the Banco de España to the MFIs. When payments are on a “net” basis, the MFIs are asked to report all the transactions involved, implying that the underlying payments and receipts are included in the financial derivatives account of the Spanish b.o.p.

The reporting instructions also stipulate that the reporting agents have to separate the margins to be included in deposits from those to be considered as financial derivatives. Although the terminology “option style” and “future style” is not used, the result should be the same.

The premium for options is recorded.

Gross data (credits and debits) are available, but they are not checked since only net data are published.

Concerning the geographical breakdown for derivatives, for some OTC contracts, the actual residency of the counterpart can be reported. However, if clearing houses are involved in derivatives transactions, identification of the actual residency of the counterpart is impossible. In this case, the Banco de España can only distinguish between the transactions of Spanish clearing houses and those of foreign clearing houses. There are no major problems when derivatives are reported as “net of nets”.

9.2 DEFINITIONS

The coverage of the financial derivatives item has improved in the Spanish b.o.p. Owing to the specific reporting guidelines for the reporting agents, all deviations from the BPM5 for the recording of transactions in financial derivatives should have disappeared. Nevertheless, reporting agents may still face problems in following the instructions, for instance in cases where options are executed and the underlying instrument is bought or sold.

The net stream of settlement flows associated with interest rate derivatives is recorded correctly under financial derivatives.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 9.2.
9.4 GAPS
As mentioned in Sub-section 9.1, the main gaps are related to the correct treatment of some transactions.

9.5 INTENDED HARMONISATION
None.

9.6 ESTIMATION METHODS
There are no quarterly estimates for financial derivatives.

10 OTHER INVESTMENT
10.1 SPECIFIC FEATURES OF DATA COLLECTION
This is part of the general reporting system (see Sub-section 3.2).

As a general rule, actual flows are recorded; however, the euro area/non-euro area split and the transformation from net figures into gross figures are based on the use of stock data from Banking Supervision Reports. Both the maturity breakdown and the sector breakdown can be compiled for the monthly b.o.p.

Differentiation between loans and deposits for MFIs is problematic for the b.o.p. compiler, as is the inclusion of financial leasing under loans, instead of under trade credits. Long-term trade credits have to be reported when goods are delivered.

The euro area/non-euro area split of MFIs’ transactions is not available for periods before 1998.

Extra-euro area b.o.p. flows for the MFI sector are derived from the MFIs’ balance sheets at the beginning and end of period, with an adjustment for exchange rate fluctuations.

Transactions carried out through TARGET are reported under the general reporting system. Usually the MFIs report the concept of the payments/receipts and the Banco de España reports the change in the accounts with the ECB.

10.2 DEFINITION
In principle, the Banco de España complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics.

Foreign currency notes and coins, financial leasing, repos and collateral deposits are included under other investment.

All claims and liabilities between affiliated enterprises are recorded correctly under direct investment (see Sub-section 7.1).

Sell/buy-back transactions with Spanish securities (usually maturing within a month) predominate among cross-border repo-type transactions. Conversely, lending with collateral such as loan portfolio (also included under other investment) is less significant.

Since January 2002, an estimation of the increase in financial assets received by Spanish residents from non-resident travellers in payment for tourism services when the financial assets received are euro banknotes (net from the euro banknotes paid by resident travellers to non-residents) has also been included in other investments of other resident sectors as an intra-euro area asset.

10.3 DEVIATIONS FROM AGREED DEFINITIONS
Short-term trade credits are not included and advance payments are included as payments of goods, rather than as trade credits.

10.4 GAPS
No information on short-term trade credits is provided.
10.5 INTENDED HARMONISATION

No change is planned to rectify the recording of advance payments as trade credits.

10.6 ESTIMATION METHODS

There are no quarterly estimates in the field of other investment.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

This is part of the general reporting system (see Sub-section 3.2).

11.2 DEFINITION

The presentation follows the recommendations of the BPM5 concerning the financial assets included (financial assets that are readily available to the monetary authorities such as gold, special drawing rights, position in the IMF, foreign exchange assets and other reserve assets) and the exclusion of changes in valuation, which are induced by exchange rate or price fluctuations.

Pure transactions data broken down by instrument are available since January 2000, with data from the Operations Department. In accordance with ECB recommendations financial derivatives are recorded separately and on a net basis. Gold swaps are recorded as repos.

With regard to the use of market prices, recording is carried out according to the principle laid down in the ECB recommendations. Both valuation and conversion into euro are made on the basis of the market prices and market exchange rates prevailing at the time of the transaction.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

Data availability is unproblematic.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The main statistical sources for the compilation of the i.i.p. are:

(i) The MFIs’ reports to the Directorate-General for Regulation of the Banco de España. The credit institutions’ balance sheets are used directly to obtain the stocks of their financial assets and liabilities vis-à-vis the rest of the world;

(ii) Since December 2001 portfolio investment items have been compiled using a system, which was set up under Banco de España Circular 2/2001, based on primarily indirect security-by-security reporting through the Spanish CSD custodians and financial intermediaries. In addition, direct information provided by resident entities or individuals dealing with non-resident custodians is included in this compilation system. This information was used for the first time to compile portfolio investment position data for December 2003, incorporating data from December 2002. In the case of listed shares, historical data have been revised taking into account valuation changes.

(iii) The Register of external loans granted and received by resident sectors other than the credit system in the Banco de España’s Balance of Payments Department. These statistics are compiled from the administrative accounting documents created to monitor both loans traded by the other resident and general government...
sectors with non-residents and the issuance of non-marketable securities by residents other than the credit system. The figures obtained from this source cover both loans between related (parent companies and affiliates) and non-related companies and financing obtained through Euronotes, commercial paper and other issuance programmes. Depending on the relationship between the two counterparts involved, each transaction is recorded under direct investment, portfolio investment or other investment;

(iv) The Banco de España’s Operations Department, for reserve assets and for the rest of the Banco de España’s foreign assets and liabilities;

(v) B.o.p. statistics which are used to construct the stocks when there are no reliable census statistics on a specific financial instrument;

(vi) The BIS to estimate the initial asset position of non-financial resident sectors with non-resident credit institutions;

(vii) Other sources: the Banco de España has a very detailed databank on securities denominated in both domestic and foreign currency which are issued by resident institutions, encompassing data obtained from the Central Securities Depository (Iberclear), the National Securities Market Commission (CNMV) and numerous specialised publications.

The data collection system of the Banco de España is based on a combination of pure stock data and the accumulation of flows. The coverage is good, except in the case of reinvested earnings in other sectors and financial derivatives. In some cases the accumulation of flows may produce deviations from real stocks. In particular, data are derived in one of the two following ways:

– directly from the sources of information available, when they provide data on stocks. Most of these stocks are valued in accordance with the IMF’s guidelines; or

– by the accumulation of flows. In those items for which this procedure has been used, unless indicated otherwise, the initial end-1992 stocks have been taken as the starting point. These, in turn, have normally been estimated through the accumulation of flows and corrected – where applicable – for the exchange rate valuation effect, as taken from the b.o.p. on a cash basis, which has been available since 1959. The stocks compiled since 1993 have been obtained by adding the flows of the items of the financial account of the b.o.p., adjusted – where necessary – for exchange rate valuation, to the initial stocks. This adjustment is made currency by currency. Moreover, these accumulated flows are corrected for changes in asset prices in those cases in which this effect has been significant and for which information is available.

Apart from differences due to changes in exchange rates and asset price adjustments, other differences between changes in i.i.p. stocks and b.o.p. flows relate to the different data sources used, especially in the following cases:

(i) sector allocation: the b.o.p. assigns flows of resident investment abroad to those sectors which acquired the assets involved. However, given the current data collection system, the redistribution of assets which may subsequently take place among the resident sectors is not taken into account. This redistribution is recorded, at least in part, in the stocks of the i.i.p.;

(ii) assets and liabilities relating to insurance operations: the technical reserves of insurance companies are included in the i.i.p., but are only partially recorded in the b.o.p.
The Banco de España does not experience any problems with regard to providing end-of-year data within the agreed period of nine months after the end of the respective year; nor does it have any difficulty with the breakdowns by sector or maturity. Nonetheless, it is necessary to emphasise the estimated nature of some of the figures obtained.

Concerning portfolio investment, the geographical allocation will be improved on the assets side with the use of the CSDB, but will remain affected by the practical impossibility of obtaining information on the actual end-investor on the liabilities side.

Spain participated in the 1997 and 2001 IMF Co-ordinated Portfolio Investment Surveys (CPIS) providing data produced by the Ministry of Economics, which has been conducting a similar survey since 1992. The 2002 CPIS was produced by the Banco de España using data from the new reporting system which provides data on tradable assets (see Sub-section 3.1). The Banco de España intends to continue providing these data on an annual basis.

### 12.2 DEFINITIONS

#### 12.2.1 GENERAL

The definitions correspond, in general, to those in the BPM5. The valuation criteria are essentially in line with the BPM5. The exceptions relate to cases where data are based on the accumulation of flows.

In the case of financial institutions, the general valuation criteria provide for:

- **assets** representing claims on persons or over property to be valued at cost; however, there are certain exceptions;

- assets purchased at a discount, except for marketable securities, have to be recorded at their redemption value. The difference between the amount recorded and the price paid has to be recorded in a balancing account until the assets disappear from the balance sheet;

- securities included in trading portfolios are valued at market prices;

- variable-yield securities not included in trading portfolios have to be valued at cost, adjusted – where applicable – for legally established write-downs or restatements;

- fixed-income securities not included in trading portfolios initially have to be recorded at cost, after the deduction – where applicable – of accrued interest, which has to be recorded temporarily in sundry accounts;

- balances representing payment obligations to be recorded at their redemption value. In the case of *liabilities* issued at a discount (securities or others), the difference between the redemption value and the amount received when the obligation to a third party is generated is treated in the same way as for assets other than securities issued at a discount.

At present, no reconciliation adjustment is made between stocks and transactions.

#### 12.2.2 DIRECT INVESTMENT

(i) **Spanish investment abroad (residents’ financial assets)**

The information under this heading effectively coincides with the provisions of the BPM5. The data on the stocks of the credit system are taken directly from its accounting statements, and those of other resident sectors are obtained, in the case of equity capital, by the accumulation of flows and corrected for exchange rate valuation effects. Other capital data for other resident sectors are obtained from the Register of external loans mentioned in Sub-section 12.1 (iii) above.
(ii) **Foreign investment in Spain (residents’ liabilities)**

The information under the heading of equity capital is an approximation to the concept of the BPM5. In principle, as far as shares are concerned, this caption encompasses all shares issued by resident companies which are neither listed nor in the process of listed on the stock exchange and only an estimation of direct investment through listed shares. Therefore, it includes part of portfolio investment through unlisted shares, but that part is of minor importance.

In the case of equity capital, stocks are obtained directly from the balance sheets of the MFIs and, for the rest of resident sectors, by accumulating flows corrected for exchange rate variations. Other capital stocks are obtained from the Register of loans mentioned in Sub-section 12.1 (iii) above.

### 12.2.3 PORTFOLIO INVESTMENT

(i) **Spanish investment abroad (residents’ financial assets)**

The various instruments included under this heading coincide with those indicated in the BPM5. Data are obtained from the new reporting system based on information from custodians and directly from holders of securities when they deal with non-resident custodians. The valuation is performed at market prices by the reporting agents.

The breakdown by instrument and maturity is available from the data source. The breakdown by sector is made by inputting the fiscal identification number from the source into a database which relates this number to a sector. The geographical breakdown is made on the basis of the ISIN and the BIS database. The quality of all the breakdowns will be improved with the use of the CSDB.

12.2.4 **FINANCIAL DERIVATIVES**

The Spanish i.i.p. does not include data on financial derivatives.

12.2.5 **OTHER INVESTMENT**

This heading includes the various investments indicated in the BPM5.

(ii) **Foreign investment in Spain (residents’ liabilities)**

The series on equity capital does not fully coincide with the concept of the BPM5, since only an estimation of direct investment in listed shares issued by residents is deducted, as required, from portfolio investment and recorded under direct investment. Furthermore, it excludes unlisted shares, but that part is of minor importance. Data are obtained from the new reporting system based on information from custodians and directly from holders of securities when they deal with non-resident custodians. The valuation is performed at market prices by the reporting agents.

With regard to the statistical sources, the loans received by general government and other resident sectors are obtained directly from the Register of loans mentioned in Sub-section 12.1 (iii) above.
The information on deposits and repos is taken from the accounting statements of resident credit institutions.

12.2.6 RESERVE ASSETS
As agreed in the report by the Working Group on Balance of Payments and External Reserves Statistics, positions in reserve assets are recorded at the closing mid-market prices at the end of the appropriate period, using the closing mid-market exchange rates prevailing at the reference date. Gold is recorded at the closing market price.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
Reinvested earnings of other resident sectors are not currently included.

12.4 GAPS
The main information gaps with regard to the availability of data on stocks are to be found in the non-financial private sector. It is necessary to make estimates in this sector for direct investment equity capital (both assets and liabilities) and for part of its deposits abroad. This lack of stock data is important, in particular because it hinders the application of the market price principle advocated in the BPM5.

12.5 INTENDED HARMONISATION
Two procedures to estimate reinvested earnings are under study:

- the use of rates based on information available in the Statistics and Central Balance Sheet Office Department (liabilities) and calculated using data of other countries (assets);

- the use of information available in the Investment Register of the Ministry of Economics.

The use of the CSDB will improve the geographical breakdown and will facilitate the quality control of other breakdowns.

12.6 ESTIMATION METHODS
See Sub-section 12.4.

13 ADMINISTRATION

13.1 TITLES OF PUBLICATIONS
Banco de España’s “Boletín Estadístico” (monthly)
Banco de España’s “Boletín Económico” (monthly)

1) At the Banque de France, the BoP Directorate is responsible for the compilation of figures, analyses, research and forecasts relating to all items of the Balance of payments (except the compilation of Goods figures), the International Investment Position and the International Banking or other BIS related Statistics.
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

In France, the authorities compiled a comprehensive balance of payments (b.o.p.) for the first time in 1945. First given to the Currency Control Board, this task was transferred to the Banque de France in December 1959 when the Currency Control Board was abolished. Since then, the Balance of Payments Directorate within the Directorate General Economics and International Relations has been responsible for compiling France’s balance of payments and international investment position (i.i.p.) on behalf of the Government.

2.2 LEGISLATIVE PROVISIONS

The legal basis for the compilation of the b.o.p. is provided in two legal texts (the Monetary and Financial Code, Art. L. 141-7, on the Statute of the Banque de France, and Decree No 2003-196, dated 7 March 2003), which set out the statistical obligation for residents to report their cross-border payments and their international assets and liabilities to the Banque de France.

2.3 INTERNAL ORGANISATION

At the Banque de France, statistics are compiled in two directorates within the Directorate General Economics and International Relations. B.o.p. statistics are compiled by the Balance of Payments Directorate, which is also responsible for compiling the i.i.p. and external debt statistics, making external forecasts, conducting various economic studies and providing the Bank for International Settlements (BIS) with Euro-money statistics and other financial data. As at the end of May 2003, the Balance of Payments Directorate had 160 staff members (on a full-time basis).

2.4 EXTERNAL COOPERATION

Use is made of various external information sources in order to compile the b.o.p. The INSEE (French national institute of economic and statistical information) provides the company register SIREN (system of identification code numbers for French firms), while FININFO (a commercial firm specialised in providing data on securities) provides the securities descriptions and the quotation records. Data on trade are obtained from the Customs Administration. Moreover, data originating from the Banking Commission are used for the analysis of external banking flows and stocks.

2.5 USERS

Information systems have been developed to provide international organisations, such as the ECB, the International Monetary Fund (IMF), the European Commission (Eurostat), the Organisation for Economic Co-operation and Development (OECD) and the Bank for International Settlements (BIS), with data on France’s b.o.p. in an efficient manner. The GESMES/TS message is used for b.o.p. data dissemination to the ECB, the European Commission (Eurostat) and to other organisations such as the IMF and the BIS which have agreed upon its use.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The b.o.p. collection system is a “semi-open system”. Reporting on transactions between residents and non-residents is based on the settlements of resident banks and of direct reporting companies. Transactions carried out by companies via an account abroad are reported directly to the central bank.

Stock statistics are used to compile:

(i) for portfolio investment: changes in foreign securities held by banks and money market mutual funds;

(ii) for other investment: general government and monetary
authorities’ financial flows. These are obtained from changes in stocks, adjusted for changes in exchange rates. This calculation is also used for the flows of the banking and non-depository financial intermediary (called “entreprises d’investissement”) sectors (loans and deposits) and for trade credits of resident firms.

The following data sources are used in addition to the returns of the actual b.o.p./i.i.p. statistics:

(i) The securities database managed by the Balance of Payments Directorate is used for two main purposes:
– checking the portfolio data, mostly provided by banks;
– producing the breakdowns required within the b.o.p. and i.i.p. (breakdown between French and foreign securities, geographical breakdown of foreign securities, breakdown by instrument (equity, bond, money market instrument), breakdown by issuing sector for French securities and those needed for analytical purposes (breakdowns between currencies, etc.)).

(ii) The database on resident firms (name, main shareholders, accounting data) managed by the Banque de France (Companies Directorate within the General Secretariat) is used for the stocks of foreign direct investment in France (identification of resident firms with foreign investors, accounting data).

(iii) BAFI is the database on financial agents. It is used to check the amount of the foreign securities portfolio held (and reported) by banks as well as foreign direct investment in resident banks (identification of resident banks in which foreign companies have holdings, accounting data).

It is also used for checking the amounts given in the monthly and quarterly b.o.p. reporting of the banking sector’s claims and liabilities vis-à-vis non-residents.

Further information is taken from:

(i) press releases, for checking transactions in direct investment and in portfolio investment;
(ii) returns from firms, helping to explain the flows on direct investment (mainly on equity capital: new investment and disinvestment);
(iii) Clearstream and Euroclear, for general government bonds or “OAT” stocks deposited with Clearstream and Euroclear (annual data);
(iv) the National Statistical Institute (INSEE), the Customs Administration and the Ministry of Transport (for other transportation in the transportation services item).

Moreover, data collected in cooperation with the Direction du Tourisme (i.e. a household survey and an inbound frontier survey) are used for the compilation of the travel services item, following the introduction of the euro banknotes and coins.

3.2 REPORTING AGENTS

(i) MFI sector: these are resident credit institutions and other financial institutions (e.g. money market funds) as defined in Community law.

– Banking sector: historically, the banking sector has been central to the reporting system. Although residents are no longer required to make transfers abroad via a resident bank, a large part of all operations is still channelled via the domestic banking sector. All operations which are carried out between residents and non-residents through the books of a bank on its own account and on the account of other sectors must be reported whenever individual
transactions are above the exemption threshold (€12,500) from January 2002. All transactions are given an individual economic code, except for most transactions concerning direct reporting agents (see paragraph (iv) below). The reports use the CRP (standard record of payment), which provides details of the nature, country, amount and currency of the transaction, as well as the identification number of the company (SIREN) and the identification number of the bank involved. For the data on deposit liabilities and lending vis-à-vis non-residents, the credit institutions report their outstanding amounts by counterpart and currency, with a distinction between long-term and short-term on both a monthly and a quarterly basis. A country breakdown is mandatory for all the banks each quarter, and is declared on a voluntary basis each month. Banks report on transactions in securities on their own account and on behalf of their customers. The use of the ISIN code and of a securities database ensures a high level of reliability of the instrumental, geographical and issuer sector breakdown for securities issued by residents and non-residents.

- Money market funds: a monthly return provides balance sheet information which is used for the compilation of the monetary and credit aggregates and for b.o.p. reporting purposes (other investment of MFI).

(ii) Central bank and monetary authorities: the Banque de France (Foreign Exchange Directorate within the Directorate General Operations) provides the Balance of Payments Directorate with data on reserve assets. Its own external assets and liabilities, moreover, are reported under other investment of the monetary authorities in the b.o.p. TARGET transactions are indirectly reported by the Accounting Department, via stock reports.

(iii) General government: this includes, first, the Treasury with the centralisation of its own flows with non-residents (accounts held with the Treasury by the Zone Franc countries, accounts held by some international entities, such as the European Commission, and operations conducted by French embassies and other general government units abroad). It also includes flows of other state agencies such as the Post Office.

(iv) Companies: companies report either directly or through the Banking sector, depending on the amount of transactions (general direct reporting companies) or the use of foreign accounts abroad (partial direct reporting companies).

Direct reporting companies (DRCs) report directly to the Banque de France on transactions and positions with non-residents through CRS (statistical record of transactions). There are nearly nearly 1,050 DRCs covering around 50% of the b.o.p. volume of the current account credits and debits. They are divided into “general” and “partial” direct reporting companies, comprising 480 and 570 firms respectively.

General direct reporting companies (DDGs) are companies or groups of companies with debits and credits in current account cross-border transactions exceeding a certain threshold in a given year for at least one item of services (some of them being aggregated) or income (see Sub-section 3.3). DDGs report all cross-border transactions to the Banque de France, including flows via foreign accounts and netting, except for portfolio investment cash management and capital revenue when these transactions are conducted through resident banks. Instead,
these types of transactions are reported by the domestic banks involved in the particular transactions. However, if these transactions are carried out directly via foreign accounts abroad, they remain under the responsibility of the DDG concerned, as it is the only entity aware of the transaction. At the request of the companies themselves there is no threshold for the items to be reported. The reports give details of the currency, amount, economic nature and geographical breakdown of the transactions. To avoid duplication, international payments carried out via a domestic bank are given a special – neutral – code by the bank.

Partial direct reporting companies (DDPs) are entities which hold accounts abroad or participate in an international netting through which payments are made or received. These companies are subject to direct reporting requirements when the monthly total of incoming and outgoing payments through the accounts exceeds the agreed threshold (see Sub-section 3.3). The reports of DDPs are similar to those of DDGs, but they only cover flows via their foreign accounts and changes of positions within these accounts. Other transactions between DDPs and non-residents are reported by the resident banking sector.

For DDGs and DDPs, banks report cash transfers between DDGs’ and DDPs’ domestic and external accounts using a neutral code. These transfers are also reported by DDGs and DDPs using a code which specifies the nature of the settlement.

(v) Customs: the Customs Administration (Ministry of the Economy, Finance and Industry) forwards data to the Banque de France, which serve as a basis for the compilation of the import and export account. It should be noted that the compilation of the “extra” part of transactions requires import flows to be broken down by country of origin and by country of consignment, to avoid double counting when aggregating the data of Member States (e.g.: an import from the United States (country of origin), arriving in Rotterdam (country of consignment)).

3.3 Thresholds

(i) An exemption threshold of €12,500 has been implemented since January 2002, applying to all the transactions passing through the banking system. Transactions below this threshold are no longer reported and are estimated by statistical means.

(ii) Companies or groups of companies with combined annual debits and credits in current account cross-border transactions exceeding a threshold of €30 million for at least one item of services (some of them being aggregated) or income are DDGs.

(iii) Partial direct reporting companies (DDPs) are subject to direct reporting requirements when the monthly total of incoming and outgoing payments through their accounts held abroad exceeds €1 million.

(iv) Concerning the reporting for the i.i.p., a threshold of €10 million has been set for the total outstanding amount of external assets or liabilities of residents on an individual basis.

3.4 Availability of Data

A nearly complete b.o.p. with a geographical and sectoral breakdown is available on a monthly basis. However, for other investment of the banking sector, the monthly geographical breakdown is partly based on a statistical treatment, using, in particular, the breakdown between residents of euro area countries and non-euro area residents provided by BAFI, the database on financial agents. In fact, major banks provide the Balance of Payments Directorate with a geographical breakdown of their own assets and liabilities on a monthly

basis, but the complete geographical breakdown is only recorded on a quarterly basis.

3.5 TIMELINESS

B.o.p. data are available 35 days after the end of the month of reference for ECB requirements and national purposes. The Banque de France is currently improving data timeliness, by means of an information campaign directed at banks and companies (late respondents are targeted as a priority to obtain the best information available for ECB requirements 35 days after the end of the month of reference). Improvements in timeliness are also expected as a result of the increase in electronic data transmission.

3.6 COMPILATION FREQUENCY

France’s b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

Checking procedures are aimed at obtaining the highest reliability/cost ratio. In addition to built-in computerised controls (data processing errors, anomalies or inconsistencies), there are systematic quality checks (plausibility, economic nature, codification, etc.). These checks are carried out, among other things, through a comparison between previous reports (i.e. previous month, quarter, half year, year, etc.) and current ones. These checks may be based on prior knowledge of the sector of the firm concerned, newspaper articles, contacts with the reporting banks and firms, or purely on staff expertise. Checks are also carried out using information obtained from BAFI, the database on financial agents managed by the Banking Supervision Commission’s General Secretariat.

Reporting by general direct reporting companies (DDGs) is checked for consistency with reports by banks. Each individual transaction reported by each direct reporting company (DRC) with an economic codification is matched to the reports made by banks on these individual transactions, using the identification code number (SIREN) of the concerned DRC which appears on the banks’ reports. The banks’ reports on DRCs are only used for comparison with the DRC reports; they are given a neutral b.o.p. code and they are not taken into account in the calculation of the b.o.p.

Partial direct reporting companies (DDPs) only report transactions carried out via accounts held abroad to the Banque de France. Cash transfers from an account held in France to an account held abroad must also be reported. Such cash transfers are also used to detect new DDPs. Since such transfers involve a domestic bank, these should be matched with the reports of the domestic banks. In addition, if the cash transfers are added to the transactions directly settled abroad, this sum should equal the difference between the opening and closing balances of the accounts abroad. Checks are carried out on a currency-by-currency basis.

Macroeconomic controls concern the general consistency of the whole b.o.p. Particular attention is paid to:
- closely monitoring the errors and omissions item and any major area likely to be the cause of errors and omissions; and
- consistency between investment income and the i.i.p.

The feedback from the ECB (the euro area b.o.p. and the contributions of individual Member States), allowing an analysis on a time series basis of the contribution of the French b.o.p. to the euro area b.o.p., is also an essential source for data controls.

3.8 REVISION POLICY

The first estimate made for monthly ECB items is revised on a quarterly and an annual basis. Should the need arise, data concerning previous years are also revised once a year. The revised figures are published in France’s “Balance of Payments Annual Report” and on the websites of the Banque de France (www.banque-
France.fr) and the Ministry of the Economy, Finance and Industry (www.finances.gouv.fr).

Historical data are revised whenever a fundamental methodological change is implemented.

3.9 DISSEMINATION

Users of b.o.p./i.i.p. data are: (i) other units within the Banque de France, such as the Directorate Monetary Research and Statistics as well as the market operators, (ii) other French administrative bodies such as general government, including the Ministry of the Economy, Finance and Industry (Treasury) and the National Statistical Institute (INSEE), (iii) international organisations such as the IMF, the OECD, the World Trade Organisation (WTO), etc. and (iv) universities and journalists.

As of January 2002, a joint communiqué from the Ministry of the Economy, Finance and Industry and the Banque de France provides figures similar to those sent to the ECB, updated with published trade figures. Moreover, the Banque de France publishes the same monthly figures concerning b.o.p. data in “The Banque de France Bulletin”. A b.o.p. on a quarterly basis is published 75 days after the end of the quarter on the internet. A geographical breakdown of the external assets and liabilities of the resident banking sector is available and is published on a quarterly basis. The annual b.o.p. is published jointly by the Banque de France and the Ministry of the Economy, Finance and Industry. This Annual Report includes the complete b.o.p., the i.i.p., historical data, current account data broken down by main partners’ countries and direct investment flows broken down by country and by sector.

The report also includes a few notes on the methodologies used. The titles of the publications produced by the Banque de France on b.o.p. statistics are listed in Sub-section 13.1 below.

Recent data are available on the internet, on the website of the Ministry of the Economy, Finance and Industry and on the website of the Banque de France. Time series are also available on the Banque de France’s website. The release timetable for b.o.p. figures is published by INSEE on behalf of the Ministry of the Economy, Finance and Industry.

The French data are also submitted by electronic means to external databases (i.e. the BIS).

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The Banque de France has provided monthly b.o.p. data in the format requested with effect from January 1997. For the period from January 1994 to December 1996, the Banque de France has also provided detailed monthly data, the origin/consignment breakdown of which differs from subsequent data, however. As from 1999, data are available within a six-week workable time limit.

The average coverage of respondents regarding monthly key items varies between reports from the MFI sector, for which coverage is at least 95% or more, and reports from companies in the context of direct reporting, where up to 30% may be subject to estimates.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR THE CURRENT ACCOUNT IN GENERAL

The Banque de France primarily uses the data already reported and checked in its own databases and supplements them with estimates, notably for goods, as these data are not sufficient and further refinement is needed.

The procedure followed by the section in charge of providing estimates consists of three steps to obtain merchandise data and the other monthly b.o.p. data of the current account, including investment income.
The first step provides estimates using two models, X-12 ARIMA and TRAMOSEATS, which provide seasonal adjustment as well as short-term forecasting. X-12 ARIMA produces short-term forecasts for four b.o.p. items, namely goods, services, income and current transfers. The model also forecasts the travel item. TRAMOSEATS provides estimates for each series within the current account (40 series) and for each key item. The respective credits and debits are given for each forecast. The analysis refers to monthly series (as from January 1990) of current account statistics between France and the rest of the world.

In a second step the settlements already recorded in the b.o.p. database are examined. Owing to the reduction in the reporting deadline, most sub-items within the services account (travel, for instance), current transfers and capital account are almost complete 35 days after the deadline for the monthly reporting.

In the third step the “economist expert” compares the results given by TRAMOSEATS and X-12 ARIMA with the settlements already recorded in the b.o.p. database. The expert makes the final choice. The last step relies far more on the economic insight of the forecaster, notably concerning the current economic situation. The estimates of investment income are also based on the last known data for portfolio investment stocks, and take into account the trend indicated by the portfolio investment flows.

The seasonally adjusted values are available for nearly all the current account sub-items, using the results of the TRAMOSEATS model. For external trade, the seasonally adjusted values are supplied by the Customs Division of the Ministry of the Economy, Finance and Industry.

All monthly transactions reported to the Banque de France are compiled with a geographical breakdown. For the time being, the “intra/extra” split is obtained from:

(i) an intra/extra split average calculated in debit and credit on historical series (five years);

(ii) the geographical allocation observed on the settlements already recorded in the b.o.p. database (except for external trade).

4.2.2 FOR GOODS
Owing to the shortening of publishing time, external trade data are generally available on time. However, when the customs data are not available on time, the estimations made by the BOP Directorate are given by country of origin and consignment as is required to avoid double-counting.

Furthermore, it must be noted that the Banque de France applies the “special trade” principle. External trade includes military goods. The geographical breakdown between intra-EU and extra-EU is made on the basis of data from the Customs Administration.

For transactions under special Community programmes, the value of the transactions on satellites relates to the cost of the launching. When the satellite belongs to an individual country, the geographical allocation is made using the country of the owner. When the satellite belongs to several EU Member States or to a European organisation it is recorded as a “non-allocated” intra-Euro 12 or intra-EU 15 transaction. The recording of AIRBUS transactions is different, depending to whether the assembly is made in France or in Germany (Hamburg). In the first case, they are regarded as external trade, i.e. recorded under “goods” and, in the second case, as “other merchandise”, i.e. recorded under “services”.

The c.i.f./f.o.b. rate is calculated once a year by the Customs Administration on the basis of a survey conducted in cooperation with companies. For imports, the calculation is made using the c.i.f. contracts; for exports, the calculation is made using f.o.b. contracts. The c.i.f./f.o.b. adjustment vis-à-vis the Euro 11
and Euro 12 is the sum of the adjustment relating to each of the Member States. The Customs Administration provides additional information related to the nature of transactions and the means of transport in view of adapting commodity trade data to the b.o.p. concepts.

4.2.3 FOR SERVICES
The methodology used to estimate services is analysed in Sub-section 4.2.1. However, it is important to note that the estimation is made item by item (including financial services), and that the b.o.p. items are then calculated by aggregating the different components.

4.2.4 FOR INVESTMENT INCOME
Further to the general remarks in Sub-section 4.2.1, some specific features of the estimation of investment income should be mentioned in the following paragraphs.

At present, monthly data on interest are recorded when the interest is payable (the “due to be paid” principle) and are thus not available on an accruals basis.

Monthly data on investment income are the results of a bottom-up approach stemming from the addition of the sub-components (direct investment income, portfolio investment income and other investment income) calculated previously. Hence, a breakdown into sub-components (direct investment income, portfolio investment and other investment income) is available for monthly data as well.

All monthly transactions reported to the Banque de France are compiled with a geographical breakdown. For the time being, the intra/extra split of portfolio investment income is obtained for monthly b.o.p. data from:

(i) an intra/extra split average calculated in debit and credit on historical series

(ii) the geographical allocation observed on the settlements already recorded in the b.o.p. database.

4.2.5 FOR DIRECT INVESTMENT
Monthly estimates of direct investment are based on transactions already recorded, plus data taken from the press, plus staff expertise.

4.2.6 FOR PORTFOLIO INVESTMENT
Monthly estimates of transactions in portfolio investment are essentially based on transactions already recorded on a security-by-security basis, plus data taken from the press (new issues of French bonds) or directly from the issuers (new issues by residents on international markets), plus staff expertise. No modelling takes place.

4.2.7 FOR FINANCIAL DERIVATIVES
Estimates of financial derivatives are based on transactions already recorded, plus staff expertise.

4.2.8 FOR OTHER INVESTMENT
Estimates of:

(i) Monetary Financial Institutions: estimates for the detailed geographical breakdown; except for the data provided by money market funds and banks which report a country breakdown of outstanding amounts on a monthly basis (E12/E13);

(ii) other sectors: based on transactions already recorded, plus staff expertise;

(iii) general government and monetary authorities: effective data are already available (no need for estimates).

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
This forms part of the general reporting system (see Sub-section 3.1).

A few years ago the Banque de France developed a statistical model which makes it possible to check the investment income item by
using stocks and representative interest rates for each type of security (bonds, shares, Treasury bills, etc.) and loans. The estimates also derive from the flows of transactions recorded between the dates of two positions. The results obtained with this model are compared with the settlements data sent by reporting agents. So far, it is merely used for checking and the results are not included in the b.o.p. Nevertheless, the Balance of Payments Directorate plans to use stocks to implement the accruals principle. At present, this principle is only applied when obtaining the interest actually included in financial flows relating to bond dealing. In the latter case, the Banque de France favours a global approach, as opposed to a security-by-security method. From a practical point of view, if stocks are used, it will be necessary to obtain a regular valuation of stocks marked-to-market.

Dividends are recorded as of the date they are paid.

Income on collective investment institutions (CIIs) is recorded in line with the method approved by Sub-group 1 (i.e. attributing all income resulting from investments made by the CIIs to the holders of the CIIs’ equity capital in the reporting period).

5.1.2 INCOME ON DIRECT INVESTMENT
With regard to income on equity, reinvested earnings (the difference between profits and dividends in a given year) are calculated and taken into account. Data on reinvested earnings included in the French b.o.p. pass through three successive stages: forecast, estimation and finalisation. Moreover, revisions are made to forecasts and estimated data as the information becomes available, until the final version is produced. The recording as well as the estimates and forecasts deal separately with profits and dividends.

Final flows of reinvested earnings are collected by the Balance of Payments Directorate through its annual surveys of French direct investment stocks abroad and foreign direct investment stocks in France. Until final data are available, two methods are used successively in order to determine reinvested earnings: estimates (for more distant periods) and forecasts (for the current period). They are sometimes used simultaneously on profits and dividends, depending on the information available.

Forecasts depend on global hypothesis and concern both profits and dividends:

(i) dividends: b.o.p. flows are extrapolated under an hypothesis of stability of the policy of the distribution of dividends;

(ii) profits: macroeconomic forecasts of profits in France and abroad are applied to the last known results of the firms covered by the two stock surveys.

With regard to income on debt, i.e. on inter-company loans, the interest on long-term loans, short-term loans, advances, deposits and cash transactions is recorded in the b.o.p., but under one economic code only, according to the general economic nomenclature of the French b.o.p. Currently, it is impossible to break down income on loans into income on inter-company loans and income on non-affiliated company loans.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
Where income on debt is concerned, the Banque de France does not record portfolio income on an accruals basis, except for the interest actually included in financial flows concerning bond dealing.

The geographical allocation of portfolio investment income credits is made according to the issuer for the majority of transactions above €1 million (and by country of settlement for the other transactions). If the country which appears on the record of payment sent by reporting agents (transactions higher than €1 million) is not the country of issue, corrections are made whenever the securities involved in the transaction can be identified (by virtue of the ISIN code). Where portfolio
CHAPTER 4.8 FRANCE

5.1.4 INCOME ON OTHER INVESTMENT
The interest on long-term loans, short-term loans, advances, deposits and cash transactions is recorded in the b.o.p., but under one economic code only, according to the general economic nomenclature of the French b.o.p. Currently it is impossible to break down income on loans into income on inter-company loans and income on non-affiliated company loans (see also Sub-section 5.1.2).

Income on trade credits granted by the resident banking sector and income on deposits made by private individuals/enterprises with foreign financial institutions are recorded under specific economic codes on a cash basis.

The interest share in leasing payments is included in the service items.

Income on reserve assets is recorded on a cash basis. Data are obtained from the Banque de France’s accounting system.

5.2 DEFINITIONS
The Banque de France complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks).

5.3 DEVIATIONS FROM AGREED DEFINITIONS
See Sub-section 5.1.2, last paragraph, for the recording of the income on inter-company loans. The accruals principle is not applied to interest.

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
Full implementation of the accruals principle for interest payments when common principles have been decided.

5.6 ESTIMATION METHODS
For quarterly data (timeliness: Q + 75 days), actual data are available and estimates are not needed. Accruals are not as yet estimated.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION
Part of the general reporting system (see Sub-section 3.2). With regard to the distinction between current and capital transfers, the Banque de France applies the criteria recommended by the BPM5. Thus, the capital account item covers transfers of fixed assets, on the one hand, and debt forgiveness, on the other. Most data are provided by the general government sector and the monetary financial institution (MFI) sector. They have to fill in a record of payment for this type of transaction, which is identified by a specific economic code. Some subsidies received from EU institutions are recorded (as investment grants) under the capital account, namely those from the European Regional Development Fund (ERDF) and European Agricultural Guidance and Guarantee Fund (EAGGF). All other subsidies are recorded under current transfers (general government item). Data on the acquisition/disposal of non-produced non-financial assets has been included in the capital account with effect from January 1996.

6.2 DEFINITION
The French definition of the capital account is in accordance with the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics.
6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

Information on investment grants is available on a monthly basis through ratios; the Eurostat proposal for these ratios provides relatively good proxies. Migrants’ transfers are partially reported by banks. For European transfers and for the split between current transfers and capital transfers, the definition is close to that proposed by Eurostat.

6.5 INTENDED HARMONISATION

None.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

Information is available in reports produced by the banks (for their own direct investment flows and for flows concerning resident firms, with the exception of DDGs) and from DDGs. All respondents have to report direct investment and portfolio investment flows separately.

The main source of information is the standard record of payment (CRP) and the statistical record of transactions (see Sub-section 3.2). Moreover, other sources are used to supplement the information provided by the CRP, but they are never used as such to compile the b.o.p. On the one hand, more detailed information than that conveyed by the CRP is sometimes transmitted by firms, or by the banks on account of their clients (i.e. the name and address of the non-resident counterpart and the total amount of the operation when the whole settlement is not made at once). This additional information is provided with legal forms called reports of investment, and only concerns direct investment flows in equity capital. On the other hand, the press and a mergers and acquisitions database are also used to anticipate new operations on equity capital.

The collection system draws mainly upon settlement data, except in the case of reinvested earnings (see Sub-section 5.1.2) and in the case of equity contributions without payment. In the case of the latter, information is tracked from newspapers to ascertain any equity contributions without payment. This information is subsequently checked with the companies concerned, so that the corresponding flows can be created in the French b.o.p. system. Finally, these flows are updated at the end of every year when the survey of stocks is carried out for the i.i.p.

Equity contribution without payment is included, if identified, in the form either of real or of financial assets. In the event that domestic stocks acquired by non-resident investors through secondary markets are singled out, they are reallocated from portfolio investment to direct investment, where relevant. In practice, however, this kind of flow is only identified when huge amounts relating to a single company are involved.

A geographical breakdown is also available based on the first country of destination of the flows for French direct investment abroad and on the first country of origin of the flows for foreign direct investment in France.

Should a change of ownership of a resident company from a non-resident to another non-resident direct investor be evidenced by the survey, the change would be recorded in the FDI stocks, but usually not in the corresponding b.o.p. flows.

Transactions settled via an exchange of shares are recorded when this exchange takes place. The evaluation of such transactions is equal to the market price of the resident shares concerned.
7.2 DEFINITION

According to the recommendations of the BPM5, the French b.o.p. uses the criterion of 10% or more ownership of the equity of an enterprise to define a direct investment relationship. Moreover, in accordance with the IMF and the OECD Benchmark definitions, all inter-company financial flows (except commercial credits between affiliates and transfers of securities between affiliates) have to be recorded under the direct investment item as soon as a direct investment relationship has been established. As a consequence, the notion of direct investment includes all operations concerning equity capital, reinvested earnings and other operations (long-term and short-term loans, deposits, etc.). Furthermore, all cross-border transactions in real estate are covered.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

France fully applies the directional principle to record long-term loans between affiliated enterprises. For all other transactions (in particular, short-term loans), the directional principle is partially used.

France is not in a position to record inter-company trade credits in the direct investment item. Indeed, the trade-credit survey carried out by the Banque de France does not identify separately trade credits extended to/received from affiliated and non-affiliated enterprises. They are all in the other investment item.

Furthermore, inter-company flows on securities (equities below the threshold of 10% and all flows on bonds subscribed by affiliates) are recorded under the portfolio investment item.

7.4 GAPS

None.

7.5 INTENDED HARMONISATION

The introduction of the directional principle for the recording of all direct investment flows is difficult and different methods are under consideration at the Banque de France.

7.6 ESTIMATION METHODS

The Banque de France does not use estimates, except in the case of reinvested earnings in the current year and – in some cases – in the previous year (see Sub-section 5.1.2).

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Securities transactions between residents and non-residents are reported on a security-by-security basis, using the ISIN code. The respondents have to report direct and portfolio investment transactions (with the 10% threshold) separately. For each security, the securities database contains the ISIN code, which makes it possible to access the database and to check the flows reported by the respondents on a security-by-security basis. Moreover, all b.o.p. breakdowns are made using the securities database which contains all the elements necessary for b.o.p. treatment (nature of the instrument; country of residence of the issuer, which allows the breakdown between French and foreign securities; sector of the resident issuer etc.) as well as other data (quotation, currency of issue, date of issue and reimbursement for most debt securities, market of issue: domestic or international, etc.). Banks have full responsibility for reporting securities transactions directly on their own account and indirectly on behalf of their clients. These flows are compiled in the b.o.p. using a Monthly Securities Statement. The Monthly Securities Statement is drawn up on a security-by-security basis, using the ISIN code. Apart from the sectoral breakdown (see below), all the data necessary to elaborate the portfolio flows are obtained from this statement.

The banks report flows on French and foreign securities separately, but this breakdown is checked against the securities database maintained by the Banque de France.
The monthly securities statements on French and foreign securities are broken down by issues, secondary market and repayments.

The geographical breakdown of foreign securities by country of residence of the issuer is also effected via the securities database as well as the breakdown by instrument (equity, bond, etc.). On the contrary, the monthly statement provides the country counterpart of the transactions for the liability side. Indeed, the geographical allocation criteria are the debtor principle for assets and the transactor principle (first known counterpart) for liabilities.

For French securities, the sectoral breakdown of the flows is made on a monthly basis using the securities database, which indicates the issuing sector for each security.

For foreign securities – irrespective of the periodicity (month, quarter or year) – the sectoral breakdown between the resident holders (Monetary Financial Institutions and other sectors) is made through changes in banking balance sheets and reports from monetary mutual funds.

As required by international recommendations, transactions associated with repurchase agreements and bond lending are not recorded as portfolio investment flows. If these transactions are made against “cash”, they are recorded under the other investment item.

In addition, the press and declarations from the resident enterprises are used to check the reports by banks on new issues by French residents on the international markets.

No difference is made in recording practice with regard to the nature of the non-resident counterpart (financial centre, lead manager, etc.), the country of residence of the non-resident counterpart with which the security is negotiated, the currency of payment and the place of payment.

The Banque de France would expect significant benefits to be derived from the setting-up of a centralised securities database:

(i) cost effectiveness at the national and at the European level;

(ii) fully harmonised data for the treatment of portfolio investment (i.e. no difference in the classification of bonds and money market instruments for a given security; fully harmonised country of residence of the issuer and, as a consequence, a fully harmonised breakdown into euro area and non-euro area securities).

8.2 DEFINITION

All securities, irrespective of their nature (equity, debt instrument, etc.), are covered by recording, except for securities which cannot be traded without the agreement of the issuer.

The flows have to be reported at the time of the payment and not when the transactions take place.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None, except for flows of affiliates’ securities which should be excluded from portfolio investment and recorded under direct investment. Service charges, fees and commissions are included in portfolio investment flows when French or foreign securities are bought by non-residents; they are excluded when French or foreign securities are sold by non-residents. Offsetting entries for investment income are not recorded.

8.4 GAPS

No monthly or quarterly gaps.

8.5 INTENDED HARMONISATION

Full implementation of the accruals principle for interest payments.
8.6 ESTIMATION METHODS

There are no quarterly estimates for the portfolio investment account.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Flows of derivatives are recorded from monthly records of payments, regardless of the resident sector involved. The compilation system does not allow any sectoral distinctions. Flows of interest swaps, premiums on options, futures and margins are compiled. At present it is not possible to distinguish between option-style and future-style derivatives.

Gross data (debits and credits) are, in principle, available; swaps – including interest rate swaps – are recorded on a gross basis and netted afterwards. There is no recording of premiums on the exercise date.

The geographical allocation criteria depend on the individual instrument:

(i) premiums: first known counterpart country in the case of French issuers and country of residence of the issuer in the case of foreign issuers (similar to the portfolio account). Investigations do not go beyond the clearing house. For example, a premium negotiated in London with the London International Financial Futures Exchange (LIFFE) is deemed to have been “issued” by the LIFFE (country: United Kingdom);

(ii) margins: the transactor principle;

(iii) interest on swaps: see (i) above.

9.2 DEFINITIONS

The Banque de France complies with the recommendations of the BPM5 and the harmonisation proposals of the Working Group on Balance of Payments and External Reserves Statistics. Financial derivatives are recorded under a specific item. The net stream of settlement flows associated with interest rate derivatives is recorded under financial derivatives.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Monthly estimates are based on transactions already recorded, plus staff expertise.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2).

The Banque de France uses actual flows, recorded using CRPs, except in the case of banks, non-depository financial intermediaries and government (flows are derived from stock data). Both a sectoral and an instrumental breakdown are available. The maturity breakdown is made on the basis of the initial maturity (up to one year and more than one year), except for stand-by credits, for which the breakdown is based on the maturity of the drawing.

Trade credits are recorded on a monthly basis.

Historical data prior to 1996 are distorted owing to a methodological change in the recording of money market instruments, which
were transferred from the other investment item to the portfolio investment item.

Flows for the MFI sector are derived as adjusted changes from special b.o.p. stock reports which are consistent with MFIs’ balance sheet data at the beginning and end of the reference period.

Data on transactions which were carried out through TARGET are transmitted by the Accounting Department of the Banque de France and are only used for the global calculation of “other investment/monetary authorities”. Since December 2000, flows with other ESCB countries have been recorded on a net basis and the net figure is recorded as an asset or a liability vis-à-vis the ECB, depending of the sign.

10.2 DEFINITION

In principle, the Banque de France complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics.

All short-term flows between affiliates except trade credits are recorded under direct investment (see the BPM5) and not under other investment. Foreign currency banknotes and coins are included.

Bond lending and repos are included provided that there is a monetary counterpart; otherwise there is no record in the French b.o.p. at all. Genuine repurchase agreements conducted at a fixed price on a fixed date predominate, but only marginally. Compared with lending against collateral, repo activities play a far more significant role. Repo activities usually mature within a month.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

Commercial credits (trade credits) between affiliates are not identified separately and are included under other investment. There is no deviation from the recommended treatment of repo activities. The recording of financial leasing is not compliant with the BPM5 in all cases.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

There are no quarterly estimates for the other investment account.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2).

11.2 DEFINITION

The presentation follows the recommendations made in the BPM5. Since January 1999, data on France’s reserves have been compiled in accordance with the IMF Template on International Reserves and foreign currency liquidity.

An instrumental breakdown is available on a monthly basis. In accordance with the ECB recommendations financial derivatives are recorded separately and on a net basis. Gold swaps are recorded as repos.

With regard to the use of market prices, recording is in line with the principle laid down in the ECB recommendations. The calculation of flows for the b.o.p. is based on the valuation of changes in currencies at average exchange rates recorded in the period (average of daily exchange rates). This proxy was accepted by the Working Group for the harmonised calculation of b.o.p. flows.
11.3 Deviations from agreed definitions

None.

11.4 Gaps

None.

11.5 Intended harmonisation

None.

12 International investment position

12.1 Specific features of data collection

The collection system of the Banque de France is based on pure stock data stemming from surveys. The following data sources are taken into account:

(i) direct investment: surveys of resident firms;

(ii) portfolio investment: surveys of resident banks (own portfolio and portfolio held on the account of their clients) and, for the collection of money market instruments, of a very limited number of firms; data from Clearstream and Euroclear are also used. It should be noted that the liabilities vis-à-vis non-residents on bonds issued by French residents on international markets are calculated by subtracting the amount held by residents (reported by the resident banks) from the total amount issued (available in the bond database managed by the Banque de France);

(iii) derivatives: banks balance sheets;

(iv) other investment:
  – monetary authorities and general government sector: reporting from the entities included in these categories;
  – MFIs: banks balance sheets and reports from the monetary mutual funds;
  – other sectors: surveys of firms, collection of stocks for non-depository financial intermediaries and data from the BIS to calculate household external assets; and
  – trade credits.

While the sectoral breakdown can be provided without any problem, the availability of a geographical breakdown differs among items:

(i) direct investment: available for equity capital and reinvested earnings, but not for all loans;

(ii) portfolio investment: available for assets, but not for liabilities (possible improvement as a result of the use of the IMF Co-ordinated Portfolio Investment Survey);

(iii) other investment: the geographical breakdown is not fully available;

(iv) derivatives: only intra-euro area/extra-euro area breakdown is available.

Due to the delays required for the availability of final stocks, estimates are calculated six months after the end of the reference period, except in the case of trade credits, the positions of the MFI, non-monetary mutual fund and non-depository financial intermediary sectors, and reserve assets, for which stocks are available earlier.

France participated in the IMF Co-ordinated Portfolio Investment Survey in 1997, 2001 and 2002, and will participate in the next exercises by providing data based on stock surveys, primarily from securities accounts.

I.i.p. data are used as inputs for the elaboration of the Rest of the World account in the National Accounts.
12.2 DEFINITIONS

12.2.1 GENERAL
The coverage and the concept are in line with the financial account of the quarterly/annual b.o.p. flows. Exceptions relate to the portfolio investment position of non-banks, where only securities held in securities accounts with resident banks are compiled, together with the information from Clearstream or Euroclear.

The reconciliation exercise works as follows:

Previous stock (revalued at new prices and currencies) + flows for the year (revalued) + other adjustments (difference not accounted for by price and currency changes) = new stock

The following valuation principles are applied:

(i) direct investment: for equity capital, book values; market values both for listed and unlisted shares are also available on a global basis, but not by country or by firm;

(ii) portfolio investment: market value;

(iii) other investment: book values (which are supposed to be equal to the market values in this case).

12.2.2 DIRECT INVESTMENT
As for flows, the notion of direct investment includes all operations relating to equity capital, reinvested earnings and other operations (long-term and short-term loans, etc.).

For French direct investment abroad, data on equity capital and reinvested earnings are collected once a year, mostly by Banque de France branches, which gather information on companies located within their respective area. The direct investor has to indicate to the Banque de France the name of the company located abroad, the percentage of its stake and the accounting data necessary for the outstanding amount to be calculated.

For inward foreign direct investment stocks in France, the compilation is made in two stages: first, direct investment enterprises are identified by using data from different sources, namely a commercial data provider, the database of the Banking Commission, the database on companies managed by the Banque de France at the Enterprises Directorate and data collected through the compilation of b.o.p. flows; second, stock data on direct investment enterprises are compiled from accounting data provided by the aforementioned sources.

In both cases, stocks of equity capital are valued on the basis of the book value. Then, estimations are made in order to value the stock at market value. A full geographical breakdown is available for the book values.

As far as other operations are concerned, the stocks are collected directly from enterprises via an annual survey. No geographical allocation is available for these operations.

12.2.3 PORTFOLIO INVESTMENT
For portfolio investment stocks, the resident banks report on their own portfolio and on the portfolio they hold in securities’ accounts for the account of their clients.

The reports are made on a security-by-security basis with the indication of the ISIN code. Thanks to the ISIN code and the security database, it is possible to identify the instrument, the sector of the issuer, the country of residence of the issuer, the currency of issue, etc.

Stocks are valued at market prices.

On the assets side, geographical allocation is effected according to the debtor principle (country of residence of the issuer). On the liabilities side, no geographical allocation is available.

On both the assets side and the liabilities side, a sectoral breakdown is available.
Moreover, resident banks send additional information on temporary sales or purchases of securities, so that the impact of these operations on stocks can be corrected. As a consequence, the reconciliation between flows and stocks is ensured.

12.2.4 FINANCIAL DERIVATIVES
Data are recorded on a gross basis (assets/liabilities). Valuation at market prices is required for options and futures, but not for swaps, forwards, and other derivatives (derived from off-balance sheets).

12.2.5 OTHER INVESTMENT
See Sub-section 12.1.

12.2.6 RESERVE ASSETS
Positions are valued in line with the bookkeeping practice of revaluing reserve assets on a monthly basis. This means that amounts relating to revaluation are included in reported positions and market prices are used. The same applies for gold.

No major discrepancies are encountered when compiling reserve assets from accounting balance sheets.

The adjustment of data from accounting systems to produce data consistent with the b.o.p./i.i.p. methodology is carried out by means of quarterly consistency checks based on expertise and analysis.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

12.4 GAPS
There is no sectoral breakdown for financial derivatives and no geographical allocation for the liabilities side of portfolio investment stocks.

12.5 INTENDED HARMONISATION
None.

12.6 ESTIMATION METHODS
None.

13 ADMINISTRATION

13.1 TITLES OF PUBLICATIONS
“Rapport adressé à M. le Président de la République et au Parlement” (annual).

“Bulletin de la Banque de France” (monthly).

13.2 CONTRIBUTORS
This country information was drafted by the ECB’s External Statistics Division and subsequently amended and agreed with France. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to France should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Central Statistics Office (CSO) is the national office responsible for compiling and publishing official balance of payments (b.o.p.) and international investment position (i.i.p.) statistics for Ireland.

Quarterly b.o.p. data compilation in Ireland is based on statutory CSO statistical surveys, combined with administrative data, and is closely integrated in the CSO with the compilation of the national accounts. Responsibility for compilation of monthly b.o.p. estimates was assumed by the CSO in early 2002. i.i.p. statistics are collected by the CSO as part of ongoing quarterly b.o.p. collection arrangements. Annual data have been supplied to the ECB in recent years and were first published nationally by the CSO in 2002. During 2003, a new quarterly series on external debt statistics was published and new annual national statistical releases were introduced giving new geographical detail on foreign direct investment (flows and stocks) and on Irish resident holdings of foreign portfolio securities. Preparations have also been completed for the production of quarterly i.i.p. data for the ECB and other users, which should start by end-2004.

There is very close ongoing liaison between the CSO and the Central Bank and Financial Services Authority of Ireland (i.e., CBFSAI) concerning compilation of the results generally. This is particularly so in relation to the monthly b.o.p. estimates as the CBFSAI, which formerly compiled these estimates, provides the basic information concerning credit institutions and collective investment institutions (CIIs) to the CSO for their preparation.

2.2 LEGISLATIVE PROVISIONS

(i) CSO

B.o.p. data are collected by the CSO under the Statistics (Balance of Payments) Order of 2001 (Statutory Instrument No 542 of 2001; Presentation No 10863) issued under the Statistics Act of 1993 (Number 21 of 1993), which makes the provision of data for the purpose of compiling b.o.p. statistics compulsory.

The Ministerial Order for the b.o.p. specifies in broad terms the kind of information which is required and allows for the collection of data by various means, both from b.o.p. transactors and from agents conducting transactions of relevance to the b.o.p. on behalf of customers. It essentially provides for a comprehensive b.o.p. data collection system, including the acquisition of information on the transactions and activities of entities acting on behalf of clients.

In addition, the European Communities (Statistics) Regulations, 1999 (Statutory Instrument No 177 of 1999; Presentation No 7396) were introduced in June 1999 in order to permit the CSO to meet obligations under Council Regulation (EC) No 2533/98 of 23 November 1998.

(ii) CBFSAI

The legal authority for all statistics collected, compiled and published by the CBFSAI, including those relating to the b.o.p., is derived from legislation relating to the CBFSAI (Central Bank Acts of 1942, 1945, and 1946).

1 The Central Bank of Ireland was restructured and renamed as the Central Bank and Financial Services Authority of Ireland (CBFSAI) on 1 May 2003. The abbreviation “CBFSAI” is used hereafter in this chapter to refer to the institution both before and after 1 May 2003.

2.3 INTERNAL ORGANISATION

(i) General
The first formal written agreement between the CBFSAI and the CSO was completed and signed by the Governor of the CBFSAI and the Director General of the CSO in February 2002. It was reviewed and amended in 2004 primarily to address arrangements between the two institutions for the implementation by the CSO of a security-by-security collection system to facilitate compilation of portfolio investment statistics for the ECB. The agreement covers the interactions between the two organisations concerning b.o.p./i.i.p. matters in considerable detail. Both institutions have close formal and informal working relationships as regards the general compilation and interpretation of b.o.p./i.i.p. results and in relation to interactions with the ECB. A Statistical Liaison Committee comprising representatives from both institutions has existed since 1995. Its purpose is to enable the discussion of items relevant to both institutions, not only in terms of the b.o.p., but also in relation to the relevant aspects of the national accounts and the financial accounts.

The CBFSAI provides valuable assistance to the CSO in a number of areas connected to b.o.p. and i.i.p. compilation. These include close liaison between the CBFSAI and the CSO in checking the consistency of quarterly b.o.p data with banking statistics data, the supply of monthly banking statistics and reserve assets data as well as the data on transactions of CIIs and money market funds which are used as inputs in compiling monthly b.o.p. estimates. In addition, the CBFSAI provides the CSO with information which facilitates the CSO’s maintenance of its enterprise register, particularly for enterprises engaged in internationally traded financial services, including those operating in the International Financial Services Centre (IFSC). The CBFSAI also liaises closely with the CSO on b.o.p./i.i.p.-related matters at an international level (i.e. concerning the ECB, Eurostat, IMF, etc.). It also attends relevant international b.o.p. meetings.

(ii) CSO
B.o.p. and i.i.p. compilation in the CSO is the joint responsibility of two divisions within the Directorate Macroeconomic Statistics. In early 2002, the original Balance of Payments Division was reorganised into two separate but closely cooperating divisions, namely the Balance of Payments and Financial Sector (BOP&FS) Division and the Balance of Payments Analysis and Dissemination (BOPA&D) Division. The BOP&FS Division is responsible for data collection and processing. This involves the maintenance of the survey management system (or SMS, which concerns register maintenance and survey administration), the conduct of the surveys, data capture and processing for quarterly b.o.p and annual i.i.p. compilation. The BOPA&D Division is responsible for the analysis, publication and dissemination of the quarterly results internally, nationally and internationally; it also produces the monthly b.o.p. estimates required by the ECB. The total number of staff (full-time equivalents) is 35. Of these, 28 are in the BOP&FS Division and 7 in the BOPA&D Division. In all, 12 staff are responsible for the managerial, administrative and technical aspects of the b.o.p. system, as well as for developmental aspects. The remaining 23 staff are

---

1 The International Financial Services Centre (IFSC) in Dublin was established under specific legislation in 1987 with a view to creating a significant international financial services industry for Ireland. Tax advantages are available to companies located in the IFSC and the types of activities which qualified under the licensing and certification process include fund management, insurance, treasury management, banking and asset financing, as well as securities trading and brokerage. This licensing and certification process has been discontinued for new stand-alone projects since 1 January 2000, but still applies to “additional” projects under existing licences.
principally involved in the ongoing issue and receipt of survey forms, data processing, routine respondent contacts and the preparation of results for internal examination, national publication and transmission to international organisations. Further improvements are being made on an ongoing basis and the new system is essentially capable of meeting the national and international b.o.p. and i.i.p. data requirements.

An integrated computer processing system handles all aspects of b.o.p./i.i.p. compilation, i.e. survey management, data collection, capture and processing, results generation and dissemination. This system uses relational database technology and forms part of the new CSO-wide integrated IT processing facility now being installed.

(iii) CBFSAI
The equivalent of three full-time staff members are involved in b.o.p.-related tasks, mainly comprising the compilation of data required by the CSO, the provision of the CBFSAI’s own b.o.p. estimates and forecasts, and the treatment of aspects of b.o.p. development in consultation with the CSO.

2.4 EXTERNAL COOPERATION

(i) CSO
The CSO maintains close contact on an ongoing basis with a number of government departments (i.e., the Departments of the Taoiseach, i.e. the Prime Minister, Finance, Enterprise, Trade and Employment, Agriculture and Food, Marine and Natural Resources, Defence, and Foreign Affairs) and their agencies, as well as with the CBFSAI, to obtain information necessary for the compilation of the b.o.p. These contacts serve a variety of other purposes covering, for example, consultation for information on statistical policy changes introduced by the CSO, requests for information of a quantitative (i.e. transactions, positions, etc.) or qualitative (i.e. for statistical register needs) nature. In addition, the relevant authorities are also contacted when necessary in relation to the CSO’s interactions with those entities they supervise or regulate.

The support of the appropriate authorities, together with that of the relevant industry associations, is critical in obtaining the cooperation of data providers in order to maintain and, where possible, to improve the quality and timeliness of the statistics produced.

(ii) CBFSAI
As described in the introduction, the CBFSAI liaises closely with the CSO on the compilation of monthly b.o.p. estimates, providing much of the information required for the b.o.p. financial account. The CBFSAI has improved the level of detail provided for MFIs (including money market funds) and CIIs during 2004. The CBFSAI also provides monthly data to the CSO on commercial paper issues and redemptions by non-MFIs. It also assists in the quality checking of b.o.p. information and supplies national data on reserve assets and foreign currency liquidity to the ECB.

2.5 USERS

(i) CSO
Apart from the publication of its quarterly b.o.p. release, the CSO provides further details and analyses to a number of specialist users. The CSO supplies b.o.p. data to the Department of Finance and to the Department of Enterprise, Trade and Employment. As a result of its role in monitoring Ireland’s economic performance, the Department of Finance is interested in all aspects of the b.o.p. The main focus of the Department of Enterprise, Trade and Employment is on industrial development in the manufacturing and services sectors. This Department and the Industrial Development Authority (IDA), an
agency operating under its aegis and involved in attracting foreign direct investment to Ireland, are particularly interested in the direct investment aspects of the b.o.p., as well as in the data on merchandise and services. Data are also supplied to stockbrokers, analysts in the field of economic and social research as well as to universities. The National Accounts Division also uses b.o.p. results internally within the CSO.

The CSO supplies data to international organisations such as the ECB, the European Commission (Eurostat), the IMF and the OECD.

(ii) CBFSAI
The b.o.p. estimates and forecasts that are prepared by the CBFSAI are based largely on official b.o.p. data published by the CSO. They do, however, take account of more recent information collected from the banking sector, government departments and the National Treasury Management Agency (NTMA).

3 STATISTICAL SYSTEM
3.1 TYPE OF COLLECTION SYSTEM

As mentioned above, the quarterly b.o.p. compilation system is based on surveys and administrative data and is closely integrated with the compilation of the “rest of the world” (ROW) account in the national accounts. The system was designed to meet the requirements (including those relating to i.i.p. data) of the fifth edition of the IMF Balance of Payments Manual (BPM5), as well as those of the ECB, Eurostat and the OECD.

The monthly estimates which are prepared by the CSO largely rely on data collected by both the CSO and the CBFSAI. A modelling approach is used for elements of the current account. The portfolio and other investment elements of the financial account are based primarily on statistical and regulatory data collected by the CBFSAI from credit institutions and from CIIIs. This information is supplemented by additional data collection by the CSO for direct, portfolio and other investment. Data on transactions of the monetary authority sector are also provided by the CBFSAI.

The statutory quarterly collection system for financial services enterprises requires transaction data on services, income and transfers. Transaction and position data (along with the reconciliation items) are required for assets and liabilities. The transaction details (i.e. services and income items and instrument breakdowns) necessary to meet BPM5 requirements are obtained – see Sub-section 3.2 on reporting agents for a description of CSO data requirements – from non-IFSC credit institutions. Sectoral and geographical details are also provided. In order to reduce the reporting burden, companies having lower levels of activity report on the same basis annually.

Manufacturing and non-financial services companies are required to supply b.o.p. current, capital and financial account data on a transactions basis each quarter, along with quarterly stocks. Geographical and sectoral information is also collected. Smaller companies report all this information annually.

Information on merchandise trade and travel statistics are obtained from the relevant compiling divisions within the CSO. Administrative data from government departments (or their agencies) and from the CBFSAI are also used.

Apart from data obtained from direct collection, internal CSO or external administrative sources, ancillary support information to assist with the compilation of results is also used. This largely consists of: Irish Stock Exchange listings; Reuters market information concerning equities and bonds, currency exchange and interest rates; CBFSAI statistics; and industry...
association or any other relevant statistical information. Qualitative information useful for statistical register purposes is obtained from the CSO Central Business Register (CBR) and from other sources. In addition, information from the Department of Finance, the CBFSAI and the Companies Registration Office (CRO) is used in the maintenance of the b.o.p. financial services enterprises section of the register. Individual company data from the internal CSO merchandise trade statistics database, along with any useful information from newspapers, periodicals, etc., are used as inputs into the statistical register system. Securities databases are not used, as the portfolio investment data are compiled on an end-investor, aggregate basis.

3.2 REPORTING AGENTS

(i) CSO

A. Companies. The type of survey form issued to a company depends upon the type of company. A short description of b.o.p. surveys follows.

I. Manufacturing and non-financial services companies

Survey of foreign assets and liabilities – quarterly and annual (BOP40):

This survey requests quarterly data on foreign assets and liabilities (flows, stocks and reconciliation items) as well as on related income transactions from companies incorporated in Ireland and Irish branches of foreign companies. It is designed to summarise all the foreign transactions of the resident parts of Irish groups, Irish companies and Irish branches. All foreign assets and liabilities have to be reported, including investment in overseas companies by any part of a group, Irish company or Irish branch which is resident in Ireland. From the start of 2004 this survey was expanded to include resident-resident transactions and positions to facilitate compilation of the national accounts and the financial accounts. Sectoral and geographical detail are also required. Smaller companies report on the same basis annually.

Respondents: the BOP40 is completed by Irish companies and Irish branches of foreign companies which are engaged in manufacturing or the supply of non-financial services and which have foreign assets or liabilities.

Survey of international trade in services and royalties – quarterly and annual (BOP10):

This survey requests information on transactions with non-residents concerning the sale/purchase of services (including royalties, copyrights, licences, etc.). From the start of 2004 this survey was also expanded to include resident-resident service transactions to facilitate compilation of the national accounts. Geographical detail is requested. The information obtained identifies the outright purchase/sale of copyrights, patents, licences, etc. Smaller companies report on the same basis annually.

Respondents: manufacturing and non-financial services companies.

II. IFSC and non-IFSC financial services companies

Quarterly surveys of IFSC enterprises, which were introduced in 1998, are very comprehensive and designed to collect information relevant to b.o.p./i.i.p. compilation and for wider national accounts purposes. The surveys are customised on the basis of the main types of IFSC activity, namely: (a) collective investment schemes (including money market funds which now are identified separately for MFI statistical purposes); (b) insurance (distinguishing between life and non-life enterprises) and reinsurance; (c) stand-alone treasury activity; and (d) banking, asset financing, securities

trading, and agency and captive treasury activities. The larger companies are required to return the information each quarter, while the smaller ones make annual returns. Administration and management companies as well as custodians and trustee companies are also included; the principal b.o.p. interest in these latter “service provider” companies concerns transactions in service fees, although full b.o.p./i.i.p. details are required. The system is designed to ensure complete coverage of all IFSC activity over the full year.

From a b.o.p./i.i.p. point of view, the information required is essentially the same for all the surveys and covers services, income flows, assets and liabilities and the reconciliation of positions and flows along with the necessary geographical detail. The various surveys are:

– survey of collective investment schemes – quarterly and annual (BOP41);
– survey of IFSC non-life insurance/reinsurance – quarterly and annual (BOP42);
– survey of IFSC life insurance/reinsurance – quarterly and annual (BOP43);
– survey of IFSC stand-alone treasury – quarterly and annual (BOP44); and
– survey of IFSC banks, asset finance and securities trading companies, agency and captive treasury companies and other related financial services companies – quarterly and annual (BOP45).

Respondents: IFSC administrative or management companies that provide financial services to collective investment schemes, captive investment (including insurance/reinsurance) companies and agency and captive treasury companies. Stand-alone companies (e.g. banks, treasury companies) are also covered.

The data collection requirements for non-IFSC entities are designed to meet the needs of both the b.o.p. and the national accounts. As a result, the demands on Irish resident investment managers were expanded in 1998 to cover both assets and liabilities, with a breakdown between resident and non-resident investments (see the description of the BOP30 survey below). In addition, the activities of life and general insurance companies and credit institutions are covered by the collection system. The aim is to achieve complete coverage. As for IFSC operations, the larger companies are required to return the information each quarter, while the smaller companies make annual returns. Financial services companies which provide other types of services and which conduct transactions relevant to the b.o.p. will, depending on materiality, be incorporated into the system as it develops. At present, the activities of these companies, in aggregate, are insignificant from a b.o.p. perspective. The specific data collection arrangements are described below.

Survey of portfolio investment by Irish investment managers – quarterly and annual (BOP30):
This survey is addressed to investment managers resident in Ireland and requests information on own account and client account investments in Irish and foreign securities by resident and non-resident investors. Geographical detail and sectoral information are requested. The form is also addressed to stockbrokers to obtain data relevant to the b.o.p. It is hoped that the information returned will result in a better coverage of the household sector.

Respondents: non-IFSC Irish resident portfolio investment managers and stockbrokers.
Survey of insurance companies – quarterly and Annual (BOP46):
Information similar to that required from IFSC insurance companies is required for all three accounts of the b.o.p. Quarterly (and, for smaller companies, annual) position data as well as data needed to reconcile flows and positions are required. Geographical detail is also required.

Respondents: all non-IFSC insurance companies incorporated in Ireland as well as Irish branches of foreign companies.

CSO data requirements for credit institutions – quarterly and annual (BOP50):
As from the start of 2001 a full b.o.p./i.i.p. reporting system for banks (MFIs) replaced the earlier three-year interim arrangement.

The information required quarterly covers the non-resident services and income flows of these MFIs, as well as non-resident assets and liabilities transactions and positions and the reconciliation of positions and flows by reporting valuation and other changes. Direct, portfolio, financial derivatives and other investment categories are identified separately. Geographical detail is also supplied. The smaller MFIs report on the same basis annually.

Respondents: Irish resident non-IFSC credit institutions (MFIs), including Irish branches and subsidiaries of foreign companies.

B. Government sector. Information is provided by the various government departments, e.g. the Department of Agriculture and Food (Common Agricultural Policy data), the Department of Finance (amounts received from the Structural and Cohesion Funds of the EU and own contributions to the EU; listings of

IFSC licensed companies for b.o.p. register purposes), the Department of Social, Community and Family Affairs (data on pension payments abroad), the Department of Defence (data on military assistance to UN peace-keeping) and the Department of Foreign Affairs (foreign embassies in Ireland and Irish embassies abroad).

C. Other sections of the CSO. Foreign merchandise trade data (collected via Intrastat and the customs authorities) are provided by the Trade Statistics Division of the CSO. The BOP Division adjusts these data on a b.o.p. merchandise basis (see Subsection 4.2 below). Data on tourism and travel are provided by the Tourism and Transport Section of the CSO in Cork, which conducts passenger and country-of-residence surveys of travellers.

D. Official sector. As described above, the CBFSAI provides data on official external reserves as well as data on the CBFSAI’s portfolio and other investment assets and liabilities (including TARGET transactions and positions). The National Treasury Management Agency (NTMA) provides data on the Irish Government’s holdings of foreign assets (including investments made by the National Pensions Reserve Fund) and on the bulk of the non-resident part of the national debt; data on certain portfolio debt of the Government are provided by the CBFSAI.

(ii) CBFSAI

A. Credit institutions. All credit institutions, including IFSC banks, are required to report to the CBFSAI on a monthly “Resident Offices Return” (a balance sheet return with resident and non-resident columns for assets and liabilities). This reporting takes place within the framework of bank statistics reporting, rather than reporting for b.o.p. purposes.
**B. Government sector.** The various central government departments and the NTMA also supply information similar to that supplied to the CSO. Euroclear also provides monthly data to the CBFSAI on non-resident holdings of Irish government securities.

**C. Collective investment institutions.** These institutions are required to report to the CBFSAI each month on the purchase and redemption of units in the relevant schemes as well as on their net asset values.

**D. Other financial institutions.** All entities issuing commercial paper that do not hold a banking licence report monthly to the CBFSAI on issues, redemptions and outstanding volumes.

### 3.3 THRESHOLDS

There is no general simplification threshold for reporting, but – for financial services companies – materiality criteria are applied to determine the frequency (quarterly or annual) of the returns required.

### 3.4 AVAILABILITY OF DATA (QUARTERLY/ANNUAL B.O.P.)

The current and capital account items are available on a BPM5 basis and with geographical detail.

Within the financial account, a functional breakdown for investment into direct, portfolio, financial derivatives and other investment, as specified by the ECB, is available. A geographical breakdown is available, in addition to the required sectoral breakdown.

### 3.5 TIMELINESS

Forms are issued at the beginning of the week following the end of the reference quarter or year, and reporting agents have 21 days to respond. While many reporting agents are good respondents, a number are not. The speed and quality of response of the latter have caused ongoing problems. Matters have gradually improved, however, following ongoing efforts within the CSO to address these difficulties on three fronts. First, unreasonable reporting burdens are being reduced or eliminated wherever possible (e.g. by designing more user-friendly forms and instructions and by reducing the reporting frequency for less active companies). Second, a more vigorous follow-up is conducted using telephone, e-mail and written contact prior to and after the reporting deadline, and the number of company visits has been increased (but this policy, while being very worthwhile, is extremely resource demanding). Third, the CSO is continuing with its increasingly rigorous policy of legal enforcement in cases of seriously late response or non-response. It is encouraging that notification of the initiation of legal proceedings against sub-standard respondents tends to result in the required information being returned. Bringing about further improvement in response is an ongoing, but resource-consuming task.

### 3.6 COMPILATION FREQUENCY

Official Irish b.o.p. results (with geographical detail) are currently published on a quarterly/annual basis only. Broad unofficial estimates of the monthly items are also compiled by the CSO and supplied to the ECB via the CBFSAI. While some additional data collection has been introduced, there are no plans to introduce a full monthly b.o.p. collection system to cover all the items required. A modelling approach is being used for many of the current account items and it is intended to improve this technique where possible. Data on the principal official transfers are collected monthly by the CSO. As regards the financial account, much of the portfolio and other investment data is compiled from banking and collective investment information collected monthly by the CBFSAI. The CBFSAI also provides the b.o.p. data on external reserves, along with other own account transactions with non-residents. The CSO now uses published information on start-ups and closures, and on
mergers and acquisitions, as a means of improving the direct investment estimates. It is also involved in the project sponsored by the ECB to examine the feasibility of using the proposed “common form” for multinational companies for collecting b.o.p./i.i.p. data. The CSO also collects monthly data from the NTMA on the foreign element of government debt and on foreign investments made by the recently established National Pensions Reserve Fund. In order to improve the monthly estimates for direct, portfolio and other investment further, the CSO has expanded its data collection from certain large financial enterprises.

3.7 DATA CONTROLS

The CSO operates an integrated computer processing system (using Sybase relational database technology). A standard processing approach applies to all surveys and administrative data. The system was designed to streamline the entire operation and provides a more powerful pre-publication analysis tool than was formerly available.

On receipt in the CSO, all returns in paper form are manually checked for obvious reporting errors by the person responsible for each particular company. If no errors are apparent, the data are manually keyed into the Sybase database and undergo various automated consistency and plausibility data checks. Where data are returned in electronic form, they are imported through a bulk loading process into the database and are subjected to a similar checking procedure. If the data fail the more important checks, the CSO contacts the company concerned to query the data and make any corrections necessary. Estimates are made for partial or complete non-responses using either automated or manual imputation procedures. This facility is largely applied only to non-returning smaller companies surveyed, as the larger companies are pursued until the data are supplied. If this is unsuccessful, estimates are made. Once verified and further processed as necessary, the data from all surveys are summarised. The various results output tables required are then individually transferred into an Excel spreadsheet from which the hard-copy publication tables or electronic data transmission messages in GESMES/CB format are produced. Prior to publication, some further manual checking is also carried out on the consistency of the b.o.p. results with information available elsewhere, e.g. financial trade data, production statistics and profits data. More in-depth data quality checks are conducted annually against data available to the National Accounts Division.

Apart from this general checking, the Data Consistency Unit (part of National Accounts Division) of the CSO carries out checks on the consistency of quarterly and annual data returned by individual large manufacturing and non-financial services companies to various divisions within the CSO including the BOP Division. The Data Consistency Unit liaises on an ongoing basis with these divisions and with any company concerned to determine the reasons for any significant discrepancy or inconsistency. In an ongoing effort to improve data quality the Data Consistency Unit operates a programme of company visits and liaison so that the CSO becomes aware as early as possible of any material change in companies’ operational, accounting or reporting practices affecting the data returned. BOP personnel often participate in these visits and also make visits independently as and when specific b.o.p. problems need to be resolved. As regards financial enterprises, the quality analyses undertaken by the CSO involve comparison of its results with aggregate data available from other sources. These include representative associations for insurance companies, pension funds, CIIs, government departments, etc. In addition, the CSO and the CBFSAI undertake a detailed reconciliation of money and banking statistics and b.o.p./i.i.p. statistics for MFIs (including money market funds) each quarter. Work is also ongoing to reconcile differences between b.o.p./i.i.p. data and regulatory data relating to CIIs and other financial intermediaries (OFIs). The extent of this contact has increased following the transfer of
responsibility for production of the monthly b.o.p. estimates from the CBFSAI to the CSO in early 2002 and given the CBFSAI’s major data input.

3.8 REVISION POLICY

The CSO’s general revision policy for quarterly data is to incorporate changes when the data for the calendar year are being produced, i.e. the following spring/summer. However, the policy is flexible and significant changes to previously published figures are incorporated on a quarterly basis. In addition, and in the interest of publication consistency, smaller revisions are included in cases where data sourced from and published by other divisions of the CSO also appear as separate items in the b.o.p. release.

In the case of monthly b.o.p. estimates provided by the CSO, revisions are made mainly on a quarterly basis. The monthly estimates are subject to significant historical revisions each quarter when the official quarterly b.o.p. data are published. They are also revised annually when revisions are made to the four quarters making up the calendar year.

The CSO makes users, including the ECB, aware of the reasons for significant revisions to earlier data. When major methodological changes are contemplated, the CSO tends to make users aware of their introduction in advance and describes the methodology involved in the relevant national publications and in communications with the international organisations concerned.

The ECB’s revision policy is being implemented as far as possible.

3.9 PUBLICATION

Official b.o.p. data are collected and published by the CSO on a quarterly basis, with a current time-lag of three months. External debt data are also published on a quarterly basis with a three-month timeliness. An annual i.i.p. series (showing data from end-December 1998 to 2001) was introduced in December 2002. These results are available with a timeliness of nine months. In addition, the CSO has also introduced annual releases giving greater geographical detail on foreign direct investment and on Irish resident holdings of portfolio investment securities issued by non-residents. The b.o.p., i.i.p. and related data are published in hard copy and are also available in the CSO databank and on the internet. Users are made aware of the expected (“no later than”) date of publication four months beforehand in the CSO’s monthly advance publication calendar, which covers a four-month period (under the IMF Bulletin Board arrangements). Regular users are notified each Thursday of the date of the CSO’s releases and publications due in the following week.

The CBFSAI provides its own early independent estimates and analysis of b.o.p. flows to the public as part of its quarterly review of national and financial market developments.

The titles of the publications produced by the CSO and the CBFSAI on the b.o.p. are listed in Sub-section 13.1.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

While the CSO has expanded its monthly data collection, it does not operate a full b.o.p. data collection system in Ireland at this frequency. Official b.o.p. data are collected and compiled on a quarterly basis only through surveys and administrative data. These data have a timeliness of the order of three months, compared with the six-week requirement for monthly b.o.p. estimates.

For monthly b.o.p. current account items, broad unofficial estimates, including a euro area/non-euro area geographical split, are provided by the CSO in close consultation and cooperation with
the CBFSAI. The CSO uses a range of methods to estimate monthly flows within the required time frame. For a few components (e.g. merchandise, transfers), monthly data are available. The remaining current account data are largely based on a modelling approach which relies largely on proxies and forecasts of quarterly data interpolated into monthly frequency. It also incorporates a system of indicators based on other published CSO data series. All of the estimates are provided to the ECB within six weeks of the reference month. Both current estimates and historical data are subject to substantial revision each time official quarterly b.o.p. results are published.

The CSO intends to explore how to further improve this modelling technique where possible, and also whether the data for certain items could be compiled in other ways.

As regards the financial account, much of the data required for the portfolio and other investment accounts are available from the CBFSAI and from other administrative sources. The CBFSAI provides monthly position data on the MFI sector (including money market funds), with the requisite instrument and geographical breakdown, based on money and banking returns. The CSO compiles the estimated b.o.p. transactions from this information after adjusting for the estimated impact of valuation changes. Data on the transactions of the monetary authority with non-residents, including changes in reserve assets, are compiled by the CBFSAI from internal accounting information. Data for the government sector are provided monthly to the CSO by the NTMA with full geographic and instrument breakdowns. This information relates to government foreign debt and to the investments made by the National Pensions Reserve Fund. The CBFSAI also provides data on changes in non-resident holdings of government bonds, based on monthly reports from Euroclear. Data on issues, redemptions and changes in net asset values of IFSC collective investment institutions are collected monthly, at individual level, by the CBFSAI. Administrators reporting to the CBFSAI for CIIIs under their control have now given permission for detailed monthly information to be shared with the CSO. In this context, both institutions are working closely to reconcile any differences between b.o.p./i.i.p. data collected by the CSO and regulatory data supplied to the CBFSAI. Flows through CIIIs constitute by far the largest component of portfolio investment in the Other sectors category in Ireland’s b.o.p. statement.

The monthly statement also includes some estimates of the outward portfolio investment made by institutional investors. This information is now based on data directly collected by the CSO from the larger entities involved.

The CSO now uses published information on company start-ups and closures, and on mergers and acquisitions, as a means of improving the direct investment estimates. It is also involved in the project sponsored by the ECB to examine the feasibility of using the proposed “common form” for data collection from multinational companies.

In addition, the CSO expanded its monthly data collection in 2003 to include certain large financial intermediaries not otherwise covered by monthly reporting arrangements. The coverage by these monthly collection arrangements is now kept under review in order to ensure that major players identified in the quarterly system are also included in the monthly system. Beyond this, there are currently no other plans to extend the data collection arrangements to full monthly reporting, mainly because of the burden this would place on b.o.p. respondents and because of resource constraints concerning the collection and compilation of b.o.p. statistics generally.

In line with ECB requirements, virtually all of the monthly series are subdivided into flows between countries participating in the euro area and extra-euro area flows. For MFI transactions
data in the financial account, the geographical information is based on data supplied to the CSO by the CBFSAI. The CBFSAI and CSO also work closely to estimate the geographical and instrument details for CIIs, based on the investment policies of particular funds and on detailed quarterly data collected by the CSO. The CSO obtains monthly geographical details from the NTMA on its transactions and those of the National Pensions Fund Reserve. Some geographical information is also available from financial enterprises covered by the CSO’s monthly data collection arrangements. Otherwise, the geographical split is based essentially on the corresponding split in the quarterly data supplied by the CSO to the ECB and Eurostat (except for the merchandise trade item, for which the geographical details are more directly available).

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

A summary of the estimation methods used is given in the table below. These are subject to review in the context of any changes which may be implemented in the CSO’s b.o.p. collection system generally.

4.2.1 FOR THE CURRENT ACCOUNT

4.2.1.1 FOR GOODS

The CSO publishes a monthly series relating to merchandise trade, with exports and imports recorded on an f.o.b. and c.i.f. basis respectively. For the purposes of compiling monthly b.o.p. estimates on schedule, the data are brought up to date by projecting the official monthly series forward. Account is then taken of any further material information available on specific transactions reported in the media or elsewhere. The resulting exports and imports estimates are then further adjusted to a BOP conceptual basis using factors derived from the quarterly data.

The official merchandise trade data are compiled from Intrastat and customs (i.e. extra-EU) data, the latter being compiled on a “general trade” basis. Regarding the geographical breakdown, the CSO implemented the European Commission (Eurostat) recommendations on country allocation in 2003, i.e. “country of origin” (for imports from non-EU countries), “country of consignment” (for imports from EU countries) and “country of destination” for all exports. In addition, the CSO implemented, to the extent possible, the recommendations of the BOP Working Party of the Committee on Monetary, Financial and Balance of Payments Statistics (CMFB) concerning the conversion of c.i.f. imports to an f.o.b. basis. New conversion factors for intra-EU and extra-EU imports were introduced in 2003. Apart from these conversions, the CSO’s BOP Division currently makes further adjustments to the published official foreign trade statistics for Ireland in order to align them more closely with b.o.p. concepts. These adjustments take account of the application of the “change in ownership” principle as well as valuation adjustments arising from traders’ accountancy practices. The official merchandise trade results are published both seasonally adjusted and unadjusted by the CSO. There are no immediate plans, however, to introduce seasonally adjusted b.o.p. merchandise trade data.

No specific treatment is applied to military goods; the treatment and the geographical breakdown are the same as for other merchandise.

Special Community programme transactions (Satellite, Airbus, etc.) do not appear to exist for Ireland.

4.2.1.2 FOR SERVICES

Monthly travel estimates are based on the application of trends observed in monthly inward and outward passenger movements and associated expenditures in Ireland and abroad. Monthly transport estimates are based on movements in merchandise trade, the freight adjustment from the c.i.f. to f.o.b. conversion of the valuation of imports being added. Apart from computer services, which is extrapolated on the basis of a time series approach, other
business services exports can be estimated from the monthly merchandise exports series with which they are quite well correlated. Business services imports largely relate to the activities of multinational manufacturing companies operating in Ireland and can be again linked to merchandise exports. Geographical allocation is made on the basis of the quarterly pattern observed. The remaining services items combined are estimated on the basis of their combined relative contributions observed in the earlier quarterly data.

4.2.1.3 FOR FACTOR INCOMES
Direct investment income debits are highly correlated with merchandise exports and are estimated from the projected monthly trade series. Portfolio and other investment income credits and debits are estimated by applying market yields to estimated stocks derived from opening (start of year) positions adjusted for quarterly and monthly flows. Geographical allocation is made on the basis of the quarterly pattern observed. The smaller income items (e.g. direct investment income credit) are estimated by interpolation of quarterly data.

4.2.1.4 FOR CURRENT INTERNATIONAL TRANSFERS
The CSO obtains monthly information on the principal current EU transfer receipts (credits) from the Department of Agriculture and Food and from the Department of Finance. The budget contribution to the EU is the main debit item and it is obtained directly from the Department of Finance on a monthly basis. Small residual components of the credit and debit items are estimated on the basis of recent trends in the quarterly b.o.p. data relating to these items.

4.2.2 FOR THE CAPITAL ACCOUNT
The bulk of transactions on the b.o.p. capital account consists of EU transfers. As noted above, these are collected directly from recipient bodies, mainly government departments. The data are all classified as extra-euro area transactions in line with general ECB recommendations on this matter.

4.2.3 FOR THE FINANCIAL ACCOUNT
In the b.o.p. financial account, data pertaining to the government and MFI (including money market funds) sectors and to developments in the official external reserves are available on a monthly basis from government and from (CBFSAI) banking and external reserves statistics respectively. Monthly data are also available from the CBFSAI for CIs operating within the IFSC. All these data are collected with the required intra/extra-euro area geographical split. In addition, data are collected by the CSO from a number of large financial enterprises which are not covered by other monthly arrangements. By contrast, broad estimates have to be made with respect to all other items and these are based largely on an interpolation of official quarterly b.o.p. results (including the intra/extra-euro area split).

4.2.4 FOR DIRECT AND PORTFOLIO INVESTMENT
Data concerning direct investment flows are collected by means of surveys on a quarterly basis only and monthly estimates are based on these data as well as on information compiled internally by the CSO from published sources concerning company start-ups, closures, mergers and acquisitions. In addition, some limited data are provided by the CBFSAI on direct investment inflows of the MFI sector, from money and banking data.

Estimates of portfolio investment flows for the MFI sector are derived from money and banking statistics, while monetary authority data are available directly from the CBFSAI. Data for the government sector are based on monthly returns from the NTMA (covering foreign currency-denominated external debt and the foreign investments of the National Pensions Reserve Fund) and from CBFSAI information (on euro-denominated debt liabilities). Data for CIs are based largely on data collected and compiled by the CBFSAI. In addition, portfolio investment data are collected by the CSO from a number of the larger financial enterprises. The remaining components of portfolio investment are estimated by interpolating the quarterly series.

<td>Monthly data are available from the CBFSAI in line with ECB requirements for consistent reporting of Eurosystem reserve assets.</td>
</tr>
</tbody>
</table>
4.2.5 FOR FINANCIAL DERIVATIVES
Some monthly data are obtained as part of the information collected from the monthly sources described. However, given the diversity and complexity of transactions inherent in this particular b.o.p. data category as well as the relative insignificance of derivatives transactions in the context of the overall financial account, there is no justifiable basis at present for more rigorous data collection in this area.

4.2.6 FOR OTHER INVESTMENT
Other investment flows for the MFI sector are based on money and banking balance sheet information collected by the CBFSAI. Flows are derived by the CSO on the basis of stock changes adjusted for exchange rate movements. These estimates incorporate information available to the CBFSAI for those money market funds which are categorised as MFIs. Data for the monetary authorities sector are compiled directly by the CBFSAI and supplied to the CSO. Government sector data on external borrowing and deposits are supplied monthly by the NTMA. In addition, other investment data are collected by the CSO from a number of the larger financial enterprises which are not covered by existing monthly reporting arrangements. Data in respect of other items are based on an interpolation of trends from the quarterly statistics.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
The CSO’s survey system, as well as its data collection from administrative sources (CBFSAI and NTMA), requires investment income to be reported on an accruals basis. The survey forms and the requests to official sources are designed to collect financial account position and transaction data as well as income flows on a BPM5 basis. Direct investment income, portfolio investment income and other investment income are identified, as are the necessary BPM5 breakdowns of these items. Geographical detail is requested on the basis of the debtor/creditor principle, but only going back to 1998. Sectoral detail is also available.

5.1.2 INCOME ON DIRECT INVESTMENT
Direct investment income comprises income on equity and income on debt. For statistical compilation purposes, direct investment income on equity is defined as the direct investor’s share of the combination of operating surplus and investment income earned by the direct investment enterprise. Income arising from realised or unrealised capital and exchange gains/losses is excluded, as is any profit (or loss) arising from abnormal circumstances. Data are collected by means of the CSO’s quarterly survey system to reflect this definition, i.e. the profit/loss (for b.o.p. purposes) of the direct investment enterprise is its profit/loss after tax and minority interest deductions and excluding capital and exchange gains/losses, any abnormal write-off of bad debt, revaluation gains/losses and gains/losses from extraordinary items. This income is subdivided into two elements: (i) dividends and distributed branch profits and (ii) reinvested earnings and undistributed branch profits. Dividends are recorded when due for payment, which in most cases reflects the timing of the actual payment. This also applies for remittances of branch profits.

Direct investment income on debt relates to dividends on preference shares and interest on inter-affiliate trade credit, loans, bonds and notes and money market instruments. Preference share dividends are recorded when due for payment and interest is recorded on an accruals basis, the interest unpaid/not yet received being recorded in the financial account.

Geographical detail is required on the basis of the debtor/creditor principle. In the case of an Irish-owned foreign direct investment enterprise, the country attribution is determined by the location of the entity if it is a branch, or (generally) by the country of incorporation if it
is a subsidiary or an associate company. Factor income outflows in the case of a foreign direct investment enterprise located in Ireland are attributed to the country of residence of the immediate direct investor (which, in the case of a company, is generally the country of incorporation).

5.1.3 INCOME ON PORTFOLIO INVESTMENT
Portfolio investment income for bonds and notes and money market instruments is separately requested from survey respondents (including CIIs) and administrative sources on a “time-shifted” accruals basis (i.e. from their accounts). Consultation is ongoing within the BOP and National Accounts Divisions of the CSO regarding the possibility of adopting a full accruals approach, i.e. the application of market rates to marked-to-market position valuations (essentially the so-called “creditor principle”). Changes have not been made, pending the outcome of international discussions (in particular, within the ECB and Eurostat) on the matter, and the “debtor” approach is still applied. In addition, positions and movements in outstanding interest are currently collected to facilitate the correct inclusion in the financial account of any interest unpaid or not received. Geographical allocation is required on the basis of the debtor/creditor principle, as for financial account transactions. Income credits can therefore be broken down according to the euro area/non-euro area assets/liabilities split. A sectoral breakdown is also available.

The detailed information from the CSO’s survey system allows the attribution of all the income earned by CIIs to the portfolio investors (unit holders). The offset for the undistributed income is included as appropriate in the financial account. The relevant service fees charged to the CIIs are also attributed to the investors and are recorded under services in the b.o.p.

5.1.4 INCOME ON OTHER INVESTMENT
Interest flows on loans, deposits, leases, trade credits, etc. between non-affiliated entities are requested from survey respondents and administrative sources on an accruals basis. Income on reserve assets is also included under other investment income and recorded on an accruals basis. Information on positions and movements in outstanding interest is also collected. Geographical allocation is required on the basis of the residency of the creditor/debtor. In the case of syndicated loans, however, the country allocation is based on the residency of the lead bank whenever the residencies of all participating lenders are not known. Sectoral detail is also available.

5.2 DEFINITIONS
Except for the deviation mentioned in Subsection 5.3, data are in line with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
The only known deviation concerns the application of the “debtor principle” (i.e. time-shifted accruals) in determining portfolio investment income flows, rather than the “creditor principle” (i.e. full accruals) required by the BPM5 (whereby market rates are applied to marked-to-market positions).

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
As indicated above, the CSO is awaiting the outcome of the international debate concerning the calculation of income accruals.

5.6 ESTIMATION METHODS
As the income information is collected quarterly and annually from surveys and through the use of administrative sources, full estimation is not required. However, where partial or complete
non-response occurs for individual respondents, some data need to be estimated or imputed from other respondents’ data or from the non-respondent’s earlier data, trended forward as appropriate.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

General government capital transfers are already available on a BPM5 basis and are almost totally accounted for by transfers from/to the EU institutions. These EU capital transfers are compiled from data obtained from Irish government departments and are compatible with the tables produced by Eurostat.

Data relating to the outright purchase/sale of licences, copyrights, patents, etc. are distinguished in the BOP10 (“Survey on services”) form. Generally, such transactions are relatively infrequent, but when they do occur, the payments involved can occasionally be quite substantial.

6.2 DEFINITION

The recommended split between current and capital transfers was introduced by the CSO some years ago and is based on the recommendations of the European Commission (Eurostat) BOP Working Party. Only items qualifying as current transfers are included in the current account of the b.o.p.

Debt forgiveness is thought to be insignificant. The amounts involved in the acquisition/disposal of non-produced, non-financial assets, as collected in the expanded version of the BOP10 services survey, were relatively insignificant.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

Data sources for migrants’ transfers continue to be a major problem, as only estimates based on the former exchange control data are available, and these are completely out of date.

6.5 INTENDED HARMONISATION

The European Commission (Eurostat) information provided in the national tables on EU current and capital transfers vis-à-vis the Member States is a useful means of verifying data compiled on a national basis and facilitates greater harmonisation.

Investigations to date on how to make better estimates for migrants’ transfers, which are thought to be relatively small, but nevertheless significant in terms of both inward and outward flows, have not proved successful as yet. However, the CSO hopes that further consultation with the revenue authorities will initiate a process whereby suitable b.o.p. data can be compiled from their records in the future, but the implementation of the necessary systems may take some time.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

As indicated above, direct investment data are essentially collected by means of surveys (see Sub-section 3.2). These surveys request data on direct investment positions, flows and valuation changes, along with factor income information (see Sub-section 5.1.2 for details concerning direct investment income). The information provided identifies equity investment and inter-affiliate transactions/positions with regard to loans, trade credits, bonds/notes, money market instruments and financial derivatives.

Geographical information is also collected and a sectoral breakdown is available. The surveys are conducted each quarter for the larger enterprises and annually for smaller enterprises.
Chapter 4.9
Ireland

The geographical breakdown is based on the residency of the actual issuers (i.e. the debtor/creditor principle).

In the case of transactions settled through an exchange of shares, respondents are advised to report the transactions at the time they are entered in the enterprises’ books. This may be a short period before the actual exchange of paper occurs. If there is no price agreed between the parties (i.e. one share of company A equals one share of company B), the share price of the acquired company is used to value the transaction if the shares of this company are quoted. If not, then the valuation of the transaction would be based on the net asset value of the acquired company.

The compilation system was expanded in 2004 to include the relevant transactions and positions associated with Irish resident purchases of residential and commercial property abroad. In addition, the activities of the bloodstock breeding industry in Ireland have also been included.

7.2 Definition

The CSO applies the “10% rule” to determine whether ownership of the ordinary shares or voting power in an incorporated enterprise or the equivalent in an unincorporated entity is such that a direct investment relationship exists. In line with the international requirements for fully consolidated direct investment statistics, the application of the rule covers transactions with any related entities in the corporate structure which are part of the direct investment relationship. In the case of transactions between financial intermediary affiliates (including credit institutions), direct investment is limited to those transactions associated with permanent debt and equity investment. The directional principle for recording direct investment has been adopted (but the data are collected in a way that also permits classification according to assets and liabilities if required). Reinvested earnings are recorded as part of direct investment and can be separately identified.

Inter-company transactions in financial derivatives between affiliated entities are treated as direct investment, except where such transactions are between affiliated financial intermediaries.

7.3 Deviations from Agreed Definitions

In presenting the statistics for the “other capital” element of direct investment, the CSO’s interpretation and implementation of the directional approach for recording flows and positions for this item is not in line with the BPM5 recommendation. It does, however, reflect an alternative approach described in the OECD Benchmark Definition of Foreign Direct Investment. Otherwise, for the CSO b.o.p. surveys, there are no deviations from the agreed definition of direct investment.

7.4 Gaps

There are no known gaps of any statistical significance.

7.5 Intended Harmonisation

The collection and compilation system is, in principle, compliant with the BPM5. In practice, the information for enterprises appears to be provided as required and hence no further harmonisation appears to be necessary. As regards presentation of the statistics concerning direct investment – other capital, however, consultations are under way at international level in order to further clarify the application and interpretation of the directional principle in this specific area.

7.6 Estimation Methods

As direct investment information is collected quarterly and annually by survey, full estimation is not required. However, where partial or complete non-response occurs for individual respondents, some data need to be estimated or imputed from other respondents’ data or from the non-respondent’s earlier data, trended forward as appropriate.
8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Inward and outward portfolio investment data are collected from a combination of surveys and administrative data (see Sub-section 3.2), the latter relating to (a) non-resident investment in Irish Government securities; (b) investment in foreign securities by the National Pensions Reserve Fund; and (c) investment in foreign securities (non-reserve assets) by the CBFSAI. Position, transaction and reconciliation data are collected as described above and geographical detail is provided. Inter-company transactions between affiliated entities are treated as direct investment, except where such transactions are between affiliated financial intermediaries.

The CSO’s collection/compilation system is an end-investor/aggregate security approach which does not rely on security databases. Information on the various types of long-term and short-term securities is collected from data providers to meet the requirements of the BPM5. Geographical allocation is requested on the basis of the debtor/creditor principle. Few difficulties have been reported by respondents in relation to the application of the country-of-issuer principle for assets; for liabilities, the country of creditor is available in many cases, but some difficulties are evident in relation to acquisitions on behalf of non-residents by intermediaries. In this regard, the CBFSAI assists the CSO by obtaining supplementary aggregate data periodically from resident banks on foreign investors’ acquisitions/disposals of securities issued by the Irish Government and held through nominee bank accounts. A major proportion of outward and inward portfolio investment is accounted for by IFSC enterprises such as CIIIs, special purpose investment companies (SPICs – for which only outward investment is portfolio in nature), credit institutions, insurance companies, etc. These entities’ activities are covered by the survey system. Apart from the IFSC, most of the remainder of inward portfolio investment is accounted for by non-resident uptake of government securities (the data being obtained from the NTMA and the CBFSAI) and by non-resident small shareholdings in Irish public limited companies. On the outward portfolio investment side, most of the “non-IFSC” investment is made by institutional investors which are also surveyed and are understood to account for the bulk of household foreign investment.

8.2 DEFINITION

The definition of portfolio investment used in Ireland essentially complies with the recommendations in the BPM5. Service charges, fees and commissions, where separately identifiable, are reported by respondents under the services item; otherwise they are included as part of the value of transactions. Positions and transactions are requested from respondents at market valuation on a “clean price” basis, i.e. exclusive of accrued income. As already indicated, amounts of accrued interest outstanding as well as interest movements are both identified separately in the survey forms. The clean-price values of positions and transactions are then converted into a market valuation inclusive of accrued interest.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Resident households’ internet transactions in foreign securities are not currently being captured adequately.

8.5 INTENDED HARMONISATION

As part of its b.o.p./i.i.p. statistical harmonisation, the CSO has participated in the IMF’s Co-ordinated Portfolio Investment Benchmark Survey introduced in December 1997 and undertaken annually since December 2001. To facilitate the compilation of the relevant data, all companies surveyed are
Harmonisation is required in relation to the determination of the correct country of creditor allocation for portfolio investment liabilities. Additional information is obtained periodically by the CBFSAI from intermediary financial institutions acting on behalf of non-resident investors that enables the identification of the residencies of the holders of Irish Government bonds. On the assets side, it will be difficult to obtain appropriate data sources to close the potential gaps in coverage of households’ internet transactions in securities. It is likely that data exchange involving counterparty compilers may be the only realistic means of addressing this issue.

8.6 ESTIMATION METHODS

As portfolio investment information is collected quarterly and annually by survey, full estimation is not required. However, where partial or complete non-response occurs for individual respondents, some data need to be estimated or imputed from other respondents’ data or from the non-respondent’s earlier data, trended forward as appropriate.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

As indicated in Sub-section 3.2, information on financial derivatives is collected using surveys and, in the case of government foreign assets and liabilities, administrative NTMA data. These surveys cover all sectors, but most of the derivatives activity involves the financial institutions. Separate data are sought on swaps (cross currency and interest rate), exchange-traded futures and options, over-the-counter (OTC) options and forward contracts. Owing to difficulties experienced by respondents, positions in some cases are only available on a net (asset/liability) basis. Transactions are requested on a net basis, as required by the ECB. Geographical breakdowns are available and are based, for the most part, on the country of residence of the counterpart which, in the case of exchange-traded contracts, is the country in which the exchange is located. Intercompany transactions between affiliated entities are treated as direct investment, except where such transactions are between affiliated financial intermediaries.

While an increasing number of respondents seem to be able to provide the information required, some respondents report some difficulties in doing so. These difficulties are not as marked as before and generally concern: reporting on a market value basis (nominal values frequently appear in returns); reporting asset and liability positions separately; and distinguishing variation margin payments from initial margins.

9.2 DEFINITIONS

The definition of financial derivatives used is that given in the IMF’s publication “Financial Derivatives: A Supplement to the Fifth Edition of the Balance of Payments Manual (1993)”. The valuation of positions and transactions at market value is requested. Net interest streams for interest arising from interest rate derivatives and cross-currency interest rate swaps are recorded under derivatives and not under factor income. In the case of exchange-traded contracts, respondents are requested to distinguish between initial margin payments and variation margin payments and to record the former under other investment and the latter under financial derivatives.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

None.
9.4 GAPS

With regard to flows, some respondents experience difficulty in distinguishing initial margins from variation margins, while others have difficulty reporting market values (as opposed to nominal values). The situation is improving through ongoing contact between the CSO and its respondents, but market valuation continues to present problems.

9.5 INTENDED HARMONISATION

The flow data for derivatives follow the agreed harmonisation principles.

9.6 ESTIMATION METHODS

No estimation methods are used, as the data are reported quarterly.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Other investment data are collected from a combination of surveys and administrative data (see Sub-section 3.2), the latter relating to (a) Irish Government borrowing from foreign lenders; (b) Irish Government deposits in foreign banks; and (c) foreign assets and liabilities of the CBFSAI under the TARGET arrangements as well as its currency and deposit transactions. Position, transaction and reconciliation data are collected as described above and geographical detail is provided.

Long and short-term claims and liabilities vis-à-vis non-resident affiliates are currently treated as direct investment, except where such transactions are between affiliated financial intermediaries and do not involve permanent debt. The value of financial derivatives recorded under direct investment is negligible.

The b.o.p. transactions of the MFI sector are compiled from information directly provided by these institutions to the CSO. As indicated above, MFIs operating from the IFSC supply both quarterly transaction and position data (as well as information on valuation changes) via the BOP45 Survey. Money market funds operating in the IFSC and classified as MFIs report within the BOP41 Survey (of CIIs). The information relating to these entities is included under the MFI category in the results. Up to the end of 2000, non-IFSC MFIs provided end-quarter position data to the CSO. Their transactions were estimated as the difference between the opening and closing positions, but adjusted for valuation changes using currency analyses of the positions. From the start of 2001, full reporting by non-IFSC MFIs commenced, with flow and position data being supplied directly to the CSO. IFSC MFIs account for over three-quarters of all MFI other investment assets vis-à-vis non-residents.

Transactions in trade credits are captured implicitly under other assets/liabilities in the returns. Revisions do not generally arise as “full” reporting is not required retrospectively.

10.2 DEFINITION

The CSO has adopted the BPM5 definitions, with necessary modifications made by the ECB. Repurchase agreements and bond lending transactions are recorded as required by the ECB. Financial leases are recorded under other investment and the income flows are recorded in the current account.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

10.4 GAPS

There are no known gaps of any significance.

10.5 INTENDED HARMONISATION

Insofar as is known, the results are compiled on a harmonised basis.
10.6 ESTIMATION METHODS

As the information is provided on a quarterly basis, the results are compiled from these returns. Some imputation is necessary for the few instances of late response, while quarterly estimation is necessary for those companies subjected to annual reporting because of their low activity volume.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Reserve assets are covered by the general reporting system (see Sub-section 3.2).

11.2 DEFINITION

The definition followed is that endorsed by the ECB’s Statistics Committee in December 1998, namely foreign currency claims on non-euro area residents as well as monetary gold, special drawing rights and the reserve position within the IMF.

Reserve assets are recorded at market prices. An instrument breakdown is available for b.o.p. purposes, in line with ECB requirements. While there are no financial derivatives transactions in reserve assets at present, their recording on a net basis – as recommended by the ECB – is supported by the CBFSAI.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

The agreed harmonisation principles apply.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

As indicated in Sub-section 3.2, since the beginning of 1998 the CSO has been operating an integrated b.o.p./i.i.p. survey collection system. Positions, transactions and reconciliation items are collected from financial services enterprises each quarter and from enterprises in other sectors each year. The collection system is designed to meet the detailed requirements of the ECB and the IMF and follows, to the extent possible, the recommendations of the BPM5 (as modified by the ECB in particular instances to meet its harmonisation requirements). Geographical detail is requested on the country of residency of the debtor for assets and that of the creditor for liabilities. Some difficulties are encountered by respondents in relation to identifying the country of the creditor for portfolio investment securities issued by residents of Ireland in all cases.

The CSO has participated in the IMF’s Co-ordinated Portfolio Investment Benchmark Survey since its introduction in December 1997 and supplies the results to the IMF for the “mandatory items”.

The CSO supplies the annual i.i.p. results for Ireland to the ECB within the specified nine-month deadline. The results for the years 1998 to 2001 were first published nationally in December 2002. Preparations have been made to compile quarterly i.i.p. results for the ECB in 2004.

12.2 DEFINITIONS

12.2.1 GENERAL

The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.

12.2.2 DIRECT INVESTMENT

The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.
12.2.3 PORTFOLIO INVESTMENT
The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.

12.2.4 FINANCIAL DERIVATIVES
The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.

12.2.5 OTHER INVESTMENT
The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.

12.2.6 RESERVE ASSETS
The definitions used follow the BPM5 recommendations and the ECB’s harmonisation recommendations.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
In general, there are no deviations from the agreed definitions.

12.4 GAPS
In the case of financial derivatives, it is not possible – owing to difficulties experienced by respondents – to isolate completely positions for assets and liabilities, and only net positions are available in some cases.

12.5 INTENDED HARMONISATION
In the case of financial derivatives, continuing efforts are needed, particularly at the respondent level, to provide position data on a gross basis and to report separately both initial margins (under other investment) and variation margins (under financial derivatives).

12.6 ESTIMATION METHODS
Generally, respondents can provide position information as required and in many cases more easily than flow data. Consequently, estimation techniques are only required for non-response imputation.

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Banca d’Italia and the Ufficio italiano dei cambi (UIC) are responsible for the balance of payments (b.o.p.) and international investment position (i.i.p.) statistics. The UIC, being an instrumental entity of the Banca d’Italia since 1998, collects information for the compilation of b.o.p. and i.i.p. statistics. Both institutions publish data on b.o.p. and i.i.p. statistics. The information is derived from the data on cross-border transactions collected by the UIC and sample surveys for certain services which are also collected by the UIC. Other sources include the international trade statistics collected by the Istituto nazionale di statistica (Istat).

2.2 LEGISLATIVE PROVISIONS

The Exchange Reform Law, which came into force in October 1988, reorganised Italy’s statistical system over the following two years and enabled the country to make the transition from a system in which residents were prohibited from transacting with non-residents (except for expressly authorised transactions) to one in which residents could freely carry out foreign transactions. Residents continued to be obliged to settle through the domestic banking system. The Ministerial Decree of April 1990 meant that operators no longer had to “channel” foreign transactions through resident banks, but were completely free to deal with foreign banks (e.g. to open deposit and current accounts abroad) or to export payment instruments, securities, etc. As a consequence of these laws, it became clear that a new collection system for b.o.p. data was needed. In May 1990 the old data collection system was integrated into a new system and, from then onwards, all residents were required to supply statistical documentation on foreign transactions either directly or through the domestic banking system. The directive put forward by the Interministerial Committee for Credit and Savings in October 1995 authorised the collection by the UIC of data on assets and liabilities of non-bank operators above a certain threshold.

Legislative Decree No 319/98, which modified the institutional position of the UIC, confirmed its powers to collect data for the purposes of b.o.p. compilation. The compilation of International trade data lies within the competence of Istat.

2.3 INTERNAL ORGANISATION

At the Banca d’Italia responsibility for the b.o.p. is vested in the Balance of Payments Unit of the Statistics Division of the Research Department, which also carries out analyses of b.o.p. developments. The Statistics Division is also responsible for money and banking statistics and for financial account statistics. In accordance with the Guideline on the Statistical reporting requirements of the European Central Bank in the field of balance of payments, international reserves template and international investment position statistics (ECB/2003/7) of May 2003, data are made available by the UIC to the ECB, for the production of the euro area b.o.p., and to the Banca d’Italia. The Banca d’Italia and the UIC are required to “monitor the quality and reliability” of statistical information.

At the UIC various divisions in the Statistics Department are involved in the production of the b.o.p. and i.i.p. The management team comprises a division involved in the coding system (International Securities Identification Number or ISIN) and in the security database management; two units (division/unit) dealing with non-bank and MFI data input; a division involved in non-banks’ data output and another division dealing with MFIs’ data output, the international banking system and b.o.p./i.i.p. compilation.

Seven staff members are involved in the compilation of the b.o.p. and i.i.p. at the Banca d’Italia, while 80 staff members are involved in the Ufficio italiano dei cambi.
2.4 EXTERNAL COOPERATION

Close links both at the executive and at the operational level exist between Istat, the Banca d’Italia and the UIC. Data are exchanged mutually and there is a permanent committee for coordination at the highest level between Istat and the Banca d’Italia.

2.5 USERS

B.o.p. data are used as input in the national accounts statistics produced by Istat.

Data are also supplied to the Ministry of the Economy and Finance; to private and public research institutes and universities; and to international organisations such as the ECB, the European Commission (Eurostat), the Organisation for Economic Co-operation and Development (OECD), the Bank for International Settlements (BIS) and the International Monetary Fund (IMF).

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The Italian b.o.p. collection system is, in principle, an open settlement system integrated with surveys, and organised around reporting banks and non-banks. Banks are required to report transactions performed for their own account and for the accounts of their customers (the reports are transmitted within the framework of the “Matrice valutaria” or MV). Non-banks are required to report their own cross-border transactions, directly or through the resident banks (the reports are transmitted within the framework of the “Comunicazione valutaria statistica” or CVS).

For some items, sample surveys are conducted by the UIC:

- since 1996 a survey of travellers has been in place to compile the travel service account;
- since 1998 an enterprise survey has been used to measure international transportation services;
- since 1998 a survey on portfolio investment and direct investment stocks has been carried out; some of the questions are dedicated to the collection of data on reinvested earnings.

The survey on travellers is carried out at Italy’s main border points (around 60 road and rail crossings, international airports and seaports). Fieldwork consists of two procedures carried out at the same time: counting (around 1,500,000 annual operations) and interviewing of randomly selected resident and non-resident international travellers (130,000 annual face-to-face interviews on the basis of a structured questionnaire). Counting allows the dimension of the reference population to be estimated; the objective of interviewing is the collection of detailed information on travellers’ expenditure. The survey is conducted continuously and produces monthly results. See Eurostat B-5, TG “Travel” Report, February 2000, paragraph 3.3.1.1. for further details.

The survey on international transportation services identifies the cost structure of international transportation by addressing a sample of operators and requesting information broken down by mode of transport, country of origin/destination, type of goods and type of transport device. The sample is layered. The layers are defined by the mode of transport, the head office nationality, the class of turnover, the geographical location and the type of transport operator. The survey also provides an estimate of the freight insurance costs.

The survey on portfolio and direct investment assets/liabilities involves banks and other financial institutions, insurance companies, companies listed on the Italian stock exchange and a sample of other enterprises. Financial institutions report both on their behalf and as custodians on behalf of the investors. The sample is layered. The layers are defined by
Istat supplies trade data on goods which is based on c.i.f.-f.o.b. valuation; the conversion to f.o.b. is made on the basis of the data on international transport and insurance services, as derived from the survey on international transport. Istat also provides data on repairs of goods, goods for processing, non-monetary gold and export data on goods procured in ports; import data are taken from returns submitted to the UIC.

Istat’s annual survey on the balance sheets and profit-and-loss accounts of Italian insurance companies is used for the estimate of the insurance service charge coefficients.

Data on compensation of employees are partially estimated on the basis of OECD data on international wage taxation.

Flow figures are collected directly for all b.o.p. items, with the exception of the financial flows of monetary authorities, which are derived from the change in stocks. For the non-banks, the reporting on foreign transactions and positions related to financial instruments is done on a security-by-security basis. The respondents indicate the ISIN code of the securities in the statistical reporting form entitled “Comunicazione valutaria statistica” (CVS) for the flows, and in the data entry provided by the UIC for the stock survey.

### 3.2 REPORTING AGENTS

(i) The **Monetary Financial Institution (MFI) sector**: banks, money market funds and monetary authorities report to the UIC. They are involved in standard reporting. They have to report stock data on their claims and liabilities vis-à-vis residents and non-residents by type of asset/liability, currency, maturity and debtor/creditor country. Assets in securities are reported on a security-by-security basis. Banks have also to report data on their foreign transactions and on those of their customers (flow data) with a breakdown by type of operation, currency, country and type of account used for settlement (nostro/vostro account, TARGET and so on).

(ii) The **non-banking sector**: international transactions have to be reported either directly to the UIC or through resident banks if settlement takes place in this way. Data are broken down on the CVS forms mainly by nature of operation, country and currency, and by variables used to classify operators (type of operator, type of enterprise, branch of economical activity, last financial year’s turnover, number of employees in enterprise, etc.). The system also collects gross transactions settled through clearing. The Italian law enforces anonymity, which means that it is impossible to identify the resident transactor after the data have been collected and checked.

(iii) The **official sector**: the Accounting Department of the Banca d’Italia reports on the external monetary position of the official sector on a monthly basis. The Ministry of the Economy and Finance reports public transfers.

(iv) **Customs and the Intra-Community Trade Statistical System (Intrastat)**: for goods, reports are made to Istat, which then calculates the data (on a c.i.f.-f.o.b. basis). The UIC subsequently estimates goods data on a f.o.b.-f.o.b. basis.

### 3.3 THRESHOLDS

The collection of stock data on the assets and liabilities of non-bank operators exceeding a threshold of €260,000 by the UIC was authorised by the Interministerial Committee for Credit and Savings in October 1995.
As of January 2002, an exemption threshold of €12,500 is applied to the banking source (Matrix system) and to the non-banking source (CVS system) for flow data.

### 3.4 Availability of Data

A full-fledged b.o.p. with country/currency breakdowns is available on a monthly basis.

### 3.5 Timeliness

Banks are requested to submit Matrix system data within 12 working days after the end of the reference month, whereas the CVS data are submitted within 25 days after the end of the reference month. The outcome of the survey on international transportation is available 30 working days after the end of the reference year. The results of the questionnaire on tourism are available about one month after the end of the reference month.

### 3.6 Compilation Frequency

The Italian b.o.p. is compiled on a monthly basis.

### 3.7 Data Controls

The procedure for handling and processing the raw data contained in the 1,000,000 records received each month by Matrix system and in the 4,000,000 records received by the CVS was
upgraded by the introduction of an advanced information processing system. A specific software tool called UIC-Maestro was distributed to the reporting entities. This data entry system combines simplicity with numerous checking functions (including diagnostic checks) which are designed to classify and input data and to reduce the potential for error. The most important banks also use a diagnostic software, provided by the UIC, which carries out checks similar to those provided by UIC-Maestro.

Controls are also exercised on the data in the system environment used for the collection of statistics (known as Matrix and Eleuteria). Some routine data checks are carried out on the integrity of the data, as well as some more complicated checks which take into account comparisons of flows and stocks. If inconsistencies are detected in the data, the Data Processing Division contacts the reporting agent, either by telephone or by means of a standard form on which details of the inconsistency are given and broken down by type of transaction.

3.8 REVISION POLICY

The provisional data are published about 30 working days after the end of the reference period. Revised data are published about 100 days after the end of the reference period. Further revisions to the data for each year are disseminated five months after the end of the reference year. The data on the merchandise item for each year are revised further and finally about 13 months after the end of the reference year. Italy will comply with the revision policies agreed upon at the international level.

3.9 PUBLICATION

As of the first months of 1999 the Italian b.o.p. statistics are published in a new format that is entirely in line with the standard components of the 5th edition of the IMF Balance of Payments Manual (BPM5).

Provisional flow data are provided in a UIC monthly press communiqué that is released about six weeks after the end of the reference period (coverage: goods, total services, total income, current transfers, total capital account, direct investment, portfolio investment, other investment, derivatives, reserve assets). More detailed and updated flow data become available around three months after the end of the reference month and are published in a monthly supplementary annex to the Banca d’Italia Statistical Bulletin and in the monthly UIC Statistical Bulletin.

The supplementary annex to Banca d’Italia Statistical Bulletin includes time series data, broken down according to the main items of the IMF/ECB classification for the b.o.p. The UIC Statistical Bulletin mainly reports cross-section data referring to a single month, with a detailed geographical breakdown. The coverage of the UIC Statistical Bulletin is greater than that of the press communiqué (greater detail for merchandise: general merchandise, goods for processing, repair of goods, goods procured in ports by carriers, non-monetary gold; services: all the IMF standard components; income: compensation of employees and capital income; current transfers: private sector and general government; capital account: capital transfers and acquisition/disposal of non-produced, non financial assets; financial account: resident sector and financial instrument/assets/liabilities breakdown). Six summary tables with time series of flow data are also reported in the UIC Statistical Bulletin. Detailed historical statistical series are disseminated via a CD-ROM, which is updated monthly.

Provisional semi-annual stock data on the i.i.p. are published about 130 days after the end of the reference period in a UIC monthly press communiqué (coverage: assets and liabilities for direct investment, portfolio investment, broken down further into equities and debts, other investment derivatives and assets for official reserves). Quarterly external debt data are published about 130 days after the end of the reference period in a monthly UIC press
release, with the data being presented in accordance with the IMF’s SDDS. The data are subsequently published in the UIC Statistical Bulletin (a breakdown by resident institutional sector is also available). The data are revised about six months after the first release, with the publication of the new period. They are revised further about 12 months after the first release.

Annual data (b.o.p. flows and the end-of-year i.i.p.) are published in the Banca d’Italia annual report five months after the end of the year.

The titles of the publications on b.o.p. statistics produced by the UIC and the Banca d’Italia are listed in Sub-section 13.1.

The publications are available in electronic form on the websites of Banca d’Italia (www.bancaditalia.it) and the UIC (www.uic.it).

The release dates for the UIC monthly press communiqué and for the supplementary annex to the Banca d’Italia Statistical Bulletin are published in advance for the next six months.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

Italy provides monthly b.o.p. data within the agreed deadline of 30 working days following the end of the reference month. In principle, the monthly b.o.p. data conform to the standards set out in the BPM5.

The aggregate data are available within the above-mentioned deadline. The need for estimates relates to 5% of the total amount. However, the major need for estimates relates to the breakdown, mainly in the financial account.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

Istat compiles the International Trade Statistics (ITS) by collecting customs documents for extra-EU trade statistics and referring to the Intrastat collection system for the intra-EU statistics. While the ITS are the source for the goods key item, transaction-based data are also available from foreign transaction reports – CVS forms – collected by the UIC. Using the CVS data, ITS data are adjusted by the b.o.p. compilers for the following items:

(i) imports
   - purchasing abroad of non-imported goods;
   - purchasing in Italy of non-resident goods;
   - settlement of goods temporarily imported for processing but transformed into definitive imports;
   - settlement of other temporary imports transformed into definitive imports;
   - re-importation of goods processed abroad for the account of residents;
   - goods procured in ports by carriers;

(ii) exports
   - selling in Italy of non-exported goods;
   - selling abroad of non-imported goods;
   - settlement of goods temporarily exported for processing but transformed into definitive exports;
   - settlement of other temporary exports transformed into definitive imports;
   - re-exportation of goods processed in Italy for the account of non-residents.

Intra-EU trade statistics are compiled following the country-of-consignment principle, while the country-of-origin principle applies to extra-EU data. When Intrastat statistics become available – generally within eight weeks since the end of the reference month – the provisional intra-EU trade figure is revised. A further revision is carried out as soon as definitive data for the whole reference year become available.

ITS show a detailed geographical breakdown from which it is possible to recover data referring to the transactions of the non-participating Member States.
However, Intrastat data are not available within 30 working days, as required for monthly b.o.p. data. As a result, a provisional intra-EU trade figure is estimated using a forecasting technique relying on a seasonal autoregressive model.

Goods imports enter the b.o.p. on a f.o.b. basis. Estimates for transport and freight insurance are available from a sample survey conducted by the UIC. The sample survey on international transport costs aims to estimate average unit costs of merchandise transport, providing merchandise and geographical breakdowns. Such costs are multiplied by corresponding volumes of imports and exports in order to obtain absolute transportation costs. The estimated absolute transportation costs for imports can be used to transform c.i.f. values into f.o.b. values, partly because the sample survey supplies data on insurance costs; in the case of road and rail transport (imports), it is possible to distinguish costs relating to transport within Italian territory, within third countries and within countries of origin.

Such c.i.f.-f.o.b. ratios may vary from month to month, because of changes in the International Trade Statistics geographical and mode-of-transport breakdowns, and may vary from year to year as sample average unit costs are updated. The goods item is compiled by applying the special trade principle.

Since January 1999 data have been compiled according to the standards set out in the BPM5. In addition, time series dating back to 1988 have been estimated to ensure consistency with such standards.

Transactions in military goods are reported; because of confidentiality rules, they are reported in some cases (for example, warships and tanks) without giving information about the merchandise category (a residual code is used), although the geographical breakdown is applied correctly.

For transactions carried out under the so-called “Community programmes”, movements of goods are reported and the geographical breakdown is made on the basis of the physical movements of the goods making up the programme.

4.2.2 FOR SERVICES

Data are mainly derived from the settlements system.

Transportation services are derived from the survey on international transport. Freight services are calculated in line with the c.i.f.-f.o.b. conversion: average transport unit costs × volume of imports/exports × resident/non-resident market share.

Travel services are derived from the survey on international tourism. The survey provides a detailed breakdown by the purpose of travel, according to the supplementary items indicated in the BPM5.

Insurance services: service charge coefficients for life and other insurance services are estimated only on the credit side, using information on Italian insurance companies. The estimated coefficients are also applied to the debit side. For life and other insurance business (with the exception of freight insurance), estimated service charge coefficients are applied to premiums collected through the settlements system. For freight insurance, the service charge coefficients are applied to the premiums estimated in line with the c.i.f.-f.o.b. conversion method (average insurance costs × value of exported/imported goods × R/NR insurers’ market shares – as derived from the “Survey on International Transport” and from the customs’ declarations/INTRASTAT data). For all the types of insurance services, the methodology includes the estimation of the premium supplements, and an offsetting entry is made in the current account income.

4.2.3 FOR INVESTMENT INCOME

Investment income flows are mostly compiled from settlement data. The only exception is debt securities income stemming from portfolio
investment, to which the accruals principle has been applied since January 1999. The investment income item relies mostly on the settlement data collected from the respondents and no forecast is normally performed except for estimating missing data when providing the provisional monthly b.o.p. data. The approach adopted for compiling the item is mixed, insofar as debt securities income is estimated mainly on the basis of the underlying stocks, while the other sub-components are compiled according to the actual transactions reported. Only for those sub-components, to which the accruals principle is applied, is the estimation carried out on a monthly basis.

With reference to portfolio investment income, the geographical split is performed by applying the same method as that used for splitting portfolio assets and liabilities in the financial account. When providing the first provisional monthly b.o.p. data, missing data are estimated by taking into account the output of both a time trend regression and an autoregressive model for departures from the trend. As soon as missing data become available – generally eight to ten weeks after the reference month – a revision of the monthly b.o.p. data is performed. Further revisions may occur when data for the whole reference year become available.

4.2.6 FOR FINANCIAL DERIVATIVES
An estimate for the financial derivatives key item is performed only when providing the first provisional figures for the monthly b.o.p. data. The estimation technique for missing data relies on a model combining both a time-trend regression and an autoregression for departures from the trend.

4.2.7 FOR OTHER INVESTMENT
An estimate for the other investment item is performed only when providing the first provisional figures for the monthly b.o.p. The estimation technique for missing data relies on a model combining both a time-trend regression and an autoregression for departures from trend.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
Italy collects data on investment income through the general reporting system.

Dividends are recorded as of the date they are paid. Income on bonds and notes and on money market instruments is compiled on the basis of the accruals principle by using stock statistics. No relevant difficulties have so far been encountered in applying such a methodology. Moreover, reinvested earnings related to direct investment are surveyed on an annual basis. These figures are adjusted in order to estimate monthly figures.

The reconciliation between estimates for providing the first provisional monthly b.o.p.
data and the outcome is ensured as final data replace provisional estimates once available.

The geographical allocation is performed in different ways for credits and debits. The former are broken down according to the debtor principle, the latter according to the residency of the first known counterpart. So far, the geographical breakdown of the item has not entailed any relevant difficulties.

Some under-recording is possible in the income account credits. It is thought to be mainly related to the investment income sub-item. A more extensive application of the accruals principle to the estimation of the whole sub-item is likely to reduce the bias and a testing exercise will be carried out.

5.1.2 INCOME ON DIRECT INVESTMENT
Data derived from settlements are integrated with estimates on reinvested earnings.

Current data on reinvested earnings are estimated using a statistical model based on the results of the foreign direct investment (FDI) survey. Revisions are performed once final data become available.

By way of example, in the 2003 direct investment stock survey, the respondents supplied:

– data on net operating profits; and
– dividends paid for the years 2002 and 2003.

Since the available time series is very short, the estimation procedure for recent years has been based on the assumption that a simple relation exists between the total amount of the monthly direct investment income and direct investment stock data.

Income on inter-company loans is not currently recorded, but its compilation in the future is planned. Consequently, Italy intends to set up a necessary estimation procedure.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
This information is mainly based on settlement data. Income on bonds and notes and on money market instruments is compiled on the basis of the accruals principle, by using data on the underlying stocks. Income on collective investment institutions is collected from settlement data, i.e. stock data are not employed as a basis for estimation. In future, the use of stock statistics is envisaged for checking the quality of the settlement data.

The UIC and the Banca d’Italia are not currently able to draw relevant conclusions on the impact of taxation issues on portfolio investment income.

5.1.4 INCOME ON OTHER INVESTMENT
Interest on loans between non-affiliated enterprises is compiled on the basis of settlement data.

Income on reserve assets is compiled on an accrual basis using stock data from the accounting system.

5.2 DEFINITIONS
Definitions are consistent with those outlined in the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
Income on inter-company loans is not currently recorded as direct investment income (see Sub-section 5.1.2).

5.4 GAPS
Income on trade credits as well as interest shares in leasing payments are not currently recorded. Italy intends to set up a necessary estimation procedure. After implementation, a testing exercise will be necessary before data can be made available. Its compilation is thus planned in the future.
5.5 INTENDED HARMONISATION

The extension of the accruals principle to the whole investment income account will be implemented.

5.6 ESTIMATION METHODS

Accruals on portfolio investment assets, i.e. on bonds and notes, are estimated by the UIC on the basis of stocks ascertained from surveys that have been carried out annually as from 2000. For the other items, cumulated flows are used. Additional information on, inter alia, interest rates, coupon maturities and interest calculation methods, is then taken from the security-by-security database. For index-linked bonds, the UIC estimates accrued interest on the basis of an average of current interest rates.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Sub-section 3.2).

6.2 DEFINITION

The capital account includes capital transfers and the acquisition/disposal of non-produced non-financial assets, as defined in the BPM5.

In particular, capital transfers consist of: (i) migrants’ transfers in cash or transfers resulting in a change in the foreign net position of resident banks; (ii) debt forgiveness; and (iii) all transfers of cash linked to such investment.

Any transfer in kind that determines a change of ownership of fixed assets (machinery and equipment) is considered as capital. Other transfers in kind are classified as current.

Regarding data sources, the main sources of data on private transfers (current and capital) are the reports from the banking and the non-banking sectors. For government transfers (current and capital), information is mainly derived from Istat statistics on data of the Ministry of the Economy and Finance. Pensions paid by the Italian pension scheme to non-residents and taxes paid to the Italian Government by non-residents are mainly derived from the banking and non-banking sectors’ reports. Data on debt forgiveness are recorded in the Italian b.o.p. Banks’ debt forgiveness is estimated using data of the Ministry of the Economy and Finance.

The source of data on capital transfers with EU institutions are the quarterly Istat statistics, as based on data of the Ministry of the Economy and Finance, disaggregated on a monthly basis by the UIC. In particular, capital transfers with the EU include: (i) contributions under the EAGGF (European Agriculture Guarantee and Guidance Fund) – “Guidance” section (credits); and (ii) investment contributions from the Regional Development Funds (credits).

6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

None.

6.5 INTENDED HARMONISATION

No harmonisation necessary.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

Italy collects data on inward and outward direct investment flows and stocks through the general reporting system. Information from the survey on direct investment is used for estimating reinvested earnings. A geographical breakdown is available, based on the residency of the issuers (i.e. debtor/creditor principle).
In the event that a change of ownership of a resident company from a non-resident to another non-resident direct investor is revealed by the survey, the change is recorded in the FDI stocks, but not in the corresponding b.o.p. flows.

Transactions settled through an exchange of shares are recorded at the time when the exchange takes place.

The valuation of transactions settled by an exchange of shares is based – in cases where no price is agreed between the parties involved – on book values.

Owing to significant changes in the statistical collection system, the revision of historical data requires estimation.

### 7.2 DEFINITION

Italy complies with the recommendations of the BPM5 and the harmonisation proposals made by the ECB.

All transactions between affiliates, including long-term and short-term trade credits as well as equity contributions in terms of real or financial assets and not implying any actual payment, are recorded under direct investment. Furthermore, all cross-border transactions in real estate are covered. Transactions of special purpose entities are included in direct investment.

### 7.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

### 7.4 GAPS

None.

### 7.5 INTENDED HARMONISATION

No harmonisation is necessary.

### 7.6 ESTIMATION METHODS

An estimation for reinvested earnings is made on the basis of data on profit and loss accounts derived from the survey on FDI.

### 8 PORTFOLIO INVESTMENT

#### 8.1 SPECIFIC FEATURES OF DATA COLLECTION

Italy collects data on portfolio investment flows through the general reporting system. The ISIN securities database is available. A geographical breakdown is available at any frequency. Geographical allocation is made according to the debtor principle on the assets side; for liabilities, only the residency of the first known counterpart is available. Therefore non-euro area assets data are available according to the issuer principle.

Owing to changes in the definition, the revision of historical data on portfolio investment requires estimation; stock data will not be used to provide flows. The breakdown of assets into intra and extra-euro area is possible for historical data.

#### 8.2 DEFINITION

Italy complies with the recommendations of the BPM5 and the harmonisation proposals made by the ECB.

Service charges, fees and commissions are not included in portfolio investment.

#### 8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

#### 8.4 GAPS

None.

#### 8.5 INTENDED HARMONISATION

No harmonisation is necessary.
8.6 ESTIMATION METHODS

No estimation is necessary.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Italy collects data on: (i) daily margins for derivatives; (ii) premiums earned/paid for derivatives; and (iii) net payments at the close of the derivatives operation. All these data are collected through the general reporting system. The residency of the counterpart is, on the assets side, the country of residence of the issuer or the country where the market is located; for exchange traded derivatives, the country corresponds to the country in which the clearing house is located. On the liabilities side, the residency of the counterpart is the country of settlement. Breakdowns by sector and by country are available on a monthly basis. No instrumental breakdown is available. Data on a gross basis are available. Initial margin payments are recorded under other investment. Daily margin payments are recorded as financial derivatives. For daily margins no breakdown is available between options-style and futures-style transactions.

9.2 DEFINITIONS

Italy complies with the definition of the BPM5 Supplement and the recommendations set out by the ECB.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

In the settlement system it is not possible to record derivatives transactions in the event of delivery of the underlying asset.

9.4 GAPS

(See above.)

9.5 INTENDED HARMONISATION

No harmonisation is planned.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Italy collects data on MFIs’ and other sectors’ flows through the general reporting system. For monetary authorities, flows are derived as a change in stocks. Breakdowns by sector, instrument and maturity are available on a monthly basis. Geographical allocation is based on the transactor principle. For trade credits, the time of recording is the date on which settlements are reported to the UIC, in the case of prepayments. For post-payments, a distinction is needed between short-term and medium/long-term trade credits. Since the former are only recorded by the settlement system ex post, they have to be estimated; this occurs in two stages: (i) a forecast of the total amount of goods to be exported/imported in the following 12 months; and (ii) an estimate of the post-payments share for each month and for each leg, based on the average share observed in the previous two years. The time of recording is derived from the time distribution of trade credits recorded in the previous two years. For medium/long-term trade credits, the time of recording of post-payments is, in principle, the date on which imports/exports occur, as reported to the UIC. Estimates are made to correct incomplete data.

For data before January 1999, MFIs’ flows were estimated from changes in the underlying stocks with adjustments for exchange rate valuation, and the geographical breakdown is estimated on the basis of stock data.

The data collection system for transactions settled through TARGET has changed since October 2000. One of the most important characteristics of the current system is that transactions carried out through TARGET are
identified separately, so that consistency checks between transactions, as reported by banks, and settlements, as reported in TARGET accounts, are feasible. In addition, the new data collection system gives greater attention to the geographical allocation of flows. Whenever banks settle their own or their customers’ transactions directly through TARGET they have to report information on both the counterpart and the settlement country. This procedure makes it easier to check and compare the reported geographical breakdown with that derived from the change in the TARGET positions.

10.2 DEFINITION

Italy complies with the recommendations of the BPM5 and the harmonisation proposals made by the ECB.

Foreign currency notes, coins, bond lending, repos and financial leasing are included under other investment. Bond lending and repos are considered as collateralised loans; the latter are much more significant than the former. Among repos, “genuine” repos are predominant.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

No harmonisation is necessary.

10.6 ESTIMATION METHODS

Trade credits and life insurance premia are partially estimated.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Sub-section 3.2).

11.2 DEFINITION

Italy complies with the recommendations of the BPM5 and with the national definition of reserve assets approved by the ECB.

The instrumental breakdown is available on a monthly basis; financial derivatives are recorded on a net basis. Reserve asset flows are derived from the change in end-of-month stock data. Balances denominated in foreign currencies are expressed in the currency of denomination. Therefore, reserve assets are recorded at the market price at the time of the transaction and converted into euro at the relevant monthly average foreign exchange rate.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

No harmonisation is necessary.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection system is based on monthly reporting of pure stocks for monetary authorities and for MFIs’ assets and liabilities. For other sectors, stocks are calculated by cumulating flows to a benchmark, taking into account the change in valuation owing to exchange rates and market price movements. For portfolio investment assets, the data are based on the
Portfolio Survey. The UIC currently conducts a survey of direct and portfolio stocks on a yearly basis. It collects information on stocks and on reinvested earning flows.

Owing to the collection and calculation method, the nine-month timeliness does not pose a problem; the i.i.p. is also published on a semi-annual basis.

Close cooperation and integration with the Financial Account Unit guarantees that the coverage and concept of the financial accounts and the i.i.p. are in line with regard to the external position.

12.2 DEFINITIONS

12.2.1 GENERAL
The definitions comply with the BPM5.

For direct investment, the directional principle is followed and reinvested earnings are included.

For portfolio investment, the valuation of the issuance of money market instruments is based on the discounted price.

Data for financial derivatives recorded on a gross basis are available; no valuation at market prices is available.

For monetary authorities, flows are derived from changes in stocks; the revaluation/devaluation of monetary gold and price adjustments are also available; exchange rate adjustments are calculated.

For MFIs, both stock and flow data are available; prices, foreign exchange and other adjustments are derived.

For other sectors, stocks of liabilities are derived from flows.

Valuation is carried out on the basis of the market price for listed securities and on the basis of book value in all other cases.

12.2.2 DIRECT INVESTMENT
The resident operator is asked to specify the percentage of equity capital held after the transaction. If the owned share is greater than 10%, then investment is treated as “direct”. In this case, all the transactions between direct investor and direct investment enterprise are treated as direct investment, according to the directional principle. The non-equity-linked participations are also considered as direct investment. Reinvested earnings are included.

12.2.3 PORTFOLIO INVESTMENT
This includes equity securities, debt securities and money market instruments that are not included under direct investment and reserve assets. Money market instruments are evaluated at the discounted price.

12.2.4 FINANCIAL DERIVATIVES
The item complies both with the definition agreed upon by the IMF and with the ECB recommendations. Data on a gross basis are available. No valuation at market prices is carried out.

12.2.5 OTHER INVESTMENT
This item covers all the assets/liabilities not recorded as direct investment, portfolio investment or reserve assets. The item includes trade credits, loans, and currency and deposits.

12.2.6 RESERVE ASSETS
This item complies with the national definition of reserve assets approved by the Governing Council in March 1999 and to be applied from 1999 onwards. Reserves include claims in foreign currencies on non-residents of the euro area, monetary gold, SDRs and the IMF reserve position.

End-of-month and end-year stock data on reserve assets are valued at the middle market prices prevailing at the end of the period. Gold is valued at the end-of-period market price (the fixing at 3 p.m., loco London). Conversion into euro is performed using the middle market exchange rates prevailing at the end of the period.
There are no reconciliation problems with regard to the stocks of reserves owing to revaluation practices. At present monthly flows of reserve assets are derived from changes in end-month stock data (reported stock data are calculated using a “flow-oriented” procedure). Monthly revaluation time series are available. Moreover, balances denominated in foreign currencies are expressed in the currency of denomination. As a consequence, prices and foreign exchange rate adjustments can be calculated.

The criterion used by accountants for the valuation of gold stocks is different from that applied in the Italian b.o.p. In the case of the latter, monetary gold is revalued monthly, using the market price.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

No harmonisation is needed.

12.6 ESTIMATION METHODS

No estimation is performed.

4) The Exchange Bureau and Other Transactions Section will operate in the near future under the Public Debt Management Department.
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Central Bank of Cyprus (CBC) is responsible for compiling the balance of payments (b.o.p.) statistics and the international investment position (i.i.p.) of Cyprus. The CBC was established in 1963 as an autonomous institution, in accordance with the Central Bank of Cyprus Law of 1963 and relevant articles of the Constitution of the Republic of Cyprus. Since 5 July 2002, the CBC has been governed by the Central Bank of Cyprus Law of 2002 (Law No 138(I)/2002), which ensures the independence of the CBC and compatibility with the relevant provisions both of the Treaty establishing the European Community and of the Statute of the European System of Central Banks and of the European Central Bank. At the same time, the pertinent constitutional provisions were amended so as to ensure central bank independence. The primary objective of the CBC, in accordance with its new statute, is to ensure price stability. Without prejudice to this primary objective, the CBC is required to support the general economic policy of the government. The main tasks of the CBC include, inter alia, the definition and implementation of monetary policy, the conduct of exchange rate policy, the holding and management of official international reserves, the supervision of banks, and the performance of the tasks of banker and financial agent of the government. In the past, the CBC also administered the Exchange Control Law, which – until the end of 2001 – formed the basis for the collection of b.o.p. data. The Exchange Control Law was repealed on 1 May 2004, at the end of a process of a gradual abolition of exchange restrictions.

Given the dismantling of exchange restrictions, in line with the *acquis communautaire*, the CBC introduced a new statistical reporting and compilation system to counter the loss of data and to produce b.o.p. statistics in accordance with the requirements of Eurostat, the European Central Bank (ECB) and the International Monetary Fund (IMF). The new system is a settlements-based system complemented by direct reporting, surveys and other sources.

2.2 LEGISLATIVE PROVISIONS

The legal basis for the collection and compilation of b.o.p. statistics is Section 64 of the Central Bank of Cyprus Law, 138(I)/2002 (the previous statute of the CBC essentially included the same provisions). In particular, the CBC Law empowers the CBC to require banks, designated financial institutions, government services, public corporations, as well as any other natural or legal person, to report to the CBC any data in their possession deemed necessary for the compilation of the b.o.p. and the i.i.p. of Cyprus.

The same law provides for penalties in the case of non-compliance with the obligation to provide data. The Governor of the CBC is vested with the power to impose administrative fines. Moreover, any violation of the law is an offence punishable, on conviction, with substantial fines. The CBC’s policy is to inform the banks and the public and persuade them of the necessity of reporting data for the compilation of the b.o.p. of Cyprus.

By virtue of Law 138(I)/2002, the CBC has issued a number of directives specifying the data to be reported. In December 2001 the CBC issued a directive to banks, under the aforementioned law, concerning the implementation of the new b.o.p. reporting system as from 1 January 2002. A series of meetings and discussions between the CBC and the banks as well as training sessions for bank employees preceded the issue of the directive. The CBC plans to issue an updated directive to banks in 2004.

2.3 INTERNAL ORGANISATION

B.o.p. statistics are compiled by the Balance of Payments and General Economic Statistics Section (hereinafter referred to as the B.o.p. Section) of the Statistics Department of the
CBC, which is also responsible for data collection and processing. The following staff of the B.o.p. Section is responsible for b.o.p. statistics: an assistant manager, four officers and eight administrative/clerical staff; it is supported by one analyst and one programmer from the Information Technology Department. Statistical work is also carried out by the following other divisions/departments/sections of the CBC:

The Banking Supervision and Regulation Division collects monthly balance sheet returns, profit and loss accounts and other returns for both statistical and prudential supervisory purposes from all deposit money banks, other financial institutions and international banking units.

The Monetary and Financial Statistics Section is responsible for the compilation and dissemination of money and banking statistics in accordance with the requirements of the ECB, Eurostat and the IMF.

The Accounting Services Department produces a number of reports relating to the CBC’s general ledger. These include the monthly balance sheet, the quarterly management accounts and the annual financial statements of the CBC.

The Direct Investments Section is responsible for the authorisation of direct investments in Cyprus from non-EU countries. It also monitors the activities of international business companies (offshore companies) and maintains a database with information on their ownership and activities, including financial statements and reports submitted by these companies. This section of the CBC prepares an annual report on developments in the international business sector. The database of international business companies is also used by the B.o.p. Section for the compilation of FDI data.

The Public Debt Management Department keeps detailed statistics on the composition of government external debt by currency, creditor, interest rate type and maturity profile. The Management of Reserves Section keeps detailed data on official reserves and produces various statistics for reserve management purposes. It also keeps statistics on the spot and forward exchange rates of the Cyprus pound and on the foreign currency deposits of domestic banks.

2.4 EXTERNAL COOPERATION

The CBC cooperates closely with the Statistical Service of Cyprus (CYSTAT). CYSTAT provides foreign trade statistics, and monthly data on receipts from tourism as well as the number of tourist arrivals and departures derived from frontier surveys, on a monthly basis. The frontier surveys are partly financed by the CBC.

The CBC also receives data from the Cyprus Stock Exchange (CSE), which is the national numbering agency and also acts as the central security depository and registry of shareholders for companies listed on the stock exchange.

The CBC cooperates with the government, in particular the Ministry of Finance, concerning government foreign borrowing and foreign grants, and the Department of Land and Surveys concerning investments by non-residents in real estate in Cyprus. In addition, the CBC cooperates with other financial supervisory authorities (Insurance Companies Control Service, Securities and Exchange Commission) for the collection of data from companies under their supervision.

As regards European and international cooperation, the B.o.p. Section of the CBC participates in the ESCB Working Group on B.o.p. and External Reserve Statistics and in Eurostat’s BOP Working Group. In the period prior to Cyprus’s accession to the EU, the B.o.p. Section of the CBC benefited from technical advice from Eurostat, the IMF, the Banque de France and the Banco de Portugal, as well as from seminars and consultations organised by the ECB. Furthermore, the CBC plans to become a subscriber to the IMF’s...
Special Data Dissemination Standard (SDDS) as soon as possible.

2.5 USERS

Internally, the b.o.p. statistics produced by the B.o.p. Section are used by other sections/departments of the CBC (e.g. the Monetary Policy Section, the External Debt Section and the Management of Reserves Section), as well as by the Monetary Policy Committee for policy formulation.

Externally, these statistics are used by CYSTAT in the production of national accounts and by the Ministry of Finance (particularly the Planning Bureau) for economic analysis. The CBC maintains regular contact with these users and meetings are often held to discuss specific issues.

B.o.p. statistics are also reported on a regular basis to European and international organisations, including Eurostat, the ECB and the IMF. Furthermore, b.o.p. statistics are published on the CBC’s website for easy access by other users and the general public.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

A new b.o.p. collection system has been implemented since January 2002. The new system is an open settlements-based system complemented by direct reporting, surveys and other sources. In particular, since 1 January 2002, domestic banks have reported to the CBC data on a transaction-by-transaction basis for transactions between residents and non-residents that are carried out on behalf of their customers or on their own behalf. Banks are required to record each transaction (credit or debit) and indicate the country, currency, and type of operation, as well as the institutional sector in the case of financial account transactions. Furthermore, an annual survey of portfolio investment stocks was initiated in 2002, within the framework of the IMF’s 2001 Co-ordinated Portfolio Investment Survey (CPIS).

The new system applies the methodology of the 5th edition of the IMF Balance of Payments Manual (BPM5), including the definition of residency. In particular, the one-year rule is applied in the case of natural persons and the physical presence criterion is applied to legal persons. Thus, companies in the international business sector (offshore companies) are treated as residents if they have a physical presence (office) in Cyprus, whereas – prior to 2002 – all companies in the international business sector were treated as non-residents in b.o.p. statistics.

3.2 REPORTING AGENTS

The following agents report data to the B.o.p. Section of the CBC:

(i) Monetary authority sector: the Accounting Services Department of the CBC provides the monthly balance sheet of the CBC, from which data on reserve assets and other required items are obtained, and the External Debt Section of the CBC provides data on government debt. The Banking Supervision and Regulation Division provides monthly balance sheets submitted by banks (both domestic banks and international banking units), as well as six-monthly profit and loss returns. The Exchange Operations and Settlements Section reports individual transactions between the government or the CBC and non-residents that are carried out by the Section.

(ii) Banking sector: As of 1 January 2002, domestic banks report individual transactions (both debit and credit) between residents and non-residents, which are carried out on behalf of their resident customers or on their own behalf. Aggregate reporting is possible for banks’ own transactions with non-
residents. Each transaction is described by type of operation, country and currency, and by institutional sector for financial account transactions. Concerning the type of operation, a simplified version of the harmonised code list for b.o.p. collection systems issued by Eurostat on 30 April 2001 is used. Data are transmitted to the CBC electronically at least twice a month, no later than five working days after the end of the reference month; this allows smooth and timely data processing and quality control by the CBC.

(iii) **General government sector:** The Department of Land and Surveys provides data on purchases and sales of real estate in Cyprus by non-residents, on a monthly basis. Various other government departments or agencies report transactions involving non-residents on a quarterly basis to the CBC.

(iv) **Other sectors:** The CSE reports data on purchases and sales of quoted securities by non-residents. In its capacity as central security depository and registry of shareholders for listed companies, the CSE also reports data on the investment positions (liabilities) of listed companies (i.e. equity held by non-resident shareholders). Public corporations (government-owned organisations such as the Cyprus Telecommunications Authority and the Electricity Authority of Cyprus) provide data on their international transactions. International business companies provide copies of their audited annual accounts. The CBC also collects data directly from other major companies involved in international transactions and conducts a number of surveys for selected activities. With regard to direct reporting, the CBC is currently drafting new comprehensive questionnaires and instructions to enterprises. Use of the new questionnaires by a large number of enterprises, which are to be selected from the b.o.p. business register maintained by the B.o.p. Section of the CBC, is expected to commence in 2005.

### 3.3 **Thresholds**

Until 1 May 2004, there were no exemption or simplification thresholds. In accordance with Regulation (EC) No 2560/2001, which has been applicable in Cyprus since 1 May 2004, banks are only required to report cross-border payments in euro if they exceed €12,500 (exemption threshold). However, thanks to automation, several banks have continued to report all transactions without filtering for thresholds.

### 3.4 **Availability of Data**

Since the first quarter of 2002, b.o.p. data have been compiled on the basis of BPM5 methodology, including the BPM5 residency definition and covering the required breakdowns. For the years from 1995 to 2001, annual data in line with the BPM5 presentation, but based on the old exchange control definition of residency, are available. For 2001, quarterly data in line with the BPM5 methodology, but based on the exchange control definition of residency, are also available. The CBC has recently estimated past data consistent with the BPM5 definition of residency for the years 2000 and 2001 and intends to estimate such data for the years from 1995 to 1999 as well. Monthly b.o.p. statistics are available as of the reference month January 2004.

Monthly data are compiled within six weeks of the end of the reference month. Quarterly data are compiled within three months of the end of the reference period, while annual data are being compiled within six months of the end of the reference period.

As of 2002, all the breakdowns required by Eurostat are available, while the following breakdowns are available for the period from 1995 to 2001:
### Table 1 Reporting scheme for b.o.p. and i.i.p. data collection in Cyprus

– FDI (income and financial flows): full breakdown by economic activity, type of operation and country as of 1997, in accordance with Eurostat’s B.o.p. VadeMecum tables Y5 and Y6; and

– financial account: partial breakdown by type of operation and sector.

As regards the detailed FDI data, the BPM5 definition of residency has been applied since the reference year 1997, although FDI data in the b.o.p. for the years prior to 2000 were adjusted to bring them into line with the exchange control definition of residency.

A complete i.i.p. statement is available as of the reference year 2002, while partial i.i.p. statements are available for the years from 1999 to 2001. In particular, FDI positions and portfolio investment liabilities in equity securities are missing from the i.i.p. statements for the years from 1999 to 2001; moreover, the international business sector is not included in these statements.

Data on external reserves are compiled monthly and are available one to two weeks after the end of the reference period.

3.5 DATA CONTROLS

Data submitted electronically by the banks are first subject to automatic checking on the basis of in-built criteria. Data accepted by this initial electronic screening are then subject to quality controls concerning plausibility and correctness by the staff of the Balance of Payments Section of the CBC. Problematic data are communicated back to the reporting bank for review and correction or clarification. Moreover, the Balance of Payments Section carries out cross-checks with statistics obtained from other sources (e.g. bank balance sheets, and FDI statistical declarations).

3.6 REVISION POLICY

Monthly data are normally revised at the end of the corresponding quarter, and at the end of the year. Quarterly data are revised when annual data for the corresponding year are compiled, and may be further revised when the data for the following year are compiled.

3.7 DISSEMINATION

B.o.p. data are published in the CBC’s Annual Report and Monetary Policy Report, and are also available on the internet at the following address: http://www.centralbank.gov.cy. Non-confidential breakdowns of data that have not been published are available to users upon request.

B.o.p. data are reported to Eurostat and the ECB, in GESMES/TS format, as well as to the IMF and other international organisations. Stocks of reserve assets are disseminated monthly.

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

B.o.p. data concerning goods are compiled by the CBC on the basis of the foreign trade statistics produced by CYSTAT in line with the “general trade” system. The foreign trade statistics as of 1 May 2004 are derived from the Intrastat system for intra-EU trade (previously from customs documents), and from customs documents for trade with third countries. The figures derived from customs documents record the physical movement of goods across the national frontier as declared by importers and exporters on the completed documents. Importers and exporters are usually required to present their documents before they can obtain customs clearance for the goods. Therefore, these import and export figures correspond fairly closely to goods actually imported and exported.
With regard to imports of military goods, data including a geographical breakdown are collected from the CBC’s Exchange Operations and Settlements Section, which carries out the relevant payments.

For monthly b.o.p. statistics, data from the settlements system are currently used, since CYSTAT’s foreign trade statistics are not available in time. The import figures from the settlements system have been found to correspond very closely to foreign trade figures, whereas the export figures need to be adjusted on the basis of past trends.

4.2 DEFINITION

CYSTAT records foreign trade statistics on both a “general trade” and a “special trade” basis. Imports under the “general trade” recording system comprise goods entering directly for home consumption, together with goods imported and placed in bonded warehouses. Under the “special trade” system, the import statistics are restricted to those goods cleared directly for home consumption together with those withdrawn from bonded warehouses and destined for the local market. Total exports include both domestic exports and re-exports, whether or not from bonded warehouses. Domestic exports are defined as goods which have been produced, manufactured or partly manufactured in Cyprus, excluding goods originally imported and having undergone only repair or minor operations. Re-exports are defined as goods originally imported and re-exported in the same condition in which they were imported or after undergoing repair or minor operations.

In foreign trade statistics, goods exported and imported are valued on an f.o.b. and a c.i.f. basis, respectively. In the case of imports where an amount in foreign currency is converted to its Cyprus pound equivalent, the rate of exchange used is that applicable at the time of lodgement of the customs entry. The foreign trade statistics include breakdowns by country and by commodity.

In compiling the b.o.p., the CBC makes the c.i.f./b.o.p. adjustment by applying a fixed c.i.f./f.o.b. ratio. The CBC also makes certain adjustments for coverage. In particular, the foreign trade data are supplemented with data on repairs of ships and aircraft obtained from the settlements system.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

4.4 GAPS

Goods for processing are not yet identified separately.

4.5 INTENDED HARMONISATION

The CBC and CYSTAT are working towards the separate identification of goods for processing, as well as of gold held as a store of value and other non-monetary gold. Ways of improving the c.i.f./f.o.b. adjustment are also being considered.

4.6 ESTIMATION METHODS

Normally, data on goods are available within the time frame for b.o.p. compilation, either from foreign trade statistics or from the settlements system, so that there is no need for any estimation, other than the c.i.f./f.o.b. conversion for imports.

1) Even though a geographic breakdown of the monthly data is available, monthly b.o.p. statistics are currently only disseminated at the world level, since geographical distribution is not required for countries not participating in the euro area.
2) For items marked with an asterisk (*), a geographical breakdown at Eurostat’s level 1 plus each of the EU-25 countries is available.
3) For items marked with double asterisk (**), a geographical breakdown at Eurostat’s level 1 is available.
4) Monthly foreign trade statistics are produced by the Statistical Service of Cyprus (CYSTAT) about 3 months after the reference month. More timely data on imports and exports of goods are obtained from the settlements system.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on services broken down by type of service, country and currency are obtained from the settlements system. In addition, data on certain services are obtained as follows from other sources.

(i) Transportation

This category covers freight and passenger services provided by sea and air transport operators. Freight services are adjusted in accordance with the estimates made to convert imports c.i.f. to imports f.o.b. Concerning passenger transport, data reported by banks under the settlements system are cross-checked and supplemented with data obtained from a survey of major resident passenger transport operators. Settlements data for supporting, auxiliary and other transport services are supplemented with data from the financial statements or reports of international business companies engaged in such activities.

(ii) Travel

Travel credits for tourism are obtained from CYSTAT, which conducts a monthly survey on tourist expenditure in Cyprus. Per person expenditure derived from the survey is combined with the number of
tourist arrivals, as given by the frontier survey of incoming travellers which is also conducted by CYSTAT. With regard to education-related revenue, data reported by banks under the settlements system are supplemented with data on foreign students provided by the Ministry of Education and Culture. The value of travel debits is obtained from the settlements system. Reported data include foreign exchange allowances issued to resident travellers, foreign exchange issued for education, private medical spending abroad, payments by resident travel agents and foreign exchange outflows through credit or debit cards.

(iii) Other services
Settlements data for other services are supplemented with data from the financial statements or reports of international business companies engaged in such activities.

Communications: Settlements data are checked for consistency with data obtained from a survey of the companies or organisations in this field. The survey is conducted on an annual basis, but quarterly data are obtained.

Insurance: Merchandise insurance is derived from both the settlements system and an estimate on the basis of the total c.i.f. value of imports.

Government services (not included elsewhere): entries for this category include foreign military expenditure in Cyprus, foreign embassy expenditure in Cyprus, the Cyprus Government’s foreign service expenditure abroad, and other government expenditure abroad. Data are obtained from the Government’s accounts (budget abstracts) and from the settlements system (including banks and the Exchange Operations and Settlements Section of the CBC).

5.2 DEFINITION
The definitions applied in the compilation of services are generally in line with those of the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

5.4 GAPS
Data on transactions settled via banks abroad are only partly covered, through the aforementioned surveys of some service providers (e.g. transport services) and the financial statements or reports of international business companies. Before 2002, credits for a number of services, in particular for financial and other business services, were missing.

5.5 INTENDED HARMONISATION
The CBC is planning to initiate or extend surveys and direct reporting by major service providers in order to improve the accuracy of services data and to fill the gaps arising from transactions settled via bank accounts abroad.

5.6 ESTIMATION METHODS
Both freight transport and freight insurance are partly derived from estimates on the basis of c.i.f. import data.

6 INCOME
6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS
6.1.1 COMPENSATION OF EMPLOYEES
Data are obtained from the settlements system.

6.1.2 INCOME ON DIRECT INVESTMENT
The definitions set out in the BPM5 are generally followed. The 10% rule is applied to separate FDI from portfolio investment income. Income on inter-company loans is recorded as
income on direct investment and is identified separately from other investment income.

Since 2002, data on dividends, interest on intercompany loans and rent are obtained from the settlements system. The settlements data are cross-checked and complemented with information contained in audited accounts of FDI companies.

Reinvested earnings are compiled on the basis of information contained in the audited annual accounts of FDI companies. An offsetting entry in the financial account item direct investment is recorded. Because the audited accounts of FDI companies are not available in time, reinvested earnings for the current year are estimated from information in the accounts for previous years.

Breakdowns of direct investment income are available by instrument, country and economic activity, in accordance with Eurostat’s B.o.p. VadeMecum tables Y5-3 and Y6-3.

6.1.3 INCOME ON PORTFOLIO INVESTMENT

The settlements system provides data on portfolio income of banks and their resident customers on a payments basis. In the case of bonds issued abroad by domestic banks, accrued interest may be estimated by the CBC. Interest payable on securities issued by the government (Euro commercial paper and Euro medium-term notes) is obtained from the External Debt Section of the CBC.

6.1.4 INCOME ON OTHER INVESTMENT

The settlements system provides data on other investment income (credits and debits) of banks and resident customers. For banks’ own transactions with non-residents, interest on both loans and deposits is reported on an accruals basis. Interest on reserves is obtained from the Accounting Services Department of the CBC.

6.2 DEVIATIONS FROM AGREED DEFINITIONS

Compensation of employees: the length of stay of Cypriots working abroad or of foreigners working in Cyprus is sometimes difficult to determine; hence attribution of residency on the basis of the one-year rule may sometimes lead to misclassification between compensation of employees and current transfers.

Income on direct investment: the current operating performance concept is not applied; net profits are usually used to measure earnings.

Income on portfolio investment: the accruals principle is not fully applied.

6.3 GAPS

Compensation of employees: contributions paid by employers on behalf of employees for social security, medical treatment and other benefits are not taken into account.

Income on direct investment: reinvested earnings are only partly captured, as company accounts are not available for all FDI companies (especially for outward FDI).

6.4 INTENDED HARMONISATION

Income on direct investment: the CBC plans to improve the compilation of reinvested earnings through the new direct reporting questionnaires, which are expected to be introduced in 2005.

Income on portfolio investment: the CBC intends to extend the application of the accruals principle as far as possible, using security-security data for portfolio investment.

6.5 ESTIMATION METHODS

Reinvested earnings for the current year are estimated on the basis of information available in the accounts of FDI companies for previous years.
7 CURRENT TRANSFERS

Covered by Section 8 on the capital account.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on general government transfers are collected from the Ministry of Finance and include transfers from the United Nations, the European Union, the United States, etc. Data on outward and inward transfers of other sectors, including migrants’ transfers and current transfers (workers’ remittances, cash gifts, inheritances, lottery winnings, etc.) are collected from banks under the settlements system.

8.2 DEFINITION

The new b.o.p. compilation system generally follows the definition of the capital account set out in the BPM5. Migrants’ transfers and acquisitions or disposals of land by Cyprus’ embassies abroad are recorded in the capital account. Transfers (receipts and payments) of the general government are separated into current and capital transfers, in accordance with the definitions set out in the BPM5, based on the information available.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

In some cases, there may be a misclassification of current and capital transfers due to incomplete information about the purpose of each transfer.

8.4 GAPS

Data on debt forgiveness by companies, and acquisitions or disposals of non-produced non-financial assets, other than land, are not available. Government debt forgiveness is considered negligible. Migrants’ transfers may not be fully captured by the settlements system.

8.5 INTENDED HARMONISATION

The recording of current and capital transfers to and from the EU will be enhanced with data to be provided by Eurostat, as well as by the national authorities handling EU transfers.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on FDI flows are obtained from the settlements system, from the accounts and other reports submitted by the international business companies and from the returns submitted to the Banking Supervision and Regulation Division (concerning banks’ own investments); data on inward investments in real estate (purchases and sales) are collected from the Department of Land and Surveys. Data obtained from different sources are checked for consistency. Information on the initiation of an FDI relationship is obtained from the statistical declarations submitted by resident direct investors to the domestic banks and forwarded to the CBC, the statistical declarations submitted by representatives (lawyers or accountants) of non-resident direct investors to the CBC and from authorisations granted to investors from non-EU countries.

Breakdowns by type of operation, country and economic activity (NACE classification) are recorded. In particular, Eurostat’s B.o.p. VadeMecum tables Y5 and Y6 have been produced since reference year 1997.

9.2 DEFINITION

The CBC applies the 10% OECD benchmark definition of FDI (in line with the BPM5).

Concerning the definition of residency, following the recommendation of Eurostat in the context of the FDI pilot project with candidate countries, companies in the international business sector (offshore companies) with a physical presence in Cyprus as well as international banking units...
(offshore banks) have been considered residents as from 1997, and their FDI flows have been included in the FDI questionnaires transmitted to Eurostat for the years as from 1997. However, in the b.o.p. for the period from 1997 to 1999, FDI data were adjusted to bring them into line with the older definition of residency. As from 2000, the new definition is applied for both FDI and other b.o.p. transactions (see Sub-sections 3.1 and 3.4).

9.3 DEVIATIONS FROM AGREED DEFINITIONS

Trade credits between companies with an FDI relationship are not recorded under direct investment, but are included under other investment.

9.4 GAPS

See the comments on reinvested earnings in Sub-section 6.3.

9.5 INTENDED HARMONISATION

The CBC is planning to strengthen direct reporting by selected enterprises. In this context, the CBC is currently drafting comprehensive questionnaires and instructions for resident direct investors and resident direct investment enterprises. The introduction of the new questionnaires in 2005 is expected to further improve the quality of FDI data.

9.6 ESTIMATION METHODS

See the comments on reinvested earnings in Sub-section 6.5.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Under the settlements system, banks report inward and outward portfolio investment flows. For the banks’ own portfolio transactions, domestic banks report security-by-security data, including an ISIN code, while a breakdown by securities is not required for customers’ portfolio transactions. Furthermore, data on banks’ own portfolio flows are derived from their monthly balance sheets and other returns submitted to the Banking Supervision and Regulation Division of the CBC. Data on debt securities issued abroad by the government, specifically Euro commercial paper and Euro Medium-Term Notes (EMTN), are collected from the External Debt Section of the CBC. Concerning inward investment in securities listed on the CSE, security-by-security data on non-resident purchases and sales of securities listed on the CSE are transmitted to the CBC by the CSE. Data are broken down by sector, instrument and country.

10.2 DEFINITION

The definition of portfolio investment is in line with that of the BPM5. The 10% rule is applied to distinguish direct from portfolio investment.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

As mentioned in Sub-section 6.2, the accruals principle is not yet fully applied.

10.4 GAPS

Portfolio transactions settled through bank accounts abroad are only partly captured in the b.o.p.

10.5 INTENDED HARMONISATION

The CBC is planning to collect quarterly data directly from institutional investors other than banks and from resident stockbrokers as of 2005. Resident stockbrokers may provide more complete data on households’ portfolio investment abroad.

10.6 ESTIMATION METHODS

None.
11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Since 2002 transactions in financial derivatives have been recorded as a separate category of the financial account; previously they were included under portfolio investment (debt securities). Under the settlements system, banks report transactions in financial derivatives broken down by country, currency and institutional sector. In addition, raw data collected by the CBC’s Banking Supervision Department include breakdowns by instrument, maturity, country and currency for the investments made by the banking sector.

11.2 DEFINITIONS

See Sub-section 11.1.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 11.1.

11.4 GAPS

See Sub-section 11.1.

11.5 INTENDED HARMONISATION

More accurate data on financial derivatives will be obtained through direct reporting.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

(i) Trade credits

The entries for long-term trade credits on the assets side include prepayments made in respect of imports of military equipment and in respect of imports of aircraft by Cyprus Airways. Data are obtained from the government and from Cyprus Airways. On the liabilities side, trade credits comprise estimates of suppliers’ credits calculated using a formula based on the pattern of imports. Specifically, trade credits are estimated on the basis of the assumption that one-third of the imports for domestic consumption of the last four months are unpaid.

(ii) Loans; currency and deposits

Drawings and principal repayments of government loans are compiled from data collected from the External Debt Section of the CBC and from government accounts. Data on the banking sector’s loans and deposits are obtained from the settlements system and from monthly balance sheets. Data on the other private sector’s loans are obtained from the settlements system and directly from public corporations which have substantial external borrowings. Concerning deposits maintained abroad by the non-banking private sector, limited data are obtained through the settlements system.

12.2 DEFINITION

The CBC generally follows the definitions set out in BPM5, including the accruals principle.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 9.3 concerning trade credits between entities with FDI relationships.

12.4 GAPS

Other investment flows that are not channelled through the Cypriot banking system are only partly covered by available data sources.

12.5 INTENDED HARMONISATION

Concerning trade credits, the CBC is planning to collect data from the banks’ documentary credit departments and to conduct a survey of importers and exporters. The coverage of transactions in loans and deposits not channelled through the Cypriot banking system will be addressed through comprehensive direct reporting starting in 2005.
12.6 ESTIMATION METHODS

Trade credits extended by foreign suppliers are estimated on the basis of the assumption that one-third of the imports for domestic consumption of the last four months are unpaid.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The source of data on reserve assets is the Accounting Services Department of the CBC. Stocks of reserve assets are compiled monthly and are available one to two weeks after the end of the reference month. Breakdowns by instrument and by currency are available. A geographical breakdown is prepared quarterly and communicated to the IMF on a strictly confidential basis. The transactions in reserve assets presented in the quarterly b.o.p. are derived from stocks, including adjustments for changes due to exchange rate fluctuations.

13.2 DEFINITION

The definition used for reserve assets is in line with the recommendations of the BPM5 and with International Accounting Standards. Reserve assets are under the effective control of the monetary authority. Positions of the central government are separately identified. Positions vis-à-vis residents are excluded. Gold, SDRs and the reserve position in the IMF are included in the total figure.

Reserve assets are compiled in accordance with the gross concept. Official reserves include accrued (receivable) interest, but no offsetting between assets and liabilities is undertaken. The CBC’s gold is not used as collateral for loans. Gold exchange agreements are used in reserve asset management and, in such cases, the gold remains part of the official reserves. A separate category for financial derivatives (gold swaps) is included.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations in reserve asset definitions from the BPM5.

13.4 GAPS

Breakdowns by maturity are not yet produced.

13.5 INTENDED HARMONISATION

The CBC is in a position to provide data on reserve assets in line with the IMF’s SDDS requirements on a monthly basis.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The CBC compiled a full i.i.p. statement, for the first time in December 2003, with reference to end-2002 positions. Pure stock data are generally used for the compilation of the i.i.p, with the exception of FDI positions, for which accumulation of flows was initially used.

For the years from 1999 to 2001, partial i.i.p. statements, excluding the international business sector, are available. In particular, FDI assets and liabilities, as well as portfolio investment liabilities in equity securities, were missing.

14.1.2 DIRECT INVESTMENT

A simple accumulation of flows was initially used to estimate FDI positions as at end-2002. The CBC is also recording inward FDI stocks as shown in the annual accounts of FDI companies, particularly international business companies and banks. As of 2005, actual FDI stock data, both inward and outward, will be collected through the new comprehensive questionnaire for resident direct investors and resident direct investment enterprises.
14.1.3 PORTFOLIO INVESTMENT
Stocks of portfolio investment assets are obtained from the annual portfolio investment survey, which was initiated within the framework of the IMF’s CPIS in 2002. The end-investor, security-by-security approach is followed. All resident financial enterprises are covered – namely domestic banks, international banking units, domestic and international insurance companies, financial services companies, investment companies and other collective investments schemes – and a sample of non-financial international business companies with a physical presence in Cyprus. It should be noted that, due to exchange control restrictions applicable until the end of 2003, domestic non-financial companies were generally not allowed to perform portfolio investment abroad and were thus not covered by the surveys for the years from 2001 to 2003. Portfolio investment abroad by the resident household sector was first liberalised in March 2002. In the latest survey (referring to end-2003), the portfolio investment assets of households were collected through the resident intermediaries, particularly banks and other financial services companies, as the bulk of portfolio investment of households is thought to be channelled through these intermediaries.

Portfolio investment liabilities in equity securities are compiled on the basis of data reported by the CSE for listed companies, while the main sources of data for liabilities in debt securities are the Ministry of Finance and the Debt Management Department of the CBC (for government securities), and the balance sheets of banks.

14.1.4 FINANCIAL DERIVATIVES
Stocks of financial derivatives are obtained primarily from the balance sheets of banks.

14.1.5 OTHER INVESTMENT
Complete data on other investment assets and liabilities of the banking sector are compiled from bank balance sheets. Data on deposits held abroad by the non-banking sector are obtained from the BIS figures. Detailed data on the loan liabilities of the government and public corporations are available, while the loan liabilities of other sectors are roughly estimated on the basis of historic data. Trade credit liabilities are estimated on the basis of the pattern of imports (see Sub-section 12.1), whereas trade credit assets of the private sector have not yet been compiled.

14.1.6 RESERVE ASSETS
The source of data on reserve asset positions is the accounting system of the CBC. The CBC compiles and communicates stocks of reserve assets to the ECB on a monthly basis (see Section 13). The CBC also participates in the IMF’s annual Survey of the Geographical Distribution of Securities Held as Foreign Exchange Reserves (SEFER).

14.2 DEVIATIONS FROM AGREED DEFINITIONS
The valuation of FDI positions does not yet comply with the recommended methodological standards.

14.3 GAPS
See Sub-sections 14.1.2 to 14.1.5.

14.4 INTENDED HARMONISATION
More accurate stock statistics for direct investment, as well as for financial derivatives and other investment of the non-banking private sector, will be collected through the new comprehensive questionnaires for direct reporting.

14.5 ESTIMATION METHODS
Trade credits by foreign suppliers are estimated on the basis of the assumption that one-third of the imports for domestic consumption of the last four months are unpaid.
15 CONTACTS

This country information was drafted by Cyprus in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press Division of the ECB. Enquiries specific to Cyprus should be addressed to:

Deputy Head of the Statistics Department

Banking and Monetary Statistics Division

1. Collects and compiles monetary, banking, interest rate and other financial intermediaries (OFI) statistics, including statistics for the needs of prudential supervision of credit institutions.
2. Collects, compiles and submits data for publication in the IMF monthly International Financial Statistics, the BIS monthly Economic Indicators of Eastern Europe, the ECB and Eurostat information system.
3. Ensures, in collaboration with other departments of the Bank of Latvia, the availability of the collected statistics on the Bank’s website, maintains methodological descriptions for data categories for the needs of the ECB and on the IMF’s website in accordance with SDDS requirements.
4. Carries out methodological work, and develops and reviews regulations and reporting forms with respect to monetary, banking, interest rate and OFI statistics.
5. Maintains the list of credit institutions, credit unions and OFIs for the statistical purposes.
6. Disseminates statistics on international reserves and foreign currency liquidity, using the IMF’s Dissemination Standards Bulletin Board.

Balance of Payments Statistics Division

1. Collects and compiles the balance of payments, international investment position and foreign direct investment statistics (as of Q1, 2000).
2. Ensures the dissemination of balance of payments, international investment position and foreign direct investment statistics through the Bank of Latvia’s website and printed publications. Submits data for the ECB, the Eurostat, the IMF and the BIS.
3. Maintains the methodological description for Latvia’s balance of payments data category on the IMF’s website in accordance with SDDS requirements.
4. Carries out methodological work to ensure compliance with international standards for the balance of payments compilation. Reviews and develops the description of the methodology. Develops and reviews data collection.

General Economic and Financial Statistics Division

1. Compiles the financial accounts on a quarterly basis.
2. Compiles annually general financial statistics in accordance with ECB requirements.
3. Compiles structural business statistics on credit institutions.
4. Compiles and submits general economic statistics for the ECB.
5. Performs sampling and estimation, as well as the evaluation of the quality of data for sample surveys.
6. Produces seasonally adjusted time series and forecasts.
7. Works on threshold issues and optimisation of the settlement system for cross-border payments.
8. Performs graphical analysis of data by using the SAS (Statistical Analysis System) for the needs of the management and other departments of the Bank of Latvia, as well as for different publications.
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Latvia’s balance of payments (b.o.p.) has been compiled and published every quarter since 1992. In the period from 1992 until 2000, this was done by the Central Statistical Bureau of Latvia (CSB). Starting with the data for 2000, Latvia’s b.o.p. has since been compiled and published by Latvijas Banka. Since 2001, Latvijas Banka has also been publishing the monthly b.o.p.

Latvijas Banka, Latvia’s central bank, is a public law entity established by Parliament (the Saeima, the former Supreme Council) and operates under the Law on the Bank of Latvia (adopted on 19 May 1992). Pursuant to this Law, Latvijas Banka is independent in the adoption of its decisions and their practical implementation. More detailed information on the objectives of Latvijas Banka is available on its website at www.bank.lv in the section “The Bank of Latvia”.

Under the Law on the Bank of Latvia, the most important objectives of the Bank are:

- to establish and implement monetary policy in order to ensure price stability in the country;
- to issue the national currency;
- to organise and ensure the functioning of the payment and settlement systems in Latvia;
- to collect, record and compile the financial and the b.o.p. statistics, as well as to publish the compiled statistics;
- to manage foreign assets;
- to act as financial agent for the Government;
- to issue permits (licences) to legal persons listed in the Republic of Latvia’s Register of Enterprises, except credit institutions, for the purchase and sale of foreign currency as a business activity.

2.2 LEGISLATIVE PROVISIONS

The Law on State Statistics (adopted on 6 November 1997) defines the organisational structure of state statistics in the Republic of Latvia and authorises Latvijas Banka to organise and carry out the work related to national statistics in the Republic of Latvia. In accordance with the Law on the Bank of Latvia, the Bank approves statistical reporting forms and the procedure for submitting such reports, and collects, registers and compiles financial and b.o.p. statistics, as well as publishes the compiled statistics.

The Law on Credit Institutions (adopted on 5 October 1995) stipulates that, for the purposes of macroeconomic analysis, credit institutions must submit to Latvijas Banka statistical information on payments between residents and non-residents. Pursuant to the agreement signed between Latvijas Banka and the CSB on 10 August 1999, Latvijas Banka has been responsible for the compilation of the b.o.p. since the first quarter of 2000. To ensure compliance with the requirement to report statistical information, the Republic of Latvia’s Administrative Offences Code (adopted on 7 December 1984) prescribes penalties for avoiding to provide statistical information, failing to do so in due time or reporting inaccurate data.

2.3 INTERNAL ORGANISATION

The Statistics Department of Latvijas Banka consists of three divisions: the Banking and Monetary Statistics Division, the Balance of Payments Statistics Division and the General Economic and Financial Statistics Division (see Chart 2). The b.o.p. is compiled by the Balance of Payments Statistics Division, which:

(i) collects and compiles b.o.p. and international investment position (i.i.p.) statistics (as of Q1 2000);

(ii) ensures the dissemination of b.o.p. and i.i.p. statistics through Latvijas Banka’s website and publications, and submits data to the European Central Bank (ECB), Eurostat, the International Monetary Fund (IMF) and the Bank for International Settlements (BIS);
(iii) maintains methodological descriptions of Latvia’s b.o.p. data categories on the IMF’s website in accordance with the Special Data Dissemination Standard (SDDS) requirements;

(iv) carries out the methodological work to ensure compliance with international standards for b.o.p. compilation, and reviews and develops methodology descriptions; and

(v) develops and reviews data collection techniques.

The Balance of Payments Statistics Division has a staff of 22 people, who are involved in developing data sources and estimation techniques, collecting, controlling and processing data for the monthly and quarterly statistics, and compiling and analysing the monthly and quarterly series. The staff of the Monetary Policy Department perform the data analysis.

2.4 EXTERNAL COOPERATION

For b.o.p. compilation purposes, Latvijas Banka cooperates closely with other Latvian authorities. Latvijas Banka has an agreement with the CSB on cooperation in the areas of statistics and statistical information exchange. The official foreign trade statistics compiled by the CSB have always been used in the b.o.p., while the CSB uses b.o.p. and i.i.p. data for the national accounts. The two organisations discuss methodological issues and developments in the statistical field in joint task force meetings. Close contacts are also maintained with other institutions, such as the ministries of the Republic of Latvia, the Financial and Capital Market Commission (the financial supervisory authority), the State Revenue Service and the State Social Security Agency.

Latvijas Banka also maintains contacts with other central banks in Europe, in particular those of the Baltic states.

Latvijas Banka’s b.o.p. experts regularly participate in the working groups organised by the ECB and Eurostat addressing b.o.p. statistical issues. Collaboration with the IMF aimed at improving b.o.p. statistics takes the form of consultations and cooperation related to the SDDS. Within the framework of the foreign direct investment (FDI) statistics project, Latvijas Banka cooperates with Eurostat and the Organisation for Economic Co-operation and Development (OECD).

2.5 USERS

B.o.p. and i.i.p. data are used by Latvijas Banka (its Monetary Policy and Market Operations Departments) and other institutions. The following are external users of b.o.p. and i.i.p. data: the CSB, the ministries of the Republic of Latvia, scientific research institutes (such as the Economics Institute of the Latvian Academy of Sciences and the Statistics Institute), international institutions and companies. Any person wishing to can subscribe to the b.o.p. bulletins.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

Latvia’s b.o.p. collection system is a mixed system, with surveys supplemented by the International Transaction Reporting System (ITRS) and administrative sources.

For the quarterly b.o.p. compilation, surveys are the main source of information for other sectors. There are three quarterly surveys: (i) a survey on foreign investment covering data on direct investment stocks in Latvia and abroad and related income flows broken down by country, and data on portfolio investment and other investment stocks and related income flows; (ii) a survey on transportation and intermediary services covering transportation services rendered/received by mode of transport; and (iii) a survey on services covering information on services rendered/received for b.o.p. other services items.
The survey on foreign investment uses a sampling method. Enterprises are sorted in descending order by the total amount of their cross-border settlements and are sub-divided into three size groups. All enterprises in the first (largest) size group are included in the sample. Stratified simple random sampling is applied to select enterprises from the second and third size groups. The list of enterprises for the quarterly survey on foreign investment is drawn up using the data from the State Enterprise Register, the register of enterprises maintained by the ITRS and the annual survey on foreign investment.

The list of enterprises for the survey on transportation and intermediary services is drawn up using: (i) the register of enterprises involved in foreign settlements maintained by the ITRS; (ii) the data the Road Transport Directorate provides on enterprises that receive permits for international road transportation; and (iii) the customs data on enterprises that provide ships and aircraft with fuel and other goods in ports and at the airport. The list of enterprises for the survey on services is also drawn up using the register of enterprises involved in foreign settlements maintained by the ITRS.

Data from surveys are supplemented by monthly information from the ITRS, which is the main data source for the compilation of the monthly b.o.p. other sectors items. The ITRS is an open, settlement-based system comprising indirect reporting from banks registered in Latvia and direct reporting from enterprises. The indirect reporting collects information from all banks registered in Latvia on non-bank residents’ debit and credit settlements with non-residents via domestic banks. Information received from domestic banks is reconciled with the information from non-bank residents, which report directly to Latvijas Banka on credit settlements via their accounts with domestic banks. In addition, non-bank residents also report debit and credit settlements with non-residents via their foreign bank accounts. When submitting information, the code of the external settlement in accordance with the List of External Payment Codes, as well as the country and currency codes, have to be specified. During the consolidation of data received from domestic banks and non-bank residents, the statistics on non-banks’ external payments are compiled.

Information on the monetary authorities sector and reserve assets is provided by Latvijas Banka. These data are broken down by country and currency. Information on the banking sector is derived from the banking statistics compiled by the Banking and Monetary Statistics Division (see Chart 2), which provides the residency split and the country and currency breakdowns for the main items of the balance sheet of credit institutions.

The household sector is covered by: aggregated data from the CSB on persons entering and leaving the country; data from the State Social Security Agency on the pensions received/paid in accordance with inter-governmental agreements; data from the State Revenue Service on the social tax paid by foreign embassies in Latvia for their local staff; and the monthly Latvijas Banka survey on the enterprises rendering intermediation services related to job contracts for working abroad. Data on natural persons’ debit and credit settlements with non-residents via domestic banks are included in the ITRS.

Latvijas Banka also uses the data collected by the Ministry of Foreign Affairs, the Ministry of Finance, the Financial and Capital Market Commission, etc. Foreign trade statistics and labour statistics (wages and salaries paid to non-residents) are received from the CSB. Information from newspapers is also used.

3.2 REPORTING AGENTS

Information on the monetary authorities sector is derived from Latvijas Banka’s balance sheet and profit and loss account. Information on the banking sector is derived from banking statistics (the Monthly Financial Position
<p>| Table 1 Reporting scheme for b.o.p. and i.i.p. data collection in Latvia |
|---|---|---|---|
| <strong>Target respondent population (e.g. MFIs, enterprises, etc.)</strong> | <strong>Name of reporting form</strong> | <strong>Contents of reporting form</strong> | <strong>Frequency of reporting</strong> | <strong>Timeliness (deadline for submission after the end of the reference period)</strong> |
| Credit institutions (banks and branches of foreign banks) | Report on external payments of non-banks | All external payments of non-banks if the payment exceeds LVL 1,000, broken down by type of non-bank, sector of the non-bank, purpose of payment (for outgoing payments), country and currency. | reporting periods: 1st-7th; 8th-15th; 16th-23rd; 24th-last day of month | 3 business days |
| Enterprises | Notice on incoming external payments received in a domestic bank | All incoming payments made via accounts in domestic banks if the payment exceeds LVL 1,000, broken down by currency, country and purpose of payment. | monthly | 5 business days |
| Enterprises | Notice on external payments made in foreign banks | All external payments made via accounts in foreign banks if the payment exceeds LVL 1,000, broken down by currency, country and purpose of payment. | monthly | 5 business days |
| Enterprises | Report on natural person job contracts for working abroad | Maturity of contract, salary, currency, country | monthly | 15 days |
| Enterprises | Quarterly report on foreign investment | Stocks of foreign investment in Latvia and abroad and related income broken down by country. Stocks of portfolio investment and other investment (assets and liabilities) and related income. | quarterly | 25 days |
| Enterprises | Quarterly report on transportation and intermediary services | Transportation services rendered and/or received, intermediation between another resident and non-resident, intermediation between non-residents, broken down by mode of transport. | quarterly | 25 days |
| Enterprises | Quarterly report on services | Other services (postal and courier services; telecommunication services; financial services; computer services; news agencies services; other information provision services; franchise and similar rights; other royalties and licence fees; trade-related services; operational leasing; legal services; accounting and auditing services, tax consulting; business and management consulting and public relations services; advertising, market research and public opinion polling; research and development services; architectural, engineering and other technical services; waste treatment and de-pollution services; agricultural and mining services; audiovisual and related services; education services; health services; other personal, cultural and recreational services) rendered and/or received to/from non-residents. | quarterly | 25 days |</p>

</tbody>
</table>
| Credit institutions (banks and branches of foreign banks) and credit unions | Monthly financial position report (collected for banking statistics) | For the b.o.p. and i.i.p. compilation the following items are used:  
- “The Monthly Financial Position Report” (MFPR), which contains the balances (end-of-day balances) as at the last day of the reporting month in breakdown of indicators by residency principle, as well as by the national currency, currencies of the OECD countries and other currencies.  
- Appendix I “Items in the monthly financial position report of credit institutions by currency”: The following breakdown of indicators is used: by resident, country (EMU and other EU countries, other foreign countries) and international institution. The loans, securities and deposits are shown broken down by the original term of repayment.  
- Appendix J “Trust asset” shows financial instruments acquired by a reporting credit institution when managing funds of residents and non-residents. The breakdown of indicators is by residency principle, as well as by the national currency, currencies of the OECD-countries and other currencies.  
- The Appendix F “Profit and loss statement”, which shows a reporting credit institution’s income and expenses incurred in the period from the beginning of the year until the last day of the reporting month; the indicators are in a breakdown by residency principle. | monthly | 6 business days |
3.3 THRESHOLDS

An exemption threshold of €12,500 for payments made with the EU Member States in euros and Swedish kronor (euro equivalent) is applied to ITRS data collection.

3.4 AVAILABILITY OF DATA

(i) B.o.p. data:
- monthly data are available on the 30th business day following the reporting month;
- quarterly data are available on the last business day of the quarter following the reporting quarter; and
- annual data are available on the last business day of the quarter following the last quarter of the reporting year.

(ii) I.i.p. data:
- quarterly data are available on the last business day of the quarter following the reporting quarter; and
- annual data are available on the last business day of the quarter following the last quarter of the reporting year.

(iii) Official reserve assets and reserves template data:
- monthly data are available one week after the end of the reference month for official reserve assets and 15 business days after the end of the reference month for the reserves template data. The reserves template used is the IMF Data Template on International Reserves and Foreign Currency Liquidity.

Quarterly b.o.p. and i.i.p. data are broken down by sector and instrument in line with the 5th edition of the IMF Balance of Payments Manual (BPM5). A quarterly country breakdown is available for current account and FDI data.

3.5 DATA CONTROLS

Formal data controls are carried out once data have been received from reporting agents. Individual reports are checked to verify their completeness, consistency and plausibility. Errors in individual reports are detected by computer programs and/or manual checking. This is immediately followed up with a phone conference with the reporting entity or, in the event that the problems persist, a visit to the
entity to assist it in identifying data problems. All relevant transactions are checked individually for plausibility. The quality of individual data is also checked by comparing previous and current reports.

Checks at the aggregated level are carried out for each b.o.p. component. At the first aggregation level, data are broken down for each reporting agent, as well as by the type of report. Significant fluctuations are analysed to identify the underlying reasons and may lead to the uncovering of errors at a lower level of aggregation. Press information is used to detect possible reporting gaps.

In the context of the national account statistics, b.o.p. data are subject to further plausibility checks, as the results of b.o.p. statistics should be compatible with other data on the general economic situation.

3.6 REVISION POLICY

Monthly data are subject to revision when quarterly data are published. Quarterly data may be revised, if indispensable, when the data for the following quarter are published, together with the data for the related months. Time series up to one year long may be revised in March and time series up to three years long (mainly to reflect methodological changes) in September.

3.7 DISSEMINATION

A monthly bulletin entitled “Latvia’s Balance of Payments (Key Items)” is used to publish the monthly b.o.p. A quarterly bulletin entitled “Latvia’s Balance of Payments” serves to publish quarterly and annual figures for Latvia’s b.o.p. and i.i.p. and for FDI in Latvia broken down by kind of activity and investing country. These publications are first made available on Latvijas Banka’s website (http://www.bank.lv/eng/main/statistics/lbfinfo/arres/).

Official reserve assets and reserves template data are first published on Latvijas Banka’s website (http://www.bank.lv/eng/main/statistics/lbfinfo/arres/).

B.o.p., i.i.p. and international reserves data are also disseminated via Latvijas Banka’s website (http://www.bank.lv/eng/main/statistics/lbfinfo/imf/), in accordance with the IMF’s SDDS (Latvia has been a subscriber to the special data dissemination standard since 1996).

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

The data source for general merchandise is foreign trade statistics compiled by the CSB, which include data from Intrastat for intra-EU transactions and data from customs cargo declarations for extra-EU transactions. Exports include goods for export and re-export, i.e. exports of goods previously imported for domestic consumption, and humanitarian and similar aid. Imports include goods declared for domestic consumption, goods imported from customs warehouses, and humanitarian and similar aid. Foreign trade statistics also include data on exports and imports of electricity and natural gas. In addition to foreign trade statistics, the following data sources are used: data on extra-territorial trade by shipping vessels compiled by the CSB; CSB information (valuation adjustment) on goods produced in Latvia and exported from customs warehouses (such goods are recorded at their prices upon entering customs warehouses); information on banknote production and coinage costs from Latvijas Banka’s profit and loss statement; and statistics on non-banks’ external payments (from the ITRS).

The source of data on goods for processing is the foreign trade statistics. The data for repairs on goods is derived from Intrastat and customs cargo declarations by the CSB; the quarterly survey on transportation and intermediary

</tbody>
</table>
services and the statistics on non-banks’ external payments (from the ITRS) are also used. The data source for goods procured in ports by carriers is the quarterly survey on transportation and intermediary services. The data source for exports and imports of non-monetary gold is the statistics on non-banks’ external payments (from the ITRS).

4.2 DEFINITION

The definition is in line with the BPM5. Goods cover exports and imports of general merchandise, goods for processing, repairs on goods, goods procured in ports by carriers, and non-monetary gold in a specified period of time.

Foreign trade data are compiled in accordance with the Special Trade System. This means that where goods produced abroad are imported to and exported from customs warehouses, such imports and exports are excluded from the total. Data are available on a transactions basis. Imports are available on an f.o.b. basis. A geographical breakdown is also available.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

In customs cargo declarations, exported goods are valued f.o.b., whereas imported goods have been valued on a c.i.f. basis since 2000 (up to 2000, the latter were given on both an f.o.b. and a c.i.f. basis). To ensure compliance with international standards, which require that exports and imports be presented on an f.o.b. basis in the b.o.p., data for imports of goods have been adjusted every month by the CSB since January 2000. Adjustments are made using ratios giving the average relationship between f.o.b. and c.i.f. values in 1998 and 1999. To ensure that imports of goods can be broken down by country and to obtain correct information on freight, adjustments to the data from customs cargo declarations (extra-EU transactions) are made for each mode of transport and for each country of origin of the goods, separately stating resident and non-resident carriers; for Intrastat (intra-EU transactions), data adjustments are made for each country of consignment.

Where the price of goods in a customs cargo declaration is stated in a foreign currency, it is translated into LVL, applying Latvijas Banka’s exchange rate on the day that the customs cargo declaration was filled out.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

The data sources for transportation services are the quarterly survey on transportation and intermediary services and the statistics on non-banks’ external payments (from the ITRS). Foreign trade statistics are also used to obtain, in accordance with the calculation methodology described in Sub-section 4.6, the difference between c.i.f. and f.o.b. values of imported goods. The share of transportation is set apart from the obtained figure and included under transportation in the b.o.p.

Data on travel are derived from the CSB aggregated data on persons entering and leaving the country. Travellers are polled at border control points four times a year to obtain information about non-residents’ spending in Latvia and residents’ spending abroad. The average spending of a traveller is calculated using mathematical methods and, thereafter, total spending of travellers is obtained. The number of travellers is available from the State Border Guard of the Republic of Latvia, which registers all persons entering and leaving the country.
Data on other services are derived from the quarterly survey on services and statistics on non-banks’ external payments (ITRS). In addition, a number of other sources are used: banking statistics; Latvijas Banka’s profit and loss statement; aggregated data on the revenue and expenditure of the Republic of Latvia’s embassies, representative offices and consulates, submitted by the Ministry of Foreign Affairs; and data on reinsurance premiums and claims paid, submitted by the Financial and Capital Market Commission. Data on expenditure by foreign embassies, representative offices and consulates in Latvia are derived from the State Revenue Service’s information on the value added tax repaid to foreign embassies, representative offices and consulates. Another source is the CSB foreign trade statistics.

5.2 DEFINITION

The definition is in line with the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

5.4 GAPS

None.

5.5 INTENDED HARMONISATION

None.

5.6 ESTIMATION METHODS

Debit entries for passenger transportation by air are computed from data submitted by Riga International Airport on the number of passengers, the CSB data on the monthly number of residents and non-residents crossing the state border by air, and information on the average prices of airline tickets.

For credit entries, reporting agents declare total amounts received for the international carriage of passengers in the quarterly survey on transportation and intermediary services. The data on the monthly number of residents and non-residents crossing the state border broken down by mode of transportation are used for calculating the proportion of non-residents in total border crossings. This ratio is used to determine the non-resident part of the international carriage of passengers broken down by mode of transportation.

For credit entries, estimates of expenditures by students for personal travel are made using the number of foreign students in Latvia submitted by the Ministry of Education and universities. For debit entries, information submitted by foreign embassies in Latvia on the number of Latvian students and average expenditures by country is used.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES

Data sources for compensation of employees are the monthly survey on job contracts concluded by natural persons for working abroad, labour statistics (wages and salaries paid to non-residents) and data on the revenue and expenditure of the Republic of Latvia’s embassies, representative offices and consulates reported by the Ministry of Foreign Affairs.

In addition, estimates are made using data obtained from the State Revenue Service on the social tax paid by foreign embassies in Latvia for their local staff and from foreign embassies on work permits issued to Latvian residents. Information from newspapers is also used.

6.1.2 INCOME ON DIRECT INVESTMENT

Data sources for income on direct investment are the quarterly survey on foreign investment, statistics on non-banks’ external payments (from the ITRS) and banking statistics. Data sources provide breakdowns by country and
instrument, distinguishing between income on debt and income on equity. The definitions set out for income on direct investment are in line with the BPM5.

Reinvested earnings are recorded when they are reinvested. Non-banks thus provide data on the retained profit or loss for the reporting quarter, which allows the calculation of the b.o.p. reinvested earnings item for each enterprise separately. For the banking sector, the calculation is made for each bank separately on a monthly basis using banking statistics (the retained profit or loss for the reporting month is given in the Monthly Financial Position Report) and information from the Financial and Capital Market Commission on the distribution of equity capital among shareholders. In addition, data on the distribution of the banks’ audited profit for the preceding year is used when estimating dividends. Adjustments to reinvested earnings are made upon receiving information on the audited profit and its distribution. An offsetting entry for reinvested earnings is made in the direct investment account. Dividends are recorded when payable.

Data sources provide a split between income on inter-company loans and other investment income, as well as between income on debt securities between affiliates and portfolio investment income.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
Data sources for portfolio investment income are the quarterly survey on foreign investment, statistics on non-banks’ external payments (from the ITRS), banking statistics, Latvijas Banka’s profit and loss account and data submitted by the State Treasury. The definition is in line with the BPM5 and data on portfolio investment income are broken down by instrument, also in accordance with the BPM5. Data sources provide a split between income on equity, bonds and notes, and money market instruments. Interest on debt securities is recorded on an accruals basis.

6.1.4 INCOME ON OTHER INVESTMENT
Data sources for income on other investment are the quarterly survey on foreign investment, statistics on non-banks’ external payments (from the ITRS), banking statistics and data submitted by the State Treasury. The definition of income on other investment is in line with the BPM5. Data on income on trade credits are incorporated in reports as income on other investment. Income is recorded on an accruals basis. Data on income on reserve assets are derived from Latvijas Banka’s profit and loss account and are recorded on an accruals basis.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
The all inclusive concept is used instead of the current operating performance concept to measure reinvested earnings.

6.3 GAPS
None.

6.4 INTENDED HARMONISATION
As of the first quarter of 2005, the current operating performance concept is going to be used to measure reinvested earnings.

6.5 ESTIMATION METHODS
Estimation methods are used for calculating compensation of employees (see Sub-section 6.1.1) and reinvested earnings (see Sub-section 6.1.2).

7 CURRENT TRANSFERS
The sources of data on current transfers are data on the use of funds received from foreign countries and international organisations under assistance programmes (provided by the State Treasury) and data on the amounts of funds committed under registered technical assistance projects financed by foreign countries and international organisations (provided by the Ministry of Finance). Contributions of
governmental institutions to international organisations are recorded as debit entries. Other data sources are aggregated data on international cash transfers (compiled by the CSB), information on pensions paid by foreign governments to Latvian residents and on pensions paid to non-residents (compiled by the State Social Security Agency), foreign trade statistics (compiled by the CSB) and statistics on non-banks’ external payments (from the ITRS).

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The data sources for the capital account are data on the use of funds received from foreign countries and international organisations under assistance programmes (provided by the State Treasury) and data on the amounts of funds committed under registered technical assistance projects financed by foreign countries and international organisations (provided by the Ministry of Finance). These data are supplemented with statistics on non-banks’ external payments (from the ITRS). Information on the acquisition/disposal of non-produced non-financial assets is derived from statistics on non-banks’ external payments (from the ITRS).

8.2 DEFINITION

The definition of the capital account is in line with the BPM5. The split between current and capital transfers is provided by the information suppliers according to the Eurostat and ECB recommendations. There are two separate codes for current and capital transfers in the List of External Payments Codes.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Certain capital transfers, such as migrants’ transfers (excluding workers’ remittances), investment grants in kind and debt forgiveness by companies, are not fully covered.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Data sources for direct investment are the quarterly and annual surveys on foreign investment (for sampling methods, see Sub-section 3.1), banking statistics, data from the State Enterprise Register on recently established enterprises with non-resident capital participations and statistics on non-banks’ external payments (from the ITRS). Information on inter-company loans (including short-term loans and trade credits) between affiliates is included. Data on direct investment are broken down by instrument and country. Data sources also provide a breakdown by sector.

9.2 DEFINITION

Definitions are in line with the BPM5. Direct investment data cover transactions in equity, reinvested earnings (with an offsetting entry under reinvested earnings for income on direct investment), other capital (including short and long-term loans, debt securities between affiliates and trade credits). The 10% ownership criterion is applied. The directional principle for direct participations is applied to data on other sectors. Data on transactions are derived from stock data and refer to the time of the actual operation. The geographical allocation is based on the debtor/creditor principle. Special-purpose entities are not subject to different treatment, since they are not significant in Latvia.
9.3 DEVIATIONS FROM AGREED DEFINITIONS

The all inclusive concept is used instead of the current operating performance concept to measure reinvested earnings. The fully consolidated system is not used.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

As of the first quarter of 2005, the current operating performance concept is going to be used to measure reinvested earnings. Furthermore, the flow data in addition to stock data will be introduced in the survey “Quarterly Report on Foreign Investment” in order to better reconcile the international investment position stocks with the balance of payments flows.

Latvijas Banka plans to use the fully consolidated system to record data in 2008.

9.6 ESTIMATION METHODS

Estimation methods are used for calculating reinvested earnings (see Sub-section 7.1.2). To record the data on FDI equity capital in Latvia as close as possible to the market value, the information from the Latvian stock market for listed enterprises and the equity capital approach (own funds at book value) recommended by the ECB for unlisted enterprises are used.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Data sources for portfolio investment are the quarterly and annual surveys on foreign investment, banking statistics, statistics on non-banks’ external payments (from the ITRS), the State Treasury and Latvijas Banka’s balance sheet. Data on transactions are derived from stock data (see Sub-section 10.6 on estimation methods) on an aggregated basis.

Latvijas Banka also uses data from the monthly survey on securities traded in the secondary market conducted by the Financial and Capital Market Commission, which includes aggregated transaction data and breakdowns by sector (for assets) and instrument using market values.

Data on portfolio investment are broken down by sector and instrument in accordance with the BPM5.

10.2 DEFINITION

The definitions used for portfolio investment are in line with the BPM5 (financial derivatives are excluded). Portfolio investment includes tradable securities, excluding those used in repurchase agreements. Service charges, fees and commissions are excluded and recorded as services.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

Deviations concern the valuation of liabilities where data sources mostly provide book values rather than market values.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

Latvijas Banka plans to record data as close as possible to the market value (see Sub-section 10.3) in 2005 by using the information from the Latvian stock market for listed enterprises and the equity capital approach (own funds at book value) recommended by the ECB for unlisted enterprises. Furthermore, the flow data with a full geographical breakdown in addition to stock data will be introduced in the survey “Quarterly Report on Foreign Investment” in order to better reconcile the international investment position stocks with the balance of payments flows.
10.6 Estimation Methods

For the reconciliation with portfolio stocks, exchange rate changes are excluded on the basis of the data available on foreign currencies when transactions are compiled for the monetary authorities, the general government and the banking sector.

11 Financial Derivatives

11.1 Specific Features of Data Collection

Financial derivatives cover futures, forwards, options and similar instruments, where the counterparty to the transaction is a non-resident that is not a direct investor or direct investment enterprise. Financial derivatives are excluded from portfolio investment, however, since this sector is still somewhat underdeveloped. Most transactions are executed on a local basis between residents.

The data sources for financial derivatives are Latvijas Banka’s balance sheet, the banking statistics, the monthly survey on securities traded in the secondary market conducted by the Financial and Capital Market Commission (see Sub-section 10.1) and statistics on non-banks’ external payments (from the ITRS). Transactions are recorded on a gross basis.

11.2 Definitions

All definitions are in line with the BPM5 and transactions related to income on interest rate swaps and foreign exchange forward contracts are included under this item.

11.3 Deviations from Agreed Definitions

None.

11.4 Gaps

None.

11.5 Intended Harmonisation

None.

11.6 Estimation Methods

None.

12 Other Investment

12.1 Specific Features of Data Collection

Data sources for other investment are banking statistics, the State Treasury, the quarterly and annual survey on foreign investment (including trade credits) and Latvijas Banka’s balance sheet. Transaction data are derived from stock data (see Sub-section 12.6 on estimation methods). An additional data source is the statistics on non-banks’ external payments (from the ITRS).

Data on other investment are broken down by sector, instrument and maturity in accordance with the BPM5.

12.2 Definition

Definitions are in line with the BPM5.

12.3 Deviations from Agreed Definitions

None.

12.4 Gaps

None.

12.5 Intended Harmonisation

The flow data in addition to stock data will be introduced in 2005 in the survey “Quarterly Report on Foreign Investment” in order to better reconcile the international investment position stocks with the balance of payments flows.
12.6 ESTIMATION METHODS

For the reconciliation with other investment stocks, exchange rate changes are excluded on the basis of the data available on foreign currencies when transactions are compiled for the monetary authorities, general government, the banking sector and other sectors’ long-term loans.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The data source for reserve assets is Latvijas Banka’s balance sheet submitted by its Accounting Department. Data are broken down by instrument, maturity, country and currency. Data on reserve assets are compiled on a monthly basis and are broken down by instrument. Transaction data are derived from stock data. Exchange rate and price changes are excluded on the basis of the data available on foreign currencies when transactions are compiled.

13.2 DEFINITION

The definition is in line with the BPM5 and reserve assets refer only to highly liquid, marketable and creditworthy foreign currency-denominated claims on non-residents, gold, special drawing rights and the reserve position in the IMF. Latvijas Banka controls the reserve assets and positions of the central government and/or the State Treasury are not included. Reserve assets are compiled in accordance with the gross concept. Reversible gold transactions are not excluded from loans and deposits. A separate category for financial derivatives has been introduced.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

Latvia’s i.i.p. is compiled and published quarterly in the quarter following the reference period. Data are compiled and published for: direct investment (Latvia’s direct investment abroad and direct investment in Latvia); portfolio investment assets and liabilities; financial derivative assets and liabilities; other investment assets and liabilities; and reserve assets. Data on assets and liabilities are presented separately for all items.

The data sources for the i.i.p. are the same as those for the b.o.p.

14.1.2 DIRECT INVESTMENT

The coverage and concepts of direct investment are in line with the definitions used in the financial account of the b.o.p. and the data sources are the same as those of b.o.p. data (see Sub-section 9.1). A reconciliation exercise between i.i.p. stocks and b.o.p. flows is carried out by making other adjustments.

Data on direct investment are broken down by instrument. Data on direct investment in Latvia broken down by kind of activity and investing country are disseminated quarterly one quarter after the end of the reference quarter.

14.1.3 PORTFOLIO INVESTMENT

The coverage and concepts of portfolio investment are in line with the definitions used in the financial account of the b.o.p. and the data sources are the same as those of b.o.p. data (see...
Sub-section 10.1). Data refers to book values for liabilities, with the exception of data on securities traded in the secondary market. A reconciliation exercise between i.i.p. stocks and b.o.p. flows is carried out on the basis of exchange rate changes and other adjustments.

Data on portfolio investment are broken down by instrument and sector.

**14.1.4 FINANCIAL DERIVATIVES**

The coverage and concepts with regard to financial derivatives are in line with the definitions used in the financial account of the b.o.p. and the data sources are the same as those for the b.o.p. data (see Sub-section 11.1). Financial derivative stocks of other sectors are accumulated flows.

**14.1.5 OTHER INVESTMENT**

The coverage and concepts with regard to other investment are in line with the definitions used in the financial account of the b.o.p. and the data sources are the same as those for the b.o.p. data (see Sub-section 12.1). Stock data are broken down by instrument, sector and maturity. A reconciliation exercise between i.i.p. stocks and b.o.p. flows is carried out on the basis of exchange rate changes and other adjustments.

**14.1.6 RESERVE ASSETS**

The coverage and concepts with regard to reserve assets are in line with the definitions used in the BPM5 and with the financial account of the b.o.p. Data on reserve assets are compiled on a monthly basis in accordance with the gross concept and the data sources are the same as those for the b.o.p. data (see Sub-section 13.1).

Gold and debt securities denominated in convertible foreign currencies are valued at the prevailing market prices. Gold is marked to market on a daily basis. Debt securities denominated in convertible foreign currencies are revalued on a daily basis.

Data on reserve assets are broken down by instrument and sector in accordance with the BPM5. Data sources also provide breakdowns by currency and country. A reconciliation exercise between i.i.p. stocks and b.o.p. flows is carried out on the basis of exchange rate changes and price changes.

**14.2 DEVIATIONS FROM AGREED DEFINITIONS**

See Sub-sections 9.3 and 10.3.

**14.3 GAPS**

None.

**14.4 INTENDED HARMONISATION**

See Sub-sections 9.5, 10.5 and 12.5.

**14.5 ESTIMATION METHODS**

See Sub-sections 9.6.

**15 CONTACTS**

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Since the beginning of 1995, Lietuvos bankas has prepared the national balance of payments (b.o.p.) statistics, has coordinated all work related to the collection of the information necessary for the compilation of these statistics and has systematically monitored this work. The b.o.p. is compiled according to the basic methodological requirements and standards of presentation and publication of the International Monetary Fund (IMF), European Central Bank (ECB) and Eurostat. Lithuania’s b.o.p. is compiled monthly, quarterly and annually.

2.2 LEGISLATIVE PROVISIONS

The legal responsibility is set out in Article 8 of the Law No ix-1998 on Lietuvos bankas, as amended on 5 February 2004, which lists the functions of Lietuvos bankas. Specifically, Article 8.1, paragraph 9, states that Lietuvos bankas shall “collect […] balance of payments statistics […], implement standards on the collection, reporting and disseminating of the said statistics and compile the balance of payments of the Republic of Lithuania.” Furthermore, Article 54 on the “Provision of information to Lietuvos bankas” states that bodies of state authority and administration, enterprises, institutions and organisations of the Republic of Lithuania must present to Lietuvos bankas all information required for the performance of its functions.

The Republic of Lithuania’s Law No viii-1511 of 23 December 1999 on the amendment of the Law on Statistics, in particular the chapter entitled “Management of statistics” (Article 6, which deals with the agencies managing official statistics), stipulates that official statistics in the Republic of Lithuania are to be managed by the following agencies:

- government ministries;
- other state and local self-government institutions;
- agencies; and
- Lietuvos bankas, if this is provided for in the work programme for official statistics.

The other legislative provisions that are relevant for the compilation of the Lithuanian b.o.p. and i.i.p. statistics are as follows:

(i) Resolution No 106 of 23 October 2003 of the Board of Lietuvos bankas on the approval of the procedure for submitting to Lietuvos bankas the reporting statistical data necessary to compile the b.o.p. and i.i.p. This resolution states the kind of statistical data to be provided by the various ministries, public institutions and economic units and the required frequency and timeliness. This resolution also states that b.o.p. and i.i.p. data have to be provided to the ECB, Eurostat and the IMF according to the required timetable, which is published on Lietuvos bankas’ website and in its relevant publications.

(ii) Resolution No 125 of 11 December 2003 of the Board of Lietuvos bankas on the approval of the statistical statements used for the compilation of the b.o.p. and i.i.p. Lietuvos bankas collects these statements directly from commercial banks and other entities.

(iii) Law on the National Debt of 22 August 1996, which stipulates that “national debt means the total amount of domestic and foreign debt of the Republic of Lithuania; national currency means Lithuanian litas (LTL), the standard monetary unit of the Republic of Lithuania; foreign currency means the currency of any foreign state or the currency used by two or more foreign states, including the euro and special drawing rights (SDRs)”.

(iv) Resolution No 1200/8 of the Government of the Republic of Lithuania and the Board of the Bank of Lithuania on foreign loans obtained in the name of the state and taken with Government guarantee.
(v) Procedure No 1200/8 of 30 October 1997 for granting, distributing and repaying foreign loans obtained in the name of the state and taken with guarantee of the Government.

(vi) Procedure No 101 of 14 June 2001 for the registration with Lietuvos bankas of foreign loans received without a guarantee of the Government by legal persons or enterprises without the status of a legal person in the Republic of Lithuania and of loans granted to foreign economic entities (according to this Procedure, “economic entities must register with Lietuvos bankas foreign loans received without the guarantee of the Government by the Republic of Lithuania or loans granted to foreign economic entities within ten business days from the day of receiving (granting) the loan or other debt instrument”).

(vii) Resolution No 537 of 2 June 1997 of the Government of the Republic of Lithuania on the application of the Special Data Dissemination Standard (SDDS) of the International Monetary Fund in Lithuania. According to this Resolution, Lietuvos bankas is appointed as coordinator of the application of the IMF’s SDDS in Lithuania and is also responsible for the application of this Standard to the data categories of the banking sector’s analytical accounts (monetary survey), the balance of payments and the international investment position.

The 2004 Law on Lietuvos bankas governs the compilation of data on international reserves. The Law is available on Lietuvos bankas’ website (http://www.lbank.lt) in Lithuanian.

2.3 INTERNAL ORGANISATION

The compilation of the b.o.p. is the responsibility of the Balance of Payments and External Reserves Statistics Division of the Monetary Policy Department. A small team of nine people is currently involved in this compilation, dealing with all activities relating to the b.o.p. process, from the methodology, the revision of questionnaires to analysis and the drafting of reports.

2.4 EXTERNAL COOPERATION

Please see Sub-section 3.2.

2.5 USERS

Data on the b.o.p. are presented to the Government of the Republic of Lithuania, in particular to the Ministry of Finance, the Ministry of the Economy and the Department of Statistics of the Government of the Republic of Lithuania (Statistics Lithuania), as well as to the Committees of the Seimas (Parliament) of the Republic of Lithuania. The data are also submitted to international organisations such as the IMF, the World Bank, the Bank for International Settlements (BIS), the Organisation for Economic Co-operation and Development (OECD), the Statistical Office of the European Union (Eurostat) and the European Central Bank (ECB).

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

B.o.p. statistics are compiled on a monthly and quarterly basis using a survey method from various data reporters.

All quarterly reports by reporting agents include:

- a record of all credit and debit transactions;
- flow and stock data;
- other changes in the value of stocks’ total: of which changes in the prices of the financial assets and liabilities; changes in the exchange rates vis-à-vis other currencies; reclassifications and other changes; and
- a country breakdown.
As from January 2004, new monthly and quarterly surveys have been introduced. The new surveys were designed according to required breakdowns of the ECB’s latest guideline (ECB/2003/7) on the statistical reporting requirements in the field of b.o.p and i.i.p. statistics and the international reserves template. These surveys will enable the collection and compilation of b.o.p. and i.i.p. data with the required geographical allocation (i.e. following “step 2” and “step 3” approaches).

Much the same as the quarterly b.o.p., the monthly b.o.p. is compiled on the basis of statistical surveys. However, the number of respondents submitting monthly statistical statements is significantly smaller than in the case of the quarterly surveys. The number of indicators included therein is also noticeably smaller. All public institutions and commercial banks furnish Lietuvos bankas not only with quarterly reporting data, but also with their monthly figures. Monthly reporting data from other sectors are collected by way of a sampling survey of economic entities. These economic entities are selected according either to their level of representation in a specific activity or to their scope of operations with non-residents. Of a total of almost 5,000 other sector economic entities that present quarterly reporting figures, 240-260 entities submit monthly reports (statement B-09-04). The monthly data obtained from the sampling survey of economic entities are grossed up through the application of corresponding coefficients.

As individual monthly b.o.p. indicators are calculated with the aid of extrapolation coefficients and by making appropriate evaluations, aggregated data of a three-month period may not coincide with the figures of the corresponding quarter. After the compilation of a quarterly b.o.p., data for the individual months of that quarter are revised.

The monthly b.o.p. data are made public 30 business days after the end of each reporting month. For further details, please see the sub-sections on the individual b.o.p. items.

3.2 REPORTING AGENTS

B.o.p. compilation by the Lietuvos bankas is based on the statistical data collected from the following data sources and reporting agents:

(i) Statistics Lithuania supplies the main sets of data, namely data on foreign trade (on the basis of customs declarations and, since 1 May 2004, of surveys used in the Intrastat system), on transactions of non-bank entities with non-residents (services, income, financial transactions, portfolio investment and loans, all of which are recorded on the same questionnaire (F-06) by nearly 5,000 respondents) and on flows and stocks of foreign direct investment (on the basis of specific forms (TU-I1) submitted by 2,000 respondents). The data on commercial financial relations include transactions by national economic entities of all ownership forms (excluding the banking sector) with non-residents, direct foreign investment in Lithuania and direct investment by economic entities in foreign countries, as well as foreign humanitarian aid;

(ii) commercial banks submit statements (the quarterly B-09-01 and the monthly B-09-02) on their own cross-border transactions as well as a statement (B-09-03) on international payments (only the total of incoming and outgoing international payments, with an identification of the customers, on a monthly basis) directly to Lietuvos bankas;

(iii) the Ministry of Finance submits data (stocks and flows) on debt securities issued by general government, on foreign loans on behalf of the state and guaranteed by the Government, on the use of loans and their servicing costs (monthly

statement B-09-08), on the inflows received from non-residents for privatised entities in the Republic of Lithuania (monthly statement B-09-05), on technical and financial assistance (PHARE, SAPPARD and ISPA) provided by the EU (monthly statement B-09-06), on Lithuania’s payments to the EU budget (monthly statement B-09-07), on membership fees paid to international financial organisations and on consulates’ budgetary income data for the reserves template;

(iv) the Ministry of Foreign Affairs provides data on the expenditure of embassies and representative offices of the Republic of Lithuania, on the contributions of the country to international non-financial organisations (entry and membership fees), on technical assistance by foreign countries and international organisations and on the value added tax returned to foreign embassies and representative offices in Lithuania;

(v) the State Border Guard of the Ministry of the Interior submits data on the number of people arriving in/leaving Lithuania, broken down by nationality and mode of transport;

(vi) the State Social Insurance Fund submits data on pension funds received from and transferred abroad and on social insurance payments made by foreign diplomatic services residing in Lithuania for their local employees;

(vii) the Central Securities Depository of Lithuania submits data on the distribution of securities (including government securities) in the accounts of intermediaries for ascertaining the public distribution of securities between residents and non-residents (total, by country and by investor group); the Securities Commission provides data on opening and closing positions by type of security and on trading in equities; data from the Register of Corporate Debt Securities is also used;

(viii) state tax authorities provide data on the repayment of value added tax to foreign embassies and on salaries paid to non-residents;

(ix) local and regional authorities provide data on inflows received from non-residents for municipal real estate sold or leased out to them; and

(x) Lietuvos bankas provides data on the official international reserves and on its balance sheet.

3.3 THRESHOLDS

In the case of the b.o.p., no thresholds are used.

3.4 AVAILABILITY OF DATA

The b.o.p. is currently compiled monthly and quarterly by Lietuvos bankas, with input from Statistics Lithuania for the corporate sector and from public and international entities. Lietuvos bankas is responsible, in particular, for collecting data from the banking sector, state institutions and corporate sector (for the monthly b.o.p.). The monthly b.o.p. data are made public 30 business days after the end of a reporting month. Lithuania’s b.o.p. is made available 12 weeks after the end of the reference quarter.

Data on the reserve assets are compiled monthly both for official foreign reserves and for the reserves template data. Data on the reserve assets are available within one week after the end of the reference month for official foreign reserves and within one month after the end of the reference month for the reserves template data.

Lithuania’s i.i.p. is compiled on a quarterly basis and is available 12 weeks after the end of the reference quarter.

1) As from 2004, Lithuania will start to compile monthly b.o.p. data with a geographical breakdown by country (all countries; euro area/ non-euro area split) and all required items within 30 working days after the end of the reference period.
Data are collected and classified according to the international standards recommended by the 5th edition of the IMF Balance of Payments Manual (BPM5), the classification of Eurostat’s Balance of Payments Vademecum of 2003 and the ECB Guideline (ECB/2003/7) on the statistical reporting requirements of the European Central Bank in the field of balance of payments and international investment position statistics, and the international reserves template. Data are broken down by economic sector, activity and country.

### 3.5 DATA CONTROLS

Lietuvos bankas carries out checks of individual reports and of the quality of time series. It also cross-checks with other statistical sources.

### 3.6 REVISION POLICY

All quarterly data are revised when the annual b.o.p. and i.i.p. are compiled. Monthly b.o.p. data are revised after the compilation of the quarterly b.o.p.

### 3.7 DISSEMINATION

The comprehensive data (b.o.p. and i.i.p.) are published, along with short comments, in a special quarterly b.o.p. bulletin entitled “Balance of Payments of the Republic of Lithuania” and in Lietuvos bankas’ “Quarterly Bulletin”. The data are also published on Lietuvos bankas’ website (http://www.lbank.lt/Eng/publications/Index.htm) and in the IMF’s electronic bulletin, as well as on the National Summary Data Page which has a hyperlink to the home page of the IMF’s Data Standards Bulletin Board (DSBB).

For the i.i.p., an advance release calendar that meets the SDDS requirements, giving precise release dates for at least one quarter ahead, appears on Lietuvos bankas’ website (http://www.lbank.lt in the section “Statistics: Advance Release Calendar”) and on the IMF’s DSBB, which can also be accessed via a hyperlink from Lietuvos bankas’ website (under the section entitled “Statistics: Special Data Dissemination Standard”). The quarterly b.o.p. publication also contains a “rolling” advance release calendar, which provides precise release dates one quarter ahead. The data are released simultaneously to all interested parties by posting them on Lietuvos bankas’ website at the same time as the b.o.p. data are posted. A note informing the public that the data have been posted on the internet is published in each issue of Lietuvos bankas’ “Monthly Bulletin”.

Two weeks later, the b.o.p. and i.i.p. data are published in the quarterly bulletin “Balance of Payments of the Republic of Lithuania”.

With regard to reserve assets, Lietuvos bankas’ “Monthly Bulletin” and “Quarterly Bulletin” have contained end-of-month data for the current year, end-of-quarter data for the two previous years and end-of-year data for the following components since December 1992: gold; holdings of SDRs; the position in the IMF; and foreign exchange (securities, currency and deposits, reverse repos).

### 4 GOODS

#### 4.1 SPECIFIC FEATURES OF DATA COLLECTION

The primary data source is the foreign trade statistics prepared by Statistics Lithuania on the basis of data collected by the Customs Department on import and export declarations for goods. Since 1 May 2004, the Customs Department has started to collect surveys on exports and imports of goods which are used in the Intrastat system. The Customs Department then presents the customs declarations and surveys of importers and exporters to Statistics Lithuania.

#### 4.2 DEFINITION

The foreign trade volume is calculated on the basis of the General Foreign Trade Principles
and the definition of the General Trade System and recommended methods by the Statistical Service of the United Nations. All goods that enter the country (imports) and all goods that leave the country (exports) are registered.

The following items are considered imports:
- imports declared for use within the country;
- temporary imports for inward processing;
- imported goods after processing; and
- imports into customs warehouses.

The following items are considered exports:
- goods of Lithuanian origin;
- re-exports of goods after processing; and
- exports of goods from customs warehouses.

Merchandise exports and imports are recorded at the time of customs clearance and by filling in the monthly surveys. Temporary exports and imports, leasing goods and goods related to humanitarian aid are also included in the accounting item. Furthermore, besides customs data, trade in electricity and natural gas is also included in this item. The data on goods delivered to transport agencies at the ports are based on transport company reports.

Imports are also compiled on an f.o.b. basis. In this respect, Lietuvos bankas makes some adjustments in terms of freight (about 6% of total imports).

4.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

Lietuvos bankas makes some adjustments to foreign trade – part of which can be attributed to shuttle trade in goods and services – using commercial banks’ data on cash purchases of foreign currency.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on the services provided by resident non-financial enterprises to non-residents and the services provided by non-residents to Lithuanian economic entities are received on the basis of statistical research carried out by Statistics Lithuania (in the form of quarterly surveys). All categories of services are divided up in the questionnaire to Statistics Lithuania (see Sub-section 3.2 (i)), which enables the available data to be aggregated according to the standard groups of services as defined in the BPM5 and the extended classification of services by Eurostat and the OECD. More than 5,000 enterprises complete the said questionnaire. Approximately 75% of the answers to this questionnaire are completed. Monthly data on services are collected by Lietuvos bankas from selected Lithuanian economic entities.

5.2 DEFINITION

(i) Transportation

This category includes cargo and passenger transportation services using all means of transportation, including seaport and airport services. The primary data source is the quarterly survey of the cross-border transactions of non-bank entities with non-residents (F-06) conducted by Statistics Lithuania. The quarterly survey is supplemented by a comprehensive annual survey of small road transport operators covering their quarterly and annual transactions (F-17). Data are provided by approximately 1,000 enterprises.

(ii) Travel

Travel services include all goods and services acquired by travellers in foreign
countries (a person living in a country in which he/she is not a resident for less than one year is considered a traveller). Services in the area of international passenger transportation – i.e. the transportation of passengers between countries – are not included in the travel item. Such services belong to the category of passenger transportation services. Data on travel services are calculated on the basis of the monthly data on the number of incoming foreigners into and departing residents from Lithuania, as provided by the Border Police Department, and on the Department of Tourism’s selective research on incoming foreigners and their average expenditure and length of stay.

(iii) *Other services*

The main source of information on income and expenditure related to other types of services is a quarterly survey of cross-border transactions of non-bank enterprises conducted by Statistics Lithuania (F-06); in this survey, the economic entities submit data on receipts from and expenditure on such categories of services and payments abroad as construction, communications, finance, computers and information technology, royalties, insurance, government services, the acquisition of licences, leasing and business leases, other personal, cultural and entertainment services, other business services and other services. A quarterly survey of banks’ cross-border transactions on their own behalf is conducted by Lietuvos bankas (B-09-01) The largest amount of information on government services is received from the Ministry of Foreign Affairs and the Ministry of Finance. Information is based on the data on the expenditure of Lithuania’s embassies abroad and on salaries paid to Lithuanian employees working abroad, on technical assistance provided by non-residents and on quarterly data provided by the Lithuanian tax authorities on value-added tax refunds to embassies and international organisations. Additional information on various services is collected from other official sources.

5.3 **DEVIATIONS FROM AGREED DEFINITIONS**

None.

5.4 **GAPS**

None.

5.5 **INTENDED HARMONISATION**

None.

5.6 **ESTIMATION METHODS**

See Sub-section 4.6.

6 **INCOME**

6.1 **SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS**

Data on income are obtained from the monthly sample surveys and quarterly reports of non-banking enterprises and from the reports submitted by commercial banks, ministries and departments as well as Lietuvos bankas.

6.1.1 **COMPENSATION OF EMPLOYEES**

Information on compensation of employees is obtained from:

(i) quarterly information provided by the Post Office (on money orders, for instance);

(ii) quarterly data on social insurance contributions paid by non-exempt foreign embassies for resident employees in Lithuania;

(iii) reports of non-financial enterprises; and
6.1.2 INCOME ON DIRECT INVESTMENT

The main sources of data on direct investment income (expenditure) are:

(i) a quarterly survey of enterprises involved in direct investment, conducted by Statistics Lithuania (Form TUI-01); and

(ii) quarterly reports of commercial banks.

Income from direct investment means income calculated on behalf of a direct investor on the capital invested by him in the form of direct investments. This income comprises:

- dividends;
- distributed profits of foreign branches;
- reinvested earnings; and
- income (interest) on debt liabilities.

The total sum of dividends as of the date payable or paid (i.e. before tax) is reflected in the b.o.p. Dividends may be paid in cash or in shares (capitalisation of current income). Dividends on liquidation are excluded, since they reflect the return on invested capital and not a transfer of income. These dividends are shown as capital withdrawals. Where declared dividends have not been paid, the data presented as direct investments under other bank assets are increased by the respective sum.

Reinvested earnings are recorded in full for both inward and outward investment. Reinvested earnings mean that a direct investor’s profit (loss) is not distributed in the form of dividends but is retained by the enterprise concerned. Reinvested earnings are recorded for the period under review during which the respective profit was made (or loss incurred). They are calculated by deducting the tax due, the dividends payable (if declared) and the remuneration of board members from the profit made during the reporting period.

6.1.3 INCOME ON PORTFOLIO INVESTMENT

Income (interest) on portfolio investment includes income on preference shares that grant the right to receive additional payments within a fixed amount (these payments are not considered dividends and are treated as interest). This income also comprises:

- dividends on preference shares that do not grant the right to the assets of an enterprise in liquidation; and
- interest on other debt securities (bonds, bills, cheques and other similar liabilities).

The accruals principle is applied to income on portfolio investment on the basis of quarterly surveys.

6.1.4 INCOME ON OTHER INVESTMENT

This item comprises:

- interest on trade credits; and
- interest on loans.

Interest on loans also comprises interest on loans on behalf of the state, interest on loans guaranteed by the government and other investment expenditure (penalties, forfeitures).

The main sources of data on portfolio and other investment income are as follows: quarterly reports of non-financial enterprises, quarterly reports of banks and the information from the Ministry of Finance on interest paid on government debt securities, loans received on behalf of the state and guaranteed by the government.

6.2 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.3 GAPS

None.

6.4 INTENDED HARMONISATION

None.
6.5 ESTIMATION METHODS
None.

7 CURRENT TRANSFERS
Data are received from various government agencies and the banking sector. The primary sources of data are:

(i) monthly data on humanitarian aid provided by Statistics Lithuania;
(ii) monthly data on current transfers from abroad to government and other sectors provided by the Ministry of Finance. The Ministry of Finance and the Ministry of Foreign Affairs submit data on entry and membership fees paid by the Government to international organisations;
(iii) quarterly estimates of compensation of employees and workers’ remittances, based on data on cross-border transfers provided by the post office;
(iv) monthly data on cross-border pension receipts and payments, provided by the State Social Insurance Fund and by the commercial bank “Hansa bank”
(v) data on cross-border transactions by individuals, sports organisations, etc. obtained from a monthly survey of banks conducted by Lietuvos bankas (B-09-03).

Also see Sub-section 8.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The main sources of data are:

(i) monthly data on capital transfers to government and other sectors, provided by the Ministry of Foreign Affairs and the Ministry of Finance;
(ii) data on debt forgiveness transactions of other sectors, obtained from the quarterly survey of cross-border transactions of non-bank enterprises conducted by Statistics Lithuania (F-06); and
(iii) data on debt forgiveness transactions of banks, obtained from the quarterly survey of cross-border transactions of banks conducted by Lietuvos bankas (B-09-01).

8.2 DEFINITION

See Sub-section 8.1.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

No other items are recorded except those mentioned in Sub-section 8.1. Inter alia, there is no coverage of migrants’ transfers and the acquisition/disposal of non-produced non-financial assets.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The sources are:
(i) a quarterly survey of enterprises involved in direct investment, conducted by Statistics Lithuania (TUI-01);

(ii) quarterly data provided by the Ministry of Finance on direct investment arising from the privatisation of state-owned enterprises (the revenues of the Privatisation Fund);

(iii) monthly data provided by the local authorities on real estate sold to non-residents; and

(iv) monthly data on trading in equities provided by the Securities Commission.

With regard to (i), Statistics Lithuania’s consolidated quarterly and annual data on FDI (Lietuvos bankas collects banking sector data), Statistics Lithuania has devised a questionnaire on FDI in line with the OECD’s Detailed Benchmark Definition of FDI, which is circulated to more than 2,000 respondents four times a year. This questionnaire covers all components of FDI by direction of investment. It comprises resident direct investment abroad and non-resident direct investment in the Lithuania. Capital invested by a direct investment enterprise in its direct investor (reverse investment) is regarded as an offsetting item to capital invested by a direct investor and by related enterprises in the direct investment enterprise. In other words, such capital is considered “disinvestment” by the direct investor, rather than an asset of the direct investment enterprise. The data are available in full broken down by country and activity.

With regard to (ii), the Ministry of Finance provides data reported monthly, quarterly and annually, broken down by country and activity, on revenues received from non-residents for privatised entities in the Republic of Lithuania and on other subsidies and funds received from abroad (related to FDI).

Furthermore, the Central Securities Depository of Lithuania provides data reported quarterly and annually on how securities are distributed among Lithuanian economic entities and non-residents (in total and broken down by country and type of investor) as reflected in the accounting of intermediaries in public securities trading. The Securities Commission provides data on opening and closing positions by type of security and on receipts and payments from trading in equities (packets).

FDI data in the b.o.p. is broken down by geographical area (i.e. by country, namely EU 15, extra-EU 15, euro area, EFTA country, United States, Japan and Canada) and by economic activity (using ISIC/NACE codes corresponding to the economic activities used in the Eurostat/OECD codification for economic activity groups).

9.2 DEFINITION

Foreign direct investment is understood, in line with the methodology of the IMF and the methodological directions of Eurostat, as investment creating long-term economic financial relations and interests between a foreign direct investor and a direct investment company. According to the OECD’s Detailed Benchmark Definition of FDI, a holding of 10% of the voting rights is recognised as the lowest limit under which a foreign direct investor is able to participate in the management of a direct investment company. Foreign investment holdings of less than 10% of the voting rights are attributed to portfolio investment, instead of to direct investment. Not only primary capital investment is attributed to foreign direct investment, but also all later transactions between the investor and the direct investment company. Foreign direct investments consist of stock capital (shares valued at market price), reinvested earnings (the proportion of profit (loss) directly attributed to a foreign investor that was not distributed in the form of dividends during the period under review and remained in the company) and other capital (liabilities between the foreign direct investor and the direct investment company in borrowing and lending assets).
Foreign investors are understood to be foreign enterprises (legal persons) other than citizens of Lithuania (natural persons), or persons without citizenship, permanently residing abroad, whose capital at the time of investment is of foreign origin and who invest in the Republic of Lithuania.

Investments are understood as monetary funds and tangible, intangible and financial assets appraised in the manner established by laws and other legal acts, invested with a view to earning profit (income) from the object of investment. Investing means actions by investors whereby they acquire the right of ownership or of creditors against the investment object, or the right to manage and use this object.

Investors are understood as the Republic of Lithuania and foreign states, international organisations, legal and natural persons of the Republic of Lithuania, as well as enterprises without the rights of a legal person, who, in accordance with the procedures established by the law of the Republic of Lithuania, invest their own borrowed assets in trusts. Strategic investors are investors with whom the Government of the Republic of Lithuania, or an authority empowered by it, enters into an investment contract. Investment objects are understood as the ownership capital of an economic entity, all types of securities, fixed assets and long-term intangible assets.

In compliance with both the Law on Commercial Banks of Lithuania and the Companies Act, paid-up but not registered capital does not entail any awarding of property and non-property rights to a shareholder, so that the said capital may not be attributed to direct investment. It is treated like other liabilities and entered under other investment (portfolio investment, other investments). Other bank assets and other liabilities with respect to direct investment comprise:

- other debt securities (including preference shares that do not award any right to an enterprise’s assets upon its liquidation);
- loans (when a direct investor awards a loan to a subsidiary enterprise, or vice versa);
- overdue loans (if their maturity is not extended);
- liabilities on goods and services, other financial assets and other liabilities to non-residents;
- calculated but unpaid dividends; and
- interest on loans (if not paid out).

9.3 DEVIATIONS FROM AGREED DEFINITIONS

Private non-business real estate investment is not included.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Estimates are necessary in order to record some of the flows and stocks of stock companies which are not fully covered by the usual reporting system of Statistics Lithuania. In particular, if a new stock company is established in Lithuania, it is obliged, under the procedures for the registration of joint ventures and foreign capital enterprises, to deposit 25% of its total registered foreign capital with a Lithuanian bank. Since these flows are not captured by the usual reporting system of Statistics Lithuania, Lietuvos bankas has to estimate these flows.

The estimation methods applied are as follows:

(i) Lietuvos bankas counts final FDI indicators – flows and stocks – on the basis of collected data. From Statistics Lithuania, Lietuvos bankas receives aggregated reports on FDI and, separately, the same kind of data on joint stock companies and commercial banks.
ECB c
EU and accession countries’ balance of payments statistical methods
November 2004

(ii) Lietuvos bankas uses data on foreign investment (buying and selling) in resident equity capital from the Central Securities Depository and Lithuanian Securities Commission. Although these data do not distinguish between FDI and portfolio investment and although the coverage of economic entities is lower, they indicate transactions with non-residents at market prices.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The primary sources of data are:

(i) the quarterly survey of cross-border transactions of non-bank enterprises, conducted by Statistics Lithuania (F-06);

(ii) the monthly and quarterly surveys of cross-border transactions of banks, conducted by Lietuvos bankas (B-09-02 and B-09-01 respectively);

(iii) information from the Ministry of Finance on the government’s cross-border transactions in debt securities; and

(iv) data obtained from the Central Securities Depository and the Lithuanian Securities Commission on the distribution of securities (including government securities). These data are obtained from the accounts of intermediaries on transactions in securities between residents and non-residents.

Furthermore, investments in securities are reflected in the special monthly reports of intermediaries, which are requested under the General Regulations on Accounting for Investments in Securities in Credit Institutions (Resolution No 253 of the Board of Lietuvos bankas of 20 November 1997).

Portfolio investment stocks are broken down further by instrument, sector, country (since the first quarter of 2004) and maturity.

10.2 DEFINITION

Portfolio investment is understood as foreign investment involving less than 10% of the voting rights and no extensive powers in corporate management decisions. Portfolio investment comprises acquired debt securities (shares confirming the participation of holders thereof in the capital and awarding less than 10% of the voting rights) as well as market and investment securities (bonds, bills, promissory notes, certificates of deposits, etc.) that confirm the issuer’s debt and that will be repurchased within a certain time-frame.

In compliance with the b.o.p. compilation methodology, the remaining proportion of equity (including reserves) that awards property rights to a shareholder is excluded from portfolio investment.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

None.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The sources of data are as follows:
(i) the quarterly survey of cross-border transactions of non-bank enterprises conducted by Statistics Lithuania (F-06); and

(ii) the monthly and quarterly surveys of cross-border transactions of banks conducted by Lietuvos bankas (B-09-02 and B-09-01 respectively).

Banks account for financial derivatives in off-balance sheet items: amounts receivable are shown as off-balance-sheet claims, whereas amounts payable are shown as off-balance-sheet liabilities. Financial derivatives are accounted for when they are created or sold, or when other actions provided thereunder are effected. Purchase (sale) transactions are accounted for at the market value.

11.2 DEFINITIONS

Included are foreign exchange purchases (sales), interest rate, precious metals and liability-related financial derivatives transactions (forwards, swaps, futures and options).

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The sources of data are as follows:

(i) the quarterly survey of cross-border transactions of non-bank enterprises conducted by Statistics Lithuania (F-06);

(ii) the monthly and quarterly surveys of cross-border transactions of banks conducted by Lietuvos bankas (B-09-02 and B-09-01 respectively);

(iii) information from the Ministry of Finance on government loans received (and repaid) on behalf of the state and guaranteed by the Government; and

(iv) the monthly survey of non-bank enterprises conducted by Lietuvos bankas (B-09-04).

Breakdowns are available by sector, instrument, country (since the first quarter of 2004) and maturity.

12.2 DEFINITION

Other investment is classified by the type of financial instrument: deposits and cash, loans, debts for goods and services and other financial assets and liabilities that are not attributed to direct investment and portfolio investment.

Other investment of the banking sector is understood as all remaining financial operations, other than those included in direct investment and portfolio investment. They comprise liabilities for goods and services, loans, cash and deposits, as well as other assets and liabilities. Liabilities for goods and services are understood as financial claims and liabilities arising when goods and service flows differ from the time of actual settlement.

Loans cover all loans granted by banks to non-residents as well as loans received from non-
residents (excluding loans raised on behalf of the state and guaranteed by the Government). Loans also include leases, repos and overdrafts. In the case a lease, the lessee covers expenditure incidental to the acquisition of goods. Other investment reflects the payment of the principal, whereas income and expenses are treated as interest payable or receivable on the lease. In accordance with their economic intent, repos are attributed to collateralised loans, in which case the seller of securities grants the buyer a certain sum of money which is guaranteed by securities for the period of validity of the agreement, and subsequently, upon repurchase of the securities, receives interest on the fixed price. As a rule, ownership of the securities does not change and the seller does not have the right to sell them.

Cash and deposits comprise cash in foreign currency and travellers’ cheques in banks (shown only in the financial assets part of commercial banks’ monthly statements), demand deposits and correspondent account balances with foreign banks. Time deposits are attributed to loans for the purposes of the b.o.p.

Other assets and other liabilities cover operations not included in the aforementioned items. Other assets include non-resident loans that have not been repaid or extended, as well as outstanding dividends and interest, whereas other liabilities comprise outstanding loans to non-residents, outstanding dividends, etc. In line with both the Law on Commercial Banks of Lithuania and the Companies Act, paid-up but not registered capital of banks may not award property or non-property rights to a shareholder; therefore, this capital is attributed to other investment and is entered under other liabilities in commercial banks’ monthly statements. This item includes credit or debit liability (i.e., miscellaneous payable and receivable accounts).

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The data sources are as reported in Lietuvos bankas’ balance sheet and in the government accounts with the IMF.

13.2 DEFINITION

Reserve assets are external assets that are readily available to and controlled by monetary authorities for the direct financing of payment imbalances, for indirectly regulating the magnitude of such imbalances through intervention in exchange markets to affect the exchange rate and/or for other purposes.

Reserve assets refer to liquid, marketable and creditworthy foreign currency-denominated claims (consisting of foreign exchange and deposits, securities and reverse repos) on non-residents plus monetary gold, holdings of SDRs and the reserve position in the IMF.

The reserve assets are under the effective control of the monetary authority. Reserve asset data comprise the official reserves of Lietuvos bankas and government claims on the IMF. Reserve template data also cover the activity of the central government, excluding social security funds.

Positions vis-à-vis residents and positions in non-convertible and local currencies vis-à-vis non-residents are excluded.
Reserve assets are compiled in accordance with the gross concept, without any netting with monetary authority liabilities.

Foreign assets in non-convertible currencies, as well as all other assets that do not meet the reserve assets concept are excluded.

Lietuvos bankas does not perform reversible transactions with gold, but such transactions would be treated as collateralised loans.

At present, there are no financial derivative positions to be included in the reserve assets item.

Since December 2001, gold holdings has been revalued once a month on the last working day at the value of the London gold price fixing. Holdings of foreign exchange (cash) are revalued on a daily basis. Securities are revalued once a month on the last working day using the mid-market prices prevailing on the secondary markets. The value of the securities at the reference date includes accrued interest.

### 13.3 DEVIATIONS FROM AGREED DEFINITIONS

Securities are compiled and reported in the b.o.p. on an aggregate basis, i.e. securities are not broken down into equities, bonds and notes, money market instruments and financial derivatives.

### 13.4 GAPS

At present, there are no transactions that cannot be covered by the reporting system.

### 13.5 INTENDED HARMONISATION

A new Lietuvos bankas accounting information system is being developed. It is planned to introduce the system fully in 2007. The introduction of this new system will remove the existing deviation from BPM5 requirements observed for the standard reserve asset components.

### 14 INTERNATIONAL INVESTMENT POSITION

#### 14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

#### 14.1.1 GENERAL

Lithuania’s i.i.p. is compiled on a quarterly basis and becomes available 12 to 13 weeks after the end of the reference quarter. The data on the i.i.p. are disseminated in Lithuanian litas (LTL), euro (EUR) (since 2002, data for 2001 are also available) and US dollars (USD) for each of the standard components according to the BPM5. The i.i.p. is compiled on the basis of real stock data.

The i.i.p. is compiled separately for assets and liabilities. The foreign assets component includes direct investment abroad, portfolio investment, other investment and reserve assets. The foreign liabilities component includes direct investment in Lithuania, portfolio investment and other investment. Portfolio investment is broken down further by instrument, namely into equity securities and debt securities, and other investment is subdivided into trade credits, loans, foreign exchange and deposits, other assets and liabilities.

The data on the assets and liabilities positions are broken down further by sector (Lietuvos bankas, commercial banks, non-financial enterprises and government) and show the position as at the end of the reference period. The methodology used to compile the i.i.p. data is based on the BPM5. A country breakdown is also available.

**Scope of the data**

(i) Institutional coverage:

- banks: all banks are included;
- non-banks: information on the financial and commercial relations of all national economic entities, irrespective of the form of ownership, with non-residents. Currently, data are collected from around 6,000 enterprises.
(ii) Geographical coverage:
since the first quarter of 2004, a data breakdown by country has been available.

*Accounting conventions*
(i) Conversion to unit of account:
data are reported in LTL, in accordance with the Accountancy Act.

(ii) Valuation:
transactions are generally recorded at market prices.

*Compilation practices*
(i) Verification and other practices:
all i.i.p. components are analysed both for internal consistency and for consistency over time. In addition, data are reconciled with those obtained through other sources and statistical frameworks.

(ii) Adjustments to improve coverage/classification/timing/valuation:
no adjustments are made to the values Lietuvos bankas obtains from commercial banks, enterprises and Statistics Lithuania.

**14.1.2 DIRECT INVESTMENT**
Direct investment data are derived from quarterly reports from enterprises and commercial banks. For further details on data collection, see Sub-section 9.1.

In principle, the basis for valuation is the market price, but a market price is often not available for enterprises whose shares are not quoted on the stock exchange. In practice, the book value is used to determine the proportion of the value of the direct investment stock.

Lithuania uses the *directional principle* for the calculation of FDI, which is in line with the BPM5. All transactions by the direct investor with the direct investment enterprise are *FDI abroad* and all transactions by the direct investment enterprise with the direct investor are *FDI in the reporting economy*. Capital invested by the direct investment enterprise in its direct investor (reverse investment) is regarded as an offsetting item to capital invested in the direct investment enterprises by a direct investor and its related enterprises. In other words, such capital is regarded as *disinvestment* by the direct investors, rather than as an asset of the direct investment enterprise.

Direct investment is broken down by country and activity.

Lietuvos bankas carries out adjustments for changes in exchange rates, as well as other adjustments.

**14.1.3 PORTFOLIO INVESTMENT**
The primary sources of portfolio investment stock data are the quarterly reports of enterprises and commercial banks as well as the data of the Central Securities Depository of Lithuania on the distribution of securities (including Government securities). These data are obtained from the accounts of intermediaries on transactions in securities between residents and non-residents. Portfolio investment stocks are broken down further by instrument, sector, maturity and (since the first quarter of 2004) by country.

For further details, please see Sub-sections 10.1 to 10.6.

**14.1.4 FINANCIAL DERIVATIVES**
Stocks for financial derivatives (assets and liabilities) are compiled separately.

**14.1.5 OTHER INVESTMENT**
The primary sources of data are the quarterly reports from enterprises and commercial banks, as well as data from Lietuvos bankas and the Ministry of Finance.

**14.1.6 RESERVE ASSETS**
The primary source of data is Lietuvos bankas’ accounts. The data are compiled monthly for both official foreign reserves and for the reserves template. Data on the reserve assets become available within a week after the end of
the reference month with respect to the official foreign reserves and within a month after the end of the reference month with respect to the reserve template.

The gross official reserves data are fully reconciled with the b.o.p. data; both sets of data are published in the “Quarterly Bulletin”. Historical data on gross official reserves and major reserve-related liabilities of Lietuvos bankas can be found on the bank’s website (http://www.lbank.lt).

Data on the total gross official foreign reserves are disseminated in USD millions. The data cover the reserves of the central bank and the position in the IMF, and are based on the accounting records of Lietuvos bankas. The data are published with the following breakdown by instrument and currency:

- gold;
- convertible foreign currency (securities, currency and deposits and reverse repos);
- holdings of SDRs; and
- the position in the IMF.

International reserves are measured from stocks of claims on non-residents.

International reserves are valued at current market prices. Data on deposits with foreign banks do not include interest accrued but not yet credited to Lietuvos bankas’ accounts.

Monetary gold holdings are revalued once a year on the last working day, at the lowest value of the London gold fixing during a year, if this value is lower than the book value. Most recently, the gold holdings were revalued at USD 252.8 per fine ounce at the end of 1999. Holdings of foreign exchange (cash) are revalued on a daily basis. Coupon-bearing securities are revalued once a month on the last working day and discount securities are revalued once a year on the last working day using the bid prices prevailing on the secondary markets. The value of securities on the reference date includes accrued interest.

Data are converted into LTL or USD equivalents on the basis of the official exchange rates announced by Lietuvos bankas.

Since the end of April 2000, Lithuania has disseminated data on the international reserves and reserve-related liabilities in the Data Template on International Reserves and Foreign Currency Liquidity (IMF Data Template). The IMF’s Operational Guidelines provide the metadata for both the official reserve assets and the complete reserves template. For the template, stocks of major reserve-related liabilities of Lietuvos bankas are published, including banks’ required reserves in foreign currency, central government deposits in foreign currency, IMF loans to Lietuvos bankas and repos.

Reserve assets data comprise the official reserves of Lietuvos bankas and government claims on the IMF. Template data also cover the activities of the central government, excluding social security funds. Foreign assets in non-convertible currencies, as well as all other assets that do not meet the definition of reserve assets, are excluded. At present, there are no financial derivatives positions to be included in the reserve assets.

14.2 DEVIATIONS FROM AGREED DEFINITIONS

None.

14.3 GAPS

In direct investment, private non-business real estate investment is not included.

14.4 INTENDED HARMONISATION

None.

14.5 ESTIMATION METHODS

None.
15 CONTACTS

This country information was drafted by Lithuania in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Lithuania should be addressed to:

Mr Alfredas Jancaitis  
Deputy Head of the Balance of Payments and External Reserves Statistics Division  
Monetary Policy Department  
Lietuvos bankas  
6 Gedimino Ave.  
2001 Vilnius  
Lithuania

Fax: +370 2 68 04 26  
E-mail: ajancaitis@lbank.lt
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Until 31 December 2001, information on external payments in Luxembourg was collected by the Institut belgo-luxembourgeois du change (IBLC), which received data mainly from credit institutions. These data served to establish balance of payments (b.o.p.) statistics for the Belgian-Luxembourg Economic Union (BLEU). At the beginning of Stage Three of Economic and Monetary Union, the Governments of Luxembourg and Belgium took the decision to terminate the activities of the IBLC on 1 January 2002. From that date onwards, Belgium and Luxembourg have established separate b.o.p. accounts.

2.2 LEGISLATIVE PROVISIONS

The regulations currently in force are the Grand-Ducal Decree of 10 November 1944 (as amended), which relates to exchange controls, the Grand-Ducal Execution Regulation of 19 July 1997, which relates to foreign payments and the b.o.p., and the Ministerial Decree of 13 November 1998, which relates to the publication of the IBLC rules to be applied by the reporting agents.

In 2000, some changes were made to the above-mentioned Grand-Ducal Decree. Under the law, dated 28 June 2000, modifying the Grand-Ducal Decree of 10 November 1944 (as amended), the Banque centrale du Luxembourg (BcL) and the Service Central de la Statistique et des Etudes économiques (STATEC) are jointly responsible for establishing the b.o.p. The elaboration of a data collection system, including the associated methodology, concepts and definitions, has been established by common agreement.

The Banque centrale du Luxembourg is responsible for establishing the financial account and Luxembourg’s international investment position (i.i.p.), as well as for the evaluation of the investment income statement.

The Banque centrale du Luxembourg is also in charge of the information system for data management. STATEC is responsible for establishing the capital account and the current account (with the exception of the investment income item), as well as for the survey on foreign direct investment positions.

The following table summarises the allocation of responsibilities between the two institutions:

<table>
<thead>
<tr>
<th>Area of responsibility</th>
<th>Institution in charge</th>
</tr>

<tr>
<td>Financial account</td>
<td>BcL</td>
</tr>
<tr>
<td>Foreign direct investment survey</td>
<td>STATEC</td>
</tr>
<tr>
<td>International investment position</td>
<td>BcL</td>
</tr>
</tbody>
</table>

STATEC and the Banque centrale du Luxembourg have decided that relations with the reporting agents belonging to the financial sector are the responsibility of the Banque centrale du Luxembourg, whereas all remaining reporting agents are the responsibility of STATEC.

2.3 INTERNAL ORGANISATION

(i) Banque centrale du Luxembourg

The Statistics Division of the Banque centrale du Luxembourg is in charge of establishing statistical data in the area of the b.o.p./i.i.p. and the money and banking statistics. The Balance of Payments Section of the Statistics Division has developed the technical infrastructure necessary to compile the Luxembourg b.o.p. and i.i.p. for data collected as from 1 January 2002. The section has also communicated the new reporting requirements to the reporting agents of the financial sector and maintains contacts with them. It is also in charge of compiling those components of the b.o.p. for which the Banque centrale du Luxembourg is responsible (see shared responsibility with STATEC).
STATEC is responsible for centralising all statistical information and for coordinating Luxembourg’s statistical system. STATEC is represented in the main decision-making bodies at the level of the European Commission (Eurostat).

STATEC comprises four divisions, one of which – the External Economic Statistics Division – was already responsible from 1995 to 2001 for compiling foreign direct investment stock data and the b.o.p. current account of Luxembourg. Since 1 January 2002, this division has been in charge of compiling those components of the b.o.p. for which STATEC is responsible (see shared responsibility with Banque centrale du Luxembourg) and establishing and maintaining contacts with reporting agents of the non-financial sector.

2.4 EXTERNAL COOPERATION

See Sub-sections 2.3 and 2.5.

2.5 USERS

The national compilers – the Banque centrale du Luxembourg and STATEC – are responsible both for reporting to international organisations and for publishing all related statistics. The Banque centrale du Luxembourg mainly reports to the ECB, the International Monetary Fund (IMF), and the Bank for International Settlements (BIS). STATEC liaises with EUROSTAT, the Organisation for Economic Co-operation and Development (OECD) and the UN Division for Statistics.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The present system is based on the principles of the reporting system used by the defunct IBLC. The collection system used to report statistical data for the b.o.p. is an “international transactions reporting system (ITRS) of the open type”, which is largely based on the collection of settlements. Credit institutions have to inform the Banque centrale du Luxembourg of foreign payments made on behalf of their resident customers as well as those realised for their own account. Residents who make external transactions without payments or which are settled without resorting to resident credit institutions must declare these transactions either to the Banque centrale du Luxembourg or to STATEC, depending on the sector they belong to.

The compilers also make use of different other sources. For some components of the current account, administrative sources are used:

- compensation of employees (social security information);
- transactions with European institutions;
- insurance data from the supervisory authority for insurance companies.

Furthermore, a quarterly household survey is used to compile the travel items (outbound).

The flows of the MFI sector relating to portfolio investment and other investment, are derived from the balance sheets of MFIs.

Furthermore, for portfolio investment, some flow data are adjusted on the basis of specific statistics from general government and from the mutual fund sector. In addition, for flows of direct investment, some adjustments are made on the basis of information taken from specialised media. Data on direct investment transactions executed without direct cash payments are collected through an administrative source, i.e. the official publication in the legal notice Memorial C.

Within the framework of the i.i.p., stock data are used for the banking sector and general
government, as well as stock exchange information for the adjustment of prices relating to portfolio investment.

For the reserve assets component of the b.o.p., as well as for the IMF template on international reserves and the corresponding i.i.p. components, data are provided directly by the Accounting Section of the Banque centrale du Luxembourg.

The collection system can be summarised as a four-pillar system comprising:

- direct reporting;
- administrative sources;
- other statistical sources (e.g. trade, travel, MFI balance sheet statistics); and
- settlements information for all transactions not covered by the first three sources.

For the time being, this four-pillar approach seems to be the optimal combination in order to reach best quality for statistics and lowest burden for respondents.

### 3.2 REPORTING AGENTS

(i) **Banks**: These are banks and other financial institutions, as defined in the Second EU Banking Directive. Coverage is extended to include non-bank institutions so as to cover the Monetary Financial Institution (MFI) sector. The “Comptes Chèques Postaux” of Luxembourg (CCPL), is assimilated to a financial institution for b.o.p. reporting purposes. Banks are required to report external transactions undertaken on behalf of their resident customers and for their own account (also see Sub-section 3.3). These reports are of the “open” type and are generally established on a daily basis and in the original currencies.

(ii) **Direct respondents**: Enterprises have to report directly to the Banque centrale du Luxembourg or STATEC all external transactions made through a channel other than resident credit institutions. This reporting covers bank accounts abroad, netting procedures and current accounts. General direct respondents (GDRs) report directly to the Banque centrale du Luxembourg or STATEC on all transactions with non-residents. These reports are denominated either in the original currencies or in euro.

(iii) **Monetary authorities**: The Banque centrale du Luxembourg provides data on reserve assets and other transactions of the monetary authorities.

---

</table>
Within the framework of the relevant legislation, the Banque centrale du Luxembourg and STATEC are authorised to organise surveys for the compilation of the b.o.p./i.i.p. At the moment, two surveys are being carried out, namely one on trade credits and one on foreign direct investment (inwards and outwards), which covers stock and flow data on equity capital, results, dividends, loans, interest payments and commercial credits, as well as some other economic data on each direct investment relationship.

3.3 THRESHOLDS

Exemption and justification thresholds are applied in the Luxembourg collection system.

An exemption threshold of €12,500 is applied to both inward payments and outward payments. Below this threshold, no reporting is required for transactions by third parties settled through banks. For transactions above this exemption threshold, the identification of the resident transactor, the economic nature, the currency and the amount of the transaction, as well as the country of residence of the counterpart have to be reported. For reports on outgoing payments, written justification is required for amounts in excess of €12,500, given that this information should be readily available as customers have to fill in a payment order for the bank. In view of the fact that written justification is far more burdensome in the case of incoming payments, the threshold for written justification is €625,000.

3.4 AVAILABILITY OF DATA

Quarterly and annual b.o.p. data for Luxembourg are available from January 2002 onwards. Quarterly results of the current account (without a geographical breakdown) are available from 1995 onwards.

The Luxembourg b.o.p. (quarterly and annual data) includes most of the major IMF standard components.

3.5 TIMELINESS

The reporting banks have to submit their daily reports within five working days. Direct respondents have 15 working days after the end of the reference month to submit their reports. Some adjustments are made to cover any missing data whenever direct respondents are late in sending their reports. A similar procedure is followed for the banking statements. This procedure enables the Banque centrale du Luxembourg to respect the six-week time-lag granted by the ECB for the submission of the data on monthly b.o.p.

3.6 COMPILATION FREQUENCY

A monthly b.o.p. is compiled for ECB purposes only. The statistical tables are published on a quarterly basis.

3.7 DATA CONTROLS

Data are checked within the workstation for validation purposes, as well as at the technical level to verify their content (adequacy, completeness, etc.) and cohesion. These controls consist of checking, inter alia, the accuracy of the identification number and of certain cross-checks (transaction, country and currency codes). Corrections can be made to the individual data stored on the server, as well as on a more aggregated level. All manual corrections to received data are included in the individual audit trail of the particular transactions reported.

Individual controls are carried out on a transaction-by-transaction basis. These controls consist of an evaluation of a selection of individual transactions, based on ad hoc criteria for each item, the result of which may be corrections. Plausibility analyses are also carried out for each b.o.p. component at two levels: by transaction code (time series) and by respondent (on the basis of its profile).

Comparisons between flows and stocks for MFI and CII (collective investment institution) issues
are made on a monthly basis. For portfolio investment assets and for all sectors, the comparison is carried out on a quarterly basis.

3.8 REVISION POLICY

Data revision is a continuous process. Individual records can be updated on a daily basis. These updates can be tracked in detail via historical files. Aggregated data for dissemination are currently revised as follows.

Monthly figures are produced within six weeks, in order to fulfil the requirements of the ECB. The revision process is carried out at quarterly and annual frequency. The revision of a year or a quarter involves the revision of every month concerned.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The monthly b.o.p. data are available within the six-week time period; however, these data have a lower degree of reliability and coverage and are completed, if necessary using estimates for missing respondents.

The level of the reporting provided by banks and direct respondents in the field of flow data is satisfactory considering the six-week deadline.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

Trade statistics are used for the “goods” component of the b.o.p. These trade statistics are not taken over as such, but are adjusted in order to adapt them to BPM5. Missing data are estimated and imports are valued on an f.o.b. basis. There is no seasonal adjustment.

4.2.2 FOR SERVICES

Financial services are included on the basis of the settlement system plus estimates for commissions and administration fees on CIIs assigned to non-resident investors.

For travel, the main sources are surveys, other statistics and administrative sources.

The other services items are mainly covered by settlement data, other statistics and administrative sources.

4.2.3 FOR INVESTMENT INCOME

The procedure for estimating reinvested earnings is mainly based on the survey of foreign direct investment, which is an annual survey. The procedure aims at fixing the rate of reinvested earnings to be applied to the total direct investment figure.

Income on trade credits is estimated on a monthly basis using quarterly stocks and

<table>

3.9 PUBLICATION

The current national presentation of the Luxembourg b.o.p. is, in principle, in line with the fifth edition of the IMF Balance of Payments Manual (BPM5).

Publication of complete b.o.p. figures began on a quarterly basis in 2002.

The figures for the Luxembourg b.o.p. are available on the Banque centrale du Luxembourg and STATEC websites (www.bcl.lu and www.statec.lu respectively).

The main users of the b.o.p./i.i.p. data are the Banque centrale du Luxembourg’s Economic Research Section, STATEC’s National Accounts Division, STATEC’s “service de conjoncture”, international organisations, banks, ministries, professional associations, embassies, researchers and students.
monthly benchmark yields. As separate data on stocks are available for affiliates and non-affiliated enterprises, the resulting incomes are included respectively in direct investment income and other investment income.

Income on portfolio and other investment results from the same method as follows:

- detailed monthly stock positions for banks and CIIs, broken down by country and instrument, are based on monthly, quarterly and yearly sources;

- monthly benchmark yields, broken down by country and instrument, are applied to the detailed stocks for the estimation of income.

The treatment of investors’ income in the resident CIIs differs from this principle. The total income of CIIs (i.e. all income, including that of residents) is attributed to the investors. The geographical breakdown is based on the trading country and on an estimation for the part traded in Luxembourg to non-resident investors.

The income of the government and the central bank is available from administrative sources.

The income of other sectors, except for that of CIIs, is provided by the ITRS.

4.2.4 FOR DIRECT INVESTMENT
See Sub-section 7.1.

4.2.5 FOR PORTFOLIO INVESTMENT
The figures are based on the settlement data collected via the ITRS and received via direct reporting agents.

4.2.6 FOR FINANCIAL DERIVATIVES
For financial derivatives and other investment, no specific estimates are made. The available data are taken from the ITRS, in which ad hoc transaction codes are identified in order to isolate those components. No further adjustments are made to ensure that derivatives fulfil the required methodology for options and futures.

4.2.7 FOR OTHER INVESTMENT
The figures are based on the settlement data collected via the ITRS and MFI balance sheets. The ITRS provides data on the MFI sector and other sectors (excluding the central bank and the government) as a whole. The allocation between both sectors is obtained according to MFI balance sheets.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
The reporting system is based on a sectoral approach in order to focus on the main entities involved in b.o.p. income. These entities are the resident banks and CIIs for which monthly stocks are available. Specific sources for government, the Banque centrale du Luxembourg and other residents complete the data collection system for income.

5.1.2 INCOME ON DIRECT INVESTMENT
Reinvested earnings are included. The estimate of dividends is based on the calculation of gross dividend yields for the major partner countries, as applied to existing stocks of equity capital.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
Income is calculated on the basis of stock data, together with benchmark yields on a monthly basis (see Sub-section 4.2.3). Taking into account the calculation process, all instruments are treated in the same way, i.e. there is no specific treatment for different types of bonds (e.g. zero-coupon bonds or indexed bonds).

Income on resident CIIs is compiled on the basis of stock data. The total income of CIIs is attributed to the investors (see Sub-section 4.2.3).

The geographical breakdown on the credit side is mainly made according to the residency of the issuer. On the debit side, flows are allocated to the trading country of the securities. An exception is made for resident holders other
than CIIs in the other sectors, for which the geographical breakdown is done accordingly to the country of payment.

5.1.4 INCOME ON OTHER INVESTMENT
For the loan and deposit components of other investment, income is computed in the same way as for portfolio investment. Furthermore, certain income transactions are not registered, such as the share of interest in financial leasing.

5.2 DEFINITIONS
Definitions are in line with the BPM5, except for the deviations set out in Sub-section 5.3. All financial derivatives are treated as such, including those on interest rates. Dividends are recorded as of the date they are payable.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
A deviation relates to income on bonds and notes between affiliates, which is recorded as portfolio investment income since the underlying transactions in the financial account cannot be recognised as direct investment transactions.

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
None.

5.6 ESTIMATION METHODS
See Sub-section 4.2.3.

6 CAPITAL ACCOUNT
6.1 SPECIFIC FEATURES OF DATA COLLECTION
Data collection forms part of the general reporting system (see Sub-section 3.2). For capital transfers, extensive use is made of administrative sources.

6.2 DEFINITION
The definition of the capital account is in line with the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor. The distinction between current and capital transfers is made by using different transaction codes in the collecting system, in line with the BPM5 criteria.

6.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

6.4 GAPS
None.

6.5 INTENDED HARMONISATION
None.

7 DIRECT INVESTMENT
7.1 SPECIFIC FEATURES OF DATA COLLECTION
At present, direct investment in the b.o.p. is computed on the basis of the information collected via the ITRS, where specific transaction codes are used. Furthermore, the data from the ITRS are compared with the banking statistics – in order to improve the quality of the data for the banking sector – and with balance sheet data and media information with a view to increasing coverage and quality.

Geographical allocation is based, in principle, on the country of settlement. However, in order to identify the split between intra-euro area and extra-euro area transactions, reporting agents are requested to take into account the actual residency of the non-resident counterpart.

A yearly survey is organised on foreign direct investment abroad and in the reporting economy. Here, the debtor/creditor principle is
fully applied, with the information being collected for each individual direct investment relationship. In the event of a change of ownership of a resident company from a non-resident to another non-resident direct investor being revealed by the survey, the change is recorded in the FDI stocks, but not in the corresponding b.o.p. flows. The survey conducted covers not only direct investment stocks, but also other components (earnings, reinvested earnings and distributed earnings as well as income on debt and Foreign Affiliated Trade Statistics (FATS)). The survey is also useful for reconciliation purposes. The information obtained from the survey is expected to rectify most of the deviations and to fill the gaps mentioned, with the exception of transactions in bonds between affiliates. Corrections of flows are made on the basis of the survey results, except in the case of bonds.

Transactions on equity capital made without any settlement are registered directly by the b.o.p. compilers. The valuation of those transactions is based on official publications, if available (a prospectus is a statutory requirement when a transaction is public), specialised media information and stock exchange data.

Direct investment transactions settled through an exchange of shares are recorded at the time when the exchange of shares takes place.

Valuation of transactions settled through an exchange of shares is based on the official estimates of the market price published by the parties involved.

7.2 DEFINITION

In principle, Luxembourg plans to comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor.

The definitions of the different concepts used in direct investment statistics are in line with the BPM5 and the OECD benchmark (threshold of 10% ownership, direct investor, direct investment enterprise, direct and indirect relationship).

Cross-border transactions in real estate are covered.

Special purpose entities (SPEs) are considered to be ordinary enterprises, regardless of the type of transactions in which they engage.

Following the international conventions, inter-company transactions of SPEs principally engaged in financing activities are excluded from direct investment flows and allocated to the other investment component.

For equity capital, the main information is based on the related settlements. Those data are completed, in some cases, by using information from specialised newspapers or other documentary sources, or by using the direct investment survey results, in order to adjust the equity capital and inter-company loans item for transactions carried out without any settlement.

Trade credits between related enterprises, as well as loans or deposits, are included regardless of their maturity, and cash management transactions are covered as far as required.

Offsetting entries for reinvested earnings (with a MFI/non-MFI split) are included.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

Transactions on bonds and notes between related enterprises are not included in direct investment, but rather in portfolio investment.

7.4 GAPS

None.

7.5 INTENDED HARMONISATION

None.
7.6 ESTIMATION METHODS

The information content of the quarterly data is similar to that of the monthly data. No specific estimates are made.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The source for data collection on portfolio transactions is the ITRS (settlement data). The codification used for these transactions is based on a classification by instrument, by country of issuer (Luxembourg, euro area or non-euro area) and by maturity (up to one year or more than one year). The euro area/non-euro area split has been produced since mid-1998, but it is not possible to differentiate between Belgian and Luxembourg holders of those instruments prior to January 2002.

The geographical allocation on the liabilities side follows the transactor principle (first counterpart of the settlement) in full. For the assets side, two types of information are available: the first counterpart, as in the case of liabilities, and the issuer in an aggregated way (euro area/non-euro area split).

For the MFI sector, flows are derived from the available stock data where the allocation is made by country of issuer for assets.

For the general government sub-component, data are obtained from the Treasury Administration.

There is no separate reporting system for transactions settled through financial centres, custodians, etc.; they have to be reported within the framework of the ITRS. Within Luxembourg, one important clearing house operates, namely Clearstream Banking SA. A large number of transactions pass through that clearing house. When Clearstream acts as custodian, it intervenes in the transactions as counterpart for both sides of the transaction involved; this should theoretically result in large flows with other countries and should have a serious impact on the geographical allocation in a number of countries as well. However, in the national presentation of the b.o.p., without the geographical breakdown, those transactions relating to the role of Clearstream as intermediary between non-residents are neutralised.

Finally, trading in loan portfolio (securitisation of loans) is classified under portfolio investment.

8.2 DEFINITION

In general, the Banque centrale du Luxembourg and STATEC comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor and to the final report of the Task Force on Portfolio Investment Collection Systems.

For securities, the split between domestic and foreign securities is available, with a further breakdown into euro area/non-euro area assets and liabilities.

The collection system provides a single maturity breakdown for debt instruments: over one year (long-term) and up to one year (short-term). Only for domestic issues have separate codes been created for government and other issues.

In principle, income, commissions, charges and fees on portfolio transactions should be recorded separately in the collection system; where this is not the case, however, these items are included in the settlement amount for the portfolio transaction.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

In general terms, data on portfolio investment can be considered to be reliable, although there are some areas in which there is still some progress to be made.
As yet no offsetting entries are made for accrued interest.

Transactions in bonds between affiliated enterprises are recorded under portfolio investment and not under direct investment (see Sub-section 7.3).

Another deviation is the problem encountered when applying the valuation principle to the market value: the recorded value is the payment value. Nevertheless, this should be a good proxy for the market value.

8.4 GAPS
None.

8.5 INTENDED HARMONISATION
None.

8.6 ESTIMATION METHODS
Some estimates based on time series analysis are made for missing data and lead to some adjustments, if necessary.

The geographical allocation among non-euro area countries of portfolio investment assets is based on the geographical allocation of flows derived from detailed quarterly stocks, exchange rates and price indicators.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION
With regard to financial derivatives, Luxembourg has modified the nomenclature and codes for derivatives in order to distinguish between option-type derivatives and others (forward, interest and currency swaps, and futures). For the former, a supplementary breakdown has been introduced in order to produce a split between assets and liabilities according to the issuer.

The geographical counterpart is the counterpart in the transaction, because the counterpart is usually the market itself in the case of organised markets.

9.2 DEFINITIONS
The definitions used for the instruments are in line with the BPM5. Nevertheless, no distinction is made by type of margin; all are included in financial derivatives.

9.3 DEVIATIONS FROM AGREED DEFINITIONS
The Banque centrale du Luxembourg and STATEC comply with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payment and External Reserves Statistics and its predecessor.

All types of margins are included in financial derivatives.

9.4 GAPS
None.

9.5 INTENDED HARMONISATION
None.

9.6 ESTIMATION METHODS
None.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION
Information on the MFI sector is based on the assets and liabilities data of the banking sector (to be extended to non-bank MFIs), and on the general collection system for the other sectors.

Data on trade credits are covered by a quarterly survey, from which a sectoral breakdown can be obtained. The survey provides end-quarter
information on assets and liabilities related to transactions on goods and services for selected companies.

For the MFI sector, the flow data are derived from stock data (contained in their balance sheet reporting). There is an instrumental split between loans and deposits, and a sectoral breakdown is also available. The geographical breakdown can be provided, as well as a maturity split (based on the initial maturity of up to one year or more than one year). All these breakdowns are available for all periods (monthly, quarterly and annually).

The breakdown into extra-euro area and intra-euro area bop flows is derived from the geographical breakdown available in the balance sheets of the MFIs for both assets and liabilities.

Transactions settled via TARGET are registered by the intervening MFIs in the same way as other cross-border settlements. In the organisation of the reporting procedures, the Banque centrale du Luxembourg, as the operator of TARGET, is considered to be a second intervening MFI. As a result, interbank transactions are registered between the Banque centrale du Luxembourg and the domestic MFI that intervenes for the resident counterpart, using neutral codes.

10.2 DEFINITION

In general, the Banque centrale du Luxembourg and STATEC comply with the recommendations of the BPM5 and the harmonisation proposals made by the ECB’s Working Group on Balance of Payments and External Reserves Statistics and its predecessor.

Repo transactions are included in other investment, where they are recorded as loans. This instrument, which is used by the banking sector, is very important; most of these transactions are genuine repos, although sale and buy-back transactions also occur. By contrast, bond lending is not very well-developed. Trading in loan portfolios does take place, but is not yet very significant; it is treated as portfolio transactions.

Variations on short-term claims and liabilities between affiliated companies are classified under the direct investment component.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no significant deviations.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

Some estimates based on time series analysis are made for missing data and may lead to some adjustments, if necessary.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsection 3.2).

11.2 DEFINITION

The information is obtained from the Accounting Department of the Banque centrale du Luxembourg.

Financial derivatives are recorded on a net basis. Embedded financial derivatives are recorded together with the underlying financial instruments and are not recorded and valued separately.
All transactions in reserve assets are registered at market prices and converted into euro using the market exchange rates at the time of the transaction.

11.3 DEVIATIONS FROM AGREED DEFINITIONS
No significant deviations.

11.4 GAPS
None.

11.5 INTENDED HARMONISATION
None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION
Luxembourg produced its i.i.p. for the first time in 2003. The production of an i.i.p. within nine months implies that many data are of a provisional nature. With a view to including the results of stock data from ad hoc surveys, the period of nine months is too short, considering that it takes almost this long to collect the data; for direct investment stocks, for instance, a minimum of 12 months is needed to produce a first set of reliable data. A fully updated methodology and processing is under development, to become fully operational in 2005.

The following sources are used to compile the i.i.p. data:

(i) stocks:
- banking sector: portfolio investment (equities, long-term debt instruments and money market instruments) and other investment (short-term and long-term loans and deposits);
- general government: portfolio investment (government bonds) and other investment;
- monetary authorities (reserve assets and other assets);
- CIIs and insurance: portfolio investment (equities, long-term debt instruments and money market instruments) and other investment (short- and long-term loans and deposits);
- (ii) stocks of the previous year and yearly flows:
- banking sector and other sectors except SPEs: direct investment;
- (iii) flows and BIS stocks:
- other sectors except CIIs, insurance: all items.

Production of quarterly data will begin at the end of 2004. For other sectors, portfolio investment stocks will be used.

12.2 DEFINITIONS

12.2.1 GENERAL
The definitions for the i.i.p. items refer to the BPM5, as do the definitions for the respective b.o.p. items.

12.2.2 DIRECT INVESTMENT
The directional principle is applied partly. For SPEs, direct investment stocks are computed by accumulating past flows.

12.2.3 PORTFOLIO INVESTMENT
See Sub-section 12.2.1.

12.2.4 FINANCIAL DERIVATIVES
Financial derivatives will be computed on the basis of accumulated flows; therefore, no valuation of market prices will be carried out for the resulting stocks.

12.2.5 OTHER INVESTMENT
See Sub-section 12.2.1.
12.2.6 RESERVE ASSETS
Stocks of reserve assets will be compiled in cooperation with the Accounting Section of the Banque centrale du Luxembourg.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
See the b.o.p. financial account.

12.4 GAPS
See the b.o.p. financial account.

12.5 INTENDED HARMONISATION
See the b.o.p. financial account.

12.6 ESTIMATION METHODS
None.

4.15 HUNGARY

I ORGANISATION CHARTS
CHAPTER 4.15 HUNGARY

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

In Hungary, the central bank is responsible for the compilation and official publication of balance of payments (b.o.p.) statistics and the international investment position (i.i.p.). Data collection is based on the International Transaction Reporting System (ITRS), combined with statistical surveys and foreign trade statistics based on the Intrastat/Extrastat system for trade in goods. A major restructuring of the compilation system took place in the mid-1990s in order to meet the international methodological standards set out in the 5th edition of the IMF Balance of Payments Manual (BPM5), the data needs of economic policy formulation, the business community, academic circles and other users, as well as the reporting requirements set by international organisations, such as Eurostat, the International Monetary Fund (IMF) and the Organisation for Economic Co-operation and Development (OECD). The main stages of this process were the setting-up of the Statistics Department within Magyar Nemzeti Bank (MNB) as an independent organisational unit in 1994 and the launch of a new mainframe computerised system in 1997, forming the core of a five-year b.o.p. project designed to integrate the functions of the statistical process (data collection and processing with b.o.p. compilation and dissemination).

The following sections reflect the status of the compilation of b.o.p. and i.i.p. statistics in Hungary as at end-April 2004.

2.2 LEGISLATIVE PROVISIONS

The general legal background of b.o.p. and i.i.p. compilation consists of the Act on the Magyar Nemzeti Bank (Act LVIII of 2001), the Act on Statistics (Act XLVI of 1993) and related government decrees and orders of the President of the MNB. The reporting obligations of credit institutions, exchange offices and security custodians are specified in orders by the President of the MNB. The reporting obligation on accounts held at non-resident banks, on direct corporate loans, on foreign direct investment (FDI) of residents abroad and on FDI of non-residents in Hungary is prescribed in the annually revised Government Decree on the National Statistical Data Collection Programme.

In the case of non-compliance with compulsory reporting requirements, legal sanctions are imposed on reporting agents.

2.3 INTERNAL ORGANISATION

As a result of the restructuring of the Statistics Department in December 2002, the core function of the Balance of Payments (BOP) Division has been substantially changed. The field of responsibility has been narrowed and focuses mainly on methodological and publication issues. The remaining tasks relate to the compilation of b.o.p. and i.i.p. statistics and what had previously been carried out by the BOP Division (i.e. data collection and processing, formal checks and controls of data reports) was allocated to a newly created Data Reception and Preparation Division. This development is reflected in the decrease in the number of staff of the BOP Division. The BOP Division of the Statistics Department has 9 staff members, all of whom are professionals (holding university degrees or high-school diplomas). Four of the staff members have attended b.o.p. training courses offered by the IMF. One staff member holds a doctorate in economics and one staff member is taking part in a Ph.D. programme in economics. Members of the division are regularly invited to give lectures at different universities on topics such as the national accounts, the b.o.p. and the i.i.p.

There are no further sub-sections within the BOP Division but the division of labour in the field of the compilation of b.o.p. and i.i.p. statistics within the Statistics Department has been intensified.
The **Non-Financial Corporation Reports Section** of the newly established Data Reception and Preparation Division receives and compiles data from directly reporting enterprises on: (a) their cross-border accounts at non-resident banks and transactions affecting these accounts; (b) direct borrowing and lending; and (c) inward and outward direct investment. The **Credit Institution Reports Section** of the same division serves the BOP Division with respect to receiving and processing bank and exchange office reports. The **Data Preparation Section** is responsible for the compilation of data from different sources within an integrated statistical framework. There are built-in computerised logical and formal tests in data processing by all sections.

The **BOP Division** has retained the responsibility for methodological issues covering statistical and analytical (e.g. seasonal adjustment) fields of interest. B.o.p. statistical press releases are also drafted by this division. Statistical time series analysis to check the feasibility of data is applied on a regular basis and integrated into the compilation process. The Economics Department carries out economic analysis and prepares projections for external accounts. It is mainly the staff of this division that maintains contacts with the different users of BOP Division statistics. In addition, the BOP Division is responsible for updating the guidelines for bank reports, which contain a detailed description of data needs, statistical tables that banks are required to report and instructions for each reportable data entry. The same also applies to the non-financial corporations’ reporting guidelines.

### 2.4 EXTERNAL COOPERATION

The Act on Statistics (XLVI/1993) designates Magyar Nemzeti Bank as a body of the official statistical service, thereby providing the legal basis for inter-agency coordination. Magyar Nemzeti Bank has the overall responsibility for the compilation and publication of b.o.p. and i.i.p. statistics. At an operational level, all the source data are received and compiled by Magyar Nemzeti Bank, based on the reporting of (i) credit institutions, (ii) other financial and non-financial enterprises, (iii) the Hungarian State Treasury (MAK), (iv) the Government Debt Management Agency (ÁKK) and (v) the Hungarian Central Statistical Office (KSH).

Magyar Nemzeti Bank has undertaken joint initiatives with the KSH. In 1999, they launched annual and quarterly surveys on inward and outward direct investment and they are also cooperating to establish a new data collection system for international trade in services (paying special attention within this area to the travel item). As from 2003, trade in goods in the b.o.p. is compiled using the KSH’s foreign trade data (see Sub-section 4.1).

With regard to international relations, the MNB’s Statistics Department is represented at meetings of Eurostat’s Balance of Payments Working Party, and the Committee on Monetary, Financial and Balance of Payments Statistics (CMFB), as well as those of the OECD’s Working Party on Financial Statistics and of the Joint OECD-Eurostat “Trade-in-services statistics” experts. MNB staff participate regularly in ad hoc international statistical meetings and seminars, including those organised by the IMF and the European Central Bank (ECB). Hungary is a subscriber to the IMF’s Special Data Dissemination Standard (SDDS).

Between 1995 and 1998, the BOP Division received bilateral technical assistance from the Finnish, Austrian and Belgian central banks in its main fields of interests concerning the data collection system and the compilation process.

### 2.5 USERS

Magyar Nemzeti Bank disseminates b.o.p. and i.i.p. statistics through its website (www.mnb.hu) and updates them on a quarterly basis. International investors, government bodies, academic circles and the general public are among the users of the BOP Division’s statistics. In addition, this division reports
directly to international organisations such as Eurostat, the IMF, the OECD, the World Bank and the Bank for International Settlements (BIS). Other departments within Magyar Nemzeti Bank (e.g. the Economics Department, the Monetary Policy Department, etc.) use BOP Division data, notably in macroeconomic analysis and monetary policy formulation.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The primary data sources for Hungary’s b.o.p. statistics are the monthly reports of (i) Magyar Nemzeti Bank, (ii) credit institutions, (iii) enterprises on their direct borrowing from/ lending to non-residents, (iv) enterprises on their stocks of overall assets and liabilities vis-à-vis non-residents held outside the resident banking sector and on accumulated transactions and other changes affecting these positions, (v) exchange offices on their accumulated turnover and cash holdings, (vi) the ÁKK on the government sector’s foreign currency-denominated liabilities (vis-à-vis non-residents) and (v) the KSH on trade in goods (customs statistics).

Since 1998, credit institutions have separately reported all settlement transactions above a simplification threshold, set at USD 100,000 in 1998 and lowered to USD 50,000 in 1999. The threshold was reset in EUR instead of USD in 2004. Below this threshold, credit institutions report all their own and their clients’ transactions affecting their claims and liabilities vis-à-vis non-residents in aggregated form, broken down by currency, country and b.o.p. transaction type (under a closed system). On EU accession, an €12,500 simplification threshold was introduced for credit institutions. Transactions below this threshold are reported aggregatedly under a single transaction code by currency.

In the period 2000-03, enterprises had a monthly reporting requirement on their direct borrowing/lending activities for loans from/to non-residents of USD 500,000 or more; annual reporting was required for loans below this threshold. (Before 2000, each loan transaction and position had to be reported on a monthly basis, regardless of any threshold.) As for the direct external borrowing and lending, from 2004 a cut-off survey was launched, in which only selected enterprises have to report regularly.

Non-financial enterprises report on a monthly basis their stock of overall assets and liabilities held outside the resident banking sector vis-à-vis non-residents, as well as their accumulated transactions and other changes affecting these positions. Intra-group transactions and positions are also required to be reported.

Magyar Nemzeti Bank, together with the KSH, launched a joint set of four questionnaires in 1999, aimed at the statistical monitoring of the corporate sector’s direct investment transactions and positions. The quarterly questionnaires for transactions are used mainly to check the settlement data from the banking sector, to obtain more detailed figures for transactions (geographical and economic activity breakdowns) and to supplement settlement data with non-cash transactions. These quarterly questionnaires enable Magyar Nemzeti Bank to compile a breakdown by country and economic activity of equity capital investments for the period under review. The annual questionnaires are designed to obtain information on reinvested earnings and stock data. The first annual FDI survey was completed at the beginning of 2001. The results are carefully analysed and checked against other available sources (i.e. tax records). The data derived from the annual questionnaires (reinvested earnings and positions based on balance sheet information) were published in the b.o.p. and i.i.p. for the first time in March 2004. (Time series were accordingly revised back to 1995.)

As a supplementary source, reports by security traders and the Central Clearing House and

Depository (Budapest) Ltd. (KELER) are also used for compilation purposes.

3.2 REPORTING AGENTS

(i) Magyar Nemzeti Bank provides data on reserve assets, other claims and liabilities vis-à-vis non-residents and all its own transactions affecting its claims and liabilities vis-à-vis non-residents in aggregated form, broken down by currency, country and b.o.p. transaction type (under a closed system). In addition, the MNB’s report covers government transactions with non-residents, which are channelled through Magyar Nemzeti Bank.

(ii) The other monetary institutions sector is composed of commercial banks, special credit institutions, cooperative credit institutions and building societies. They submit monthly reports on their assets and liabilities vis-à-vis non-residents and on all their own and their clients’ transactions affecting their claims and liabilities vis-à-vis non-residents in aggregated form, broken down by currency, country and b.o.p. transaction type (under a closed system). Above a simplification threshold of €50,000, each transaction is reported separately (transaction-by-transaction reporting). From May 2004, transactions below a threshold of €12,500 are reported aggregately under a single transaction code by currency. All credit institutions conducting foreign exchange transactions or holding accounts in HUF for non-residents are obliged to meet the reporting requirements.

(iii) The general government sector comprises the central and local governments, extra-budgetary funds and social security funds. The State Holding and Privatisation Company (ÁPV Rt.) also belongs to this sector. The sector’s b.o.p. transactions are reported either indirectly by Magyar Nemzeti Bank or directly by the ÁKK for the transactions managed by institutions other than Magyar Nemzeti Bank.

(iv) Other sectors include non-financial corporations (corporations subject to the Act on Corporate Tax, except those with financial intermediation as their principal economic activity), other financial corporations (GIRO Ltd., KELER, insurance corporations and pension funds, and other financial intermediaries and auxiliaries), households and non-profit institutions serving households. Enterprises holding accounts at non-resident banks or participating in an intra-group settlement system fill out a structured b.o.p. and i.i.p. questionnaire, which is used for compilation of the monthly statistics. They submit the data in aggregated form, broken down by currency. Below a threshold of HUF 200 million of total annual current account (either credit or debit) transactions, details of current account transactions other than total credits and debits are not reported. For certain financial account items, the following supplementary sources are used: reports by enterprises directly borrowing from/lending to non-residents (other investment), reports by FDI companies and resident direct investors (direct investment), and reports by security traders and KELER (equity capital, equity securities, HUF-denominated government bonds).

3.3_THRESHOLDS

Since 1998, credit institutions have separately reported all settlement transactions above a simplification threshold, set at USD 100,000 in 1998 and lowered to USD 50,000 in 1999. The threshold was reset in EUR instead of USD in 2004. Below this threshold, credit institutions report all their own and their clients’ transactions affecting their claims and liabilities vis-à-vis non-residents in aggregated form, broken down by currency, country and b.o.p.
transaction type. On EU accession, an €12,500 simplification threshold was introduced for credit institutions. Transactions below this threshold are reported aggregately under a single transaction code by currency.

Before 2000, each loan transaction and position had to be reported on a monthly basis, regardless of any threshold. In 2000, enterprises started reporting their direct borrowing/lending activities for loans of USD 500,000 or more from/to non-residents on a monthly basis; annual reporting was required for loans below this threshold. In 2004, a cut-off survey, in which only selected enterprises have to report regularly, replaced the previous reporting scheme. The selection is made on the basis of combined criteria considering the positions and total transactions.

Enterprises holding accounts with non-resident banks, or participating in an inter-company settlement system, submit their reports in an aggregated b.o.p.-structured form, broken down by currency. Below a threshold of HUF 200 million of total annual current account (either credit or debit) transactions, details of current account transactions other than total credits and debits are not reported.

<td>B.o.p.</td>
<td>Monthly</td>
<td>Monthly: 30 working days, quarterly: three months</td>
<td>On EU accession, the system for the publication and revision of b.o.p. data changed. At a monthly frequency, only the main aggregates are compiled according to the ECB’s monthly requirements, in HUF. Based on past experience, maintaining the practice of releasing settlements-based data at a monthly frequency and accruals data on a quarterly basis would be a source of confusion for users, and it would not allow for a consistent economic interpretation of b.o.p. statistics. For this reason, from July 2004 Magyar Nemzeti Bank ceased to release monthly b.o.p. data for the general public. Standard BPM5 components, in HUF and EUR, are disseminated quarterly. Data are available but not published by currency; a geographical breakdown is available, but not published regularly, except for FDI equity flows, upon request, both the currency and country breakdowns may be obtained.</td>

3.4 AVAILABILITY OF DATA

| Table 2 The compilation of monthly balance of payments estimates |
3.5 DATA CONTROLS

The b.o.p. project launched in 1997 sought to improve data management procedures through the development of computerised edit checks to identify coding and other errors in source data and to minimise processing errors in editing and coding. Formal computerised checks of individual reports are built into the compilation process.

The reporting formats, where feasible, allow for the verification of classification. Internal data processing checks are built into the ITRS to minimise classification errors. All the consistency requirements within one report and between different reports of a single reporting entity are clearly identified in the instructions attached to each reporting form. High-value transactions are routinely checked with respondents.

If possible, there are formal cross-checks between different reports of different reporting agents. For example: (i) a credit institution’s report on a cross-border transfer between its customer’s domestic and non-resident accounts is checked against the customer’s report on its bank account held outside the resident banking sector; (ii) monthly reports of security traders, KELER and other custodians are also used for b.o.p. validation purposes: the changes in monthly closing-day positions for each security are used to check the credit institutions’ transaction reports (in the b.o.p., liabilities in equity and HUF-denominated government and central bank securities are computed according to the monthly changes in security holdings); (iii) results of the quarterly FDI enterprise surveys are used to control settlement data from the banking sector and to obtain a detailed classification of transactions (e.g. geographical and economic activity breakdowns); (iv) loan transactions reported directly by enterprises are checked against the relevant transactions reported by the credit institutions; and (v) foreign currency cash transactions reported by exchange offices are checked against the data reported by banks.

Plausibility checks are also carried out on both individual reports and aggregate levels. At both these levels, time series analysis is an essential tool for this purpose. Consistency checks with other statistics are also carried out at an aggregate level. Should there be any inconsistency at this level, there is a feedback to the individual report level and the reporting entity is asked to clarify the reason for the inconsistency.

Staff closely monitor the scale of errors and omissions and seek to minimise them by carrying out cross-checks between current, capital and financial accounts. The behaviour of the b.o.p. statistical time series is routinely assessed against related series, e.g. financial flow data are validated with the corresponding stock of external debt data, and reported data on investment income are assessed in relation to the corresponding stock in the i.i.p. statistics. Information reported in the financial press is used to verify high-value FDI and other transactions.

3.6 REVISION POLICY

Due to the change affecting the compilation of the statistical data on trade in goods (that is, the shift from customs-based statistics to the Intrastat/Extrastat system), from May 2004 on a monthly basis Magyar Nemzeti Bank will only be able to compile the settlements-based b.o.p. within 30 working days of the end of the reference period, in accordance with the practice followed prior to 2002. Accruals-based b.o.p. data can only be compiled and released on a quarterly basis. Based on past experience, maintaining the practice of releasing settlements-based data at a monthly frequency and accruals data on a quarterly basis would be a source of confusion for users, and it would not allow for a consistent economic interpretation of b.o.p. statistics. For this reason, from July 2004 Magyar Nemzeti Bank ceased to release monthly b.o.p. data for the general public.
Detailed b.o.p. and i.i.p. statistics will only be published quarterly, with a deadline of reference quarter + 3 months, in accordance with the current practice and international data reporting requirements.

- In accordance with the data revision practice of the Intrastat system, b.o.p. data for the previous two quarters will be revised at the time of release of the data for the reference quarter. Yearly b.o.p. data will be first released nine months after the reference year (in contrast with the current three months). They will include final data for trade in goods and services, as well as preliminary data for reinvested earnings. (This will replace the current practice of publishing preliminary data for reinvested earnings 15 months after the reference year.) However, yearly b.o.p. data will be first revised – but will not be the subject of a separate press release on the annual b.o.p. – 15 months after the reference year when detailed statistics for direct investment (in a geographical and industry breakdown) will be published. As in the new publication method Magyar Nemzeti Bank does not release yearly b.o.p. data three months after the reference year, the release of data 15 months after the reference year would only serve the purpose of publishing detailed direct investment statistics. Nevertheless, although a separate b.o.p. press release will not be issued at that date, the annual b.o.p. time series will be adjusted on the internet accordingly. The b.o.p., including final data for reinvested earnings and the stock of direct investment, will be released 21 months after the reference year (currently 27 months).

The status of the data (i.e. first release, first revision, second revision and final) is notified in the press release attached to the data dissemination. The actual time series and the methodological notes are posted on the MNB’s website.

3.7 DISSEMINATION

To meet the SDDS requirement, an advance release calendar giving the precise release dates for the next 12 months is posted on the IMF’s website. The calendar is updated twice a year, in June and December. An advance release calendar is disseminated through the MNB’s website as well, indicating the release dates for the upcoming 6 months.

Statistics are released simultaneously to all interested parties via the press releases “Hungary’s balance of payments” in Hungarian and English; detailed tables are posted at the same time on the MNB’s website, and the components prescribed in the SDDS are disseminated on Hungary’s National Summary Data page on the day of release. Unpublished, non-confidential, sub-aggregated data are made available upon request.

Detailed documentation on the concepts, scope, classifications, basis of recording, data sources and deviations from internationally accepted standards are disseminated, in Hungarian and English, through the MNB’s website. Publications such as the IMF’s Balance of Payments Statistics Yearbook and the KSH’s Annual Statistical Yearbook also contain metadata identifying deviations from internationally accepted standards.

Detailed information on all components of the b.o.p. (current, capital and financial accounts) is available on the MNB’s website in time series format (in English and Hungarian).

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

At the time of the publication of 2002 annual b.o.p. statistics in February 2003, the settlement data for goods were replaced by the KSH’s foreign trade data. The b.o.p. time series were revised back to 1995 and, as from 2003, the trade in goods item is compiled using this

EU and accession countries’ balance of payments statistical methods
November 2004

ECB
source. From May 2004, the Intrastat/Extrastat system replaces customs statistics.

4.2 DEFINITION

Using foreign trade data as a source of information, exports and imports are recorded on an f.o.b. basis; a geographical and the standard category breakdown of goods are available.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

None.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

As for the monthly b.o.p., services are recorded when the settlement transactions appear in the reporting system of credit institutions or enterprises. In addition, monthly reports by exchange offices are also used for the compilation of the travel item.

5.2 DEFINITION

Eleven separate sub-items are published under the services heading:

(i) transportation services;
(ii) travel;
(iii) communication services;
(iv) construction services;
(v) insurance services;
(vi) financial services;
(vii) computer and information services;
(viii) royalties and licence fees;
(ix) other business services;
(x) personal, cultural and recreational services;
(xi) government services.

Rental fees for real estate paid by legal person tenants are recorded as other business services, while such fees paid by natural person tenants are recorded as travel.

Rental fees paid by resident tenants to non-resident owners of real estate in Hungary and the rental fees paid by non-resident tenants to resident owners of real estate abroad are recorded under direct investment income.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

Insurance services are valued on the basis of total premiums (rather than service charges included in total premiums earned).

5.4 GAPS

None.

5.5 INTENDED HARMONISATION

Surveys on inbound and outbound tourism were launched in July 2003. To observe other services (except transport, insurance, financial and government services), a new quarterly survey, managed by the KSH, started in the third quarter of 2003. The data deriving from this new source are intended to be incorporated into the b.o.p. from the first quarter of 2005. Regarding the other services (transport, insurance, financial and government services), the development of the data collection system will be finalised in 2004.

5.6 ESTIMATION METHODS

Cash transactions affecting households’ foreign exchange accounts held at resident banks are
used as a proxy to capture cross-border cash transactions without banking intermediation and are partly included as travel.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

This is part of the general reporting system. From 2004, investment income is recorded on an accruals basis in the quarterly b.o.p., while the monthly statistics are still compiled on a cash basis. Also from 2004, reinvested earnings are included in the b.o.p. and time series are accordingly revised back to 1995.

Since 1999, in line with the 1997 change in b.o.p. methodology, interest payments related to interest rate swaps and currency swaps have been recorded as financial derivatives in the financial account, instead of as income in the current account.

A sector, currency and country breakdown is available for each type of investment income. Income on international reserves is reported by Magyar Nemzeti Bank and recorded under the underlying type of instrument.

6.1.1 COMPENSATION OF EMPLOYEES

Part of the general reporting system.

6.1.2 INCOME ON DIRECT INVESTMENT

Part of the general reporting system. No special source of information is used. In line with the BPM5, any participation greater than or equal to 10% in a corporation’s equity capital is classified as a direct investment. Contributions in kind and reinvested earnings are included in the b.o.p.

Since 1996, direct investment includes not only equity investment, but also other non-equity capital transactions (such as inter-company capital transactions). There is a single item for each type of recorded direct investment income, i.e. income on equity (dividends and distributed income, reinvested earnings) and income on inter-company capital. Reporting agents use separate transaction codes for each income category.

6.1.3 INCOME ON PORTFOLIO INVESTMENT

Part of the general reporting system. No special source of information is used. Each recorded income transaction has a specific code in the bank reports and a separate heading in the direct company reports. Income on equity, income on bonds and notes and income on money market instruments are recorded separately. Since 1999, in line with the change in b.o.p. methodology, interest payments related to interest rate swaps and currency swaps have been recorded as financial derivatives in the financial account, instead of as income in the current account. Income is recorded according to the accruals principle in the quarterly b.o.p.

6.1.4 INCOME ON OTHER INVESTMENT

Income on other investment is captured by the general reporting system and is supplemented by the direct enterprise reports on direct borrowing from/lending to non-residents. Each recorded income transaction has a specific code in the bank reports and a separate heading in the direct company reports. Income on short-term and long-term other investment is broken down by type of instrument (e.g. deposits, loans, etc.). Income is recorded according to the accruals principle in the quarterly b.o.p.

6.2 DEVIATIONS FROM AGREED DEFINITIONS

Direct investment income is compiled according to the all-inclusive concept instead of the current operating performance concept.

6.3 GAPS

None.

6.4 INTENDED HARMONISATION

None.
6.5 ESTIMATION METHODS

Cash transactions affecting households’ foreign exchange accounts held at resident banks are used as a proxy to capture cross-border cash transactions without banking intermediation and are partly included as compensation of employees. Reinvested earnings and dividends declared payable are calculated as an average proportion of GDP for the previous three years until the reported values deriving from the annual FDI questionnaires become available. In calculating the absolute amounts, Magyar Nemzeti Bank’s official GDP forecast serves as a basis. The quarterly data are produced from the annual data, using the seasonal factors of GDP. The Accruals for income on other investment of non-financial enterprises are estimated on the basis of historical settlements data.

7 CURRENT TRANSFERS

Data for current transfers are compiled on the basis of the general reporting system outlined in the previous sections. As a supplementary source, MÁK reports cash transfers received on a monthly basis.

In principle, the definition of current transfers is in line with the BPM5. The use of different transaction codes in the bank reports and a separate line in the direct enterprise reports enables a distinction to be made between current and capital transfers. Net capital transfers are published separately for the government sector and for other sectors.

The category acquisition/disposal of non-produced non-financial assets emerged as a result of the split of property income in the BPM4 current account into the use and sale of intangible assets. Transactions related to the sale of intangible assets are recorded in the capital account. This item is published in net terms with no sector breakdown.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

As part of the standard classification of the b.o.p. harmonised with the revised System of National Accounts (SNA 93), the capital account in its recent form has been presented in BPM5 format since 1995. The capital account for 1995 is estimated.

Data for capital transfers and non-produced non-financial assets are compiled on the basis of the general reporting system outlined in the previous sections. As a supplementary source, MÁK reports cash transfers received on a monthly basis.

8.2 DEFINITION

In principle, the definition of capital transfers is in line with the BPM5. The use of different transaction codes in the bank reports and a separate line in the direct enterprise reports enables a distinction to be made between current and capital transfers.

Cash transactions affecting households’ foreign exchange accounts held at resident banks are used as a proxy to capture cross-border cash transactions without banking intermediation and are partly included as current transfers.

Since a significant amount of transfers are received from European Union (EU) institutions, the use of the Eurostat figures might be considered as an important supplementary source of information for validating the split between current and capital transfers.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Transactions without banking mediation and not directly reported by reporting agents are excluded.
8.5 INTENDED HARMONISATION

Since a significant amount of transfers are received from the EU institutions, the use of Eurostat figures might be considered as an important supplementary source of information for validating the split between current and capital transfers.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

As direct investment is covered by the general reporting system, no special source of information is used. Direct investment data mainly reflect cash contributions and contributions in kind from foreign trade statistics. Data for inter-company loans are checked and supplemented by the information from direct enterprise reports.

Subordinated loans of credit institutions received from their own direct investor have been classified as inter-company loans since 1999. Before 1999, this item was recorded under equity capital.

Breakdowns by sector (according to the debtor principle), instrument, country (according to the transactor principle) and industry are available for each component. The last two are based on the quarterly survey launched in 1999 (see Sub-section 3.1, paragraph 4).

9.2 DEFINITION

In accordance with the BPM5, any participation greater than or equal to 10% in a corporation’s equity capital is classified as a direct investment. Since 1996, direct investment not only includes equity investment, but also other non-equity capital transactions, such as inter-company loans. Real estate investments by natural persons are also classified under this heading.

As opposed to other types of investment recorded in the financial account, direct investment is primarily recorded on a directional basis, instead of under an asset/liability arrangement. Thus, direct investment in Hungary and direct investment abroad are the two major sub-groups within the main heading.

Equity cross-participation is recorded under direct investment from 2004. Before 2004, if an affiliated company had acquired a claim on equity in its direct investor, the transaction was recorded either under portfolio investment (if less than 10% of the equity capital) or as a separate direct investment transaction (if greater than or equal to 10%).

9.3 DEVIATIONS FROM AGREED DEFINITIONS

Instead of a fully consolidated system, only direct ownership relationships are classified as direct investment, except for financial transactions between non-financial corporations and affiliated financial SPEs (special-purpose entities), which are recorded as FDI under other capital in line with the international standards from 2002. (Before 2002, these transactions were treated as other investment.)

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

There is a joint project with the KSH on issues related to the fully consolidated system.

9.6 ESTIMATION METHODS

Cash transactions affecting households’ foreign exchange accounts held at resident banks are used as a proxy to capture cross-border cash transactions without banking intermediation and are partly included as direct investment (estimated transactions in real estate).
10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Portfolio investment is covered by the general reporting system and is supplemented by monthly reports from security traders, KELER and other custodians, which are used for b.o.p. validation and compilation purposes. In the b.o.p., liabilities in equity and HUF-denominated government and central bank securities are computed according to the monthly changes in security holdings. However, the changes in monthly closing-day positions for each security are used to check the credit institutions’ security transaction reports. Transactions in financial assets traded or tradable in organised or other financial markets (e.g. equity and debt securities, and financial derivatives) are recorded under this heading. Portfolio investment has been published as a separate item since 1996.

Except for HUF-denominated government securities and central bank securities, data for other categories are compiled as credit institutions and enterprises report the relevant information. As for HUF-denominated government and central bank securities, transaction data are derived from changes in stocks at nominal value, net of other volume changes. Although between January 2000 and February 2003 transactions in equity securities recorded in the financial account as liabilities were also derived from changes in stocks security by security at market prices net of valuation and other volume changes, for technical reasons since February 2003 data have again been compiled as credit institutions and enterprises report the relevant information.

A transaction is recorded as a change in assets under financial derivatives in the following cases: premiums paid on purchased options (put or call), trading in derivative positions, transactions related to derivative positions having a positive net present value at the time of transaction, and closing derivative positions with net gains.

A transaction is recorded as a change in liabilities under financial derivatives in the following cases: premiums received on written options (put or call), transactions related to derivative positions having a negative net present value at the time of transaction, and closing derivative positions with a net loss.

Since 1999, in line with the change in b.o.p. methodology, interest payments related to interest rate swaps and currency swaps have been recorded under financial derivatives in the financial account, instead of as income in the current account.

Breakdowns by sector (according to the debtor principle), instrument, country (according to the transactor principle) and currency are available for each data category, except for those where transaction is calculated from a change in position (HUF-denominated government securities, central bank securities and equities).

10.2 DEFINITION

The following portfolio investment sub-items are published separately according to the asset/liability principle:

(i) equity securities (<10%);
(ii) bonds and notes;
(iii) money market instruments; and
(iv) financial derivatives.

Since 2000, repurchase agreements (repos) have been treated as collateralised loans in accordance with the BPM5.
10.3 DEVIATIONS FROM AGREED DEFINITIONS

Financial derivatives are classified as a separate sub-item under portfolio investment. Financial derivatives of Magyar Nemzeti Bank are intentionally classified under portfolio investment instead of reserve assets.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

The use of a security-by-security database is planned. Furthermore, the preparation of an instrument breakdown for derivatives is foreseen.

10.6 ESTIMATION METHODS

As for HUF-denominated government and central bank securities, transaction data are derived from changes in stocks at nominal value, net of other volume changes.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Financial derivatives are classified as a separate sub-item under portfolio investment (see Section 10).

11.2 DEFINITIONS

See Sub-section 11.1.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 11.1.

11.4 GAPS

See Sub-section 11.1.

11.5 INTENDED HARMONISATION

See Sub-section 11.1.

11.6 ESTIMATION METHODS

See Sub-section 11.1.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Other investment is covered by the general reporting system and is supplemented by the direct enterprise reports on direct borrowing from/lending to non-residents. Transactions in financial instruments not included under direct investment and portfolio investment, such as syndicated loans, interbank loans and trade credits, are recorded under this heading, broken down by original maturity (short-term is classified as up to one year and long-term as over one year).

As far as assets and liabilities of non-financial enterprises are concerned, from 2004 a cut-off survey (the cut-off being a function of the value of end-year outstanding stocks or gross annual transactions has replaced the monthly and annual reporting obligations. There has been no change in the frequency of the reporting obligation for loans guaranteed by the Government, for which a monthly report is prescribed. Unlike in the past, since 2000 settlement data checked against direct reports and supplemented by non-cash transactions have been published in the statistics.

Up to the end of 1999, the statistical treatment of loan transactions reported late by enterprises depended on whether the transaction took place in the same calendar year or even before. In the former case, the transaction reported late was recorded in the financial account of the month of the report. In the latter case, other volume changes in the i.i.p., but no financial account transaction, were recorded for this item. At the end of 1999, the time series for these late-
reported transactions according to the original (or, failing this, the estimated) timing were revised retrospectively, back to 1996. Since 2000, this correction has become regular, revising the flow and stock data at year-end, retrospectively.

Transactions affecting cash in foreign exchange, sight deposits and current accounts of banks are derived as changes in stocks, net of valuation and other volume changes. The same applies for such transactions by the enterprise sector.

Breakdowns by sector (according to the resident counterparty), instrument, maturity, country and currency are available for each data category, except for transactions of non-financial enterprises channelled outside of the resident banking sector.

As for trade credits, within the framework of the incorporation of foreign trade statistics, from 2003 (and adjusting the data back to 1995) the difference between transactions in goods as recorded in foreign trade statistics (excluding contributions in kind and corrected using additional information received from the KSH on goods for processing and by adding net repairs) and net settlements data (corrected with reported fees for processing and repairs as well as goods procured in ports by carriers) is offset by means of corresponding entries under other short-term claims/liabilities of the financial account. This means that the difference between payments and the balance of exports and imports recorded in the course of the physical movements of goods is financed by economic agents through trade credit.

12.2 DEFINITION

In principle, the definitions for other investment transactions are in line with the BPM5.

Up to the end of 1999, repos were recorded as transactions in underlying securities under portfolio investment (or change in international reserves). Since 2000, repos have been treated as collateralised loans and recorded under other investment (or change in international reserves).

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

The difference between payments and the balance of exports and imports recorded in the course of the physical movements of goods in foreign trade statistics is supposed to be financed by economic agents through trade credit and recorded under other short-term claims/liabilities.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

Gross international reserves are external assets of the monetary authority that are readily available for directly financing payments imbalances, for indirectly regulating the magnitude of payments imbalances through intervention in foreign exchange markets to affect the HUF exchange rate, and/or for other purposes. The change in international reserves is computed as the change in the stock of comprising instruments, net of valuation and other volume changes.

Instrument and currency breakdowns of reserve assets are available, although the latter breakdown is confidential.
13.2 DEFINITION

The definition of international reserves is in line with the BPM5. These reserve assets are under the effective control of the monetary authority. They refer only to:

- highly liquid, marketable and creditworthy foreign currency-denominated claims (consisting of currency, deposits and securities) on non-residents; positions vis-à-vis residents and positions in local currency are excluded;
- monetary gold;
- special drawing rights (SDRs); and
- the reserve position in the Fund (RPF).

Reserve assets are compiled in accordance with the gross concept (i.e. no netting with monetary authorities’ liabilities).

13.3 DEVIATIONS FROM AGREED DEFINITIONS

Financial derivatives are intentionally excluded from international reserves.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

Accounting for accruals on reserve assets is planned.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

As from 2003, the i.i.p. is compiled and published on a quarterly basis, except in the case of the international reserves, where the monthly periodicity is observed. The full sequence of data on opening positions, transactions, exchange rate changes, price changes, other volume changes and closing positions is compiled and published in HUF in hard copy for all standard components of the BPM5:

(i) international reserves;
(ii) direct investment (equity capital and reinvested earnings, other capital);
(iii) portfolio investment (equity securities, bonds and notes, money market instruments, financial derivatives); and
(iv) other investment, broken down by original maturity.

Assets and liabilities are compiled separately.

Stocks of external assets and liabilities are disseminated in time series format in HUF and EUR through the MNB’s website. External debt data are integrated into the i.i.p. framework (total liabilities less liabilities in equity).

Breakdowns by sector (according to the resident counterparty) and currency are available for all types of investment. Coverage and concepts are in line with the definitions used in the financial account.

A maturity breakdown of long-term debt instruments by sector (according to the debtor principle), which does not include the non-guaranteed debt component of non-financial enterprises and other sectors, is compiled and published quarterly.

14.1.2 DIRECT INVESTMENT

The stock of resident direct investment abroad has been published since 1993. Since 2004, apart from when recognising reinvested earnings, direct data provision by companies has allowed for the replacement of end-year stock data, calculated by cumulating flow data, with stock data reported by enterprises for the period starting from 1998. Quarterly positions and the pre-1998 data have remained calculated using the perpetual inventory method. The stock of assets in the form of other FDI capital transactions is derived from accumulated flows.
Since 1999, the subordinated loans of credit institutions extended to their own affiliates have been classified as inter-company loans. Before 1999, this item was recorded under equity capital.

The stock of non-resident direct investment in Hungary has been published since 1990. Since 2004, apart from when recognising reinvested earnings, direct data provision by companies has allowed for the replacement of end-year stock data, calculated by cumulating flow data, with stock data reported by enterprises for the period starting from 1998. Quarterly positions have continued to be compiled using the perpetual inventory method. Since 1996, the stock of liabilities in the form of inter-company loans has been directly reported by enterprises.

On the assets side, subordinated loans of credit institutions received from their own direct investor have, since 1999, been classified as inter-company loans. Before 1999, this item was recorded under equity capital.

An annual survey of inward and outward direct investment provides information on the stock of equity capital at book value (quoted enterprise equity is revalued at market prices), reinvested earnings and a geographical breakdown (see Sub-section 3.1, paragraph 4).

Stock data for inward and outward direct investment, broken down into equity capital and other capital, are compiled on a sectoral basis and published at a quarterly frequency with a timeliness of three months.

14.1.3 PORTFOLIO INVESTMENT

With regard to portfolio assets, Magyar Nemzeti Bank and credit institutions submit reports on their portfolio transactions and stocks. Concerning the other sectors, given the lack of reports on stock data, positions are derived from accumulated flows. In these reports, the currency in which the transaction is reported is linked to the denomination of the settlement, rather than to the actual denomination of the securities. Stocks computed from flows in euro area legacy currencies have been recorded in € since January 1999.

The assets of Magyar Nemzeti Bank and credit institutions in the form of debt securities are valued at historic cost. For the other sectors, stocks are recorded as accumulated flows at the actual transaction price.

Magyar Nemzeti Bank and credit institutions have been reporting stock data for financial derivative positions at market (replacement) value since 1999. By contrast with transactions, there is no information on the derivative positions of enterprises and other sectors. Derivative positions are published in aggregated form with no breakdown.

As regards portfolio liabilities, Magyar Nemzeti Bank and credit institutions submit reports not only on transactions, but also on their own and the government sector’s portfolio stocks, except for equity securities.

As for the other sectors, owing to a lack of reported portfolio equity stock data, positions are derived from accumulated flows, aggregated and recorded in HUF. The figure is revalued on the basis of the change in the index of the Budapest Stock Exchange (BUX) at the end of each month.

Liabilities of Magyar Nemzeti Bank, credit institutions and the government sector in the form of debt securities are recorded at face value. For the other sectors, stocks are recorded as accumulated flows at actual transaction price. The outstanding stock of foreign exchange-denominated bonds held by residents is subtracted from the stock issued by residents abroad.

Magyar Nemzeti Bank and credit institutions have been reporting the stock of financial derivative positions at market (replacement) value since 1999. In contrast to transactions, there is no information on derivative positions
of enterprises and other sectors. Derivative positions are published in aggregated form with no breakdown.

As from 2003, stock data for assets and liabilities under portfolio investment, broken down by instrument, sector and currency, are compiled and published at a quarterly frequency with a timeliness of three months.

14.1.4 FINANCIAL DERIVATIVES
Financial derivatives are classified under portfolio investment (see Sub-section 14.1.3).

14.1.5 OTHER INVESTMENT
The stock of claims of residents on non-residents is broken down by original maturity. All sectors, except households, report stock data for the statistics.

The stock of claims of non-residents on residents is broken down by original maturity. All sectors, except households, report stock data for the statistics.

As from 2003, stock data for assets and liabilities under other investment, broken down by original maturity, sector and currency, are compiled and published at a quarterly frequency with a timeliness of three months.

14.1.6 RESERVE ASSETS
In accordance with international standards, reserve assets comprise:

(i) monetary gold;
(ii) liquid foreign exchange assets (cash, current accounts, sight deposits, securities, etc.);
(iii) SDRs; and
(iv) the RPF.

Data are obtained from the MNB’s balance sheet.

Gold is valued at London fixing prices. Since 2000, securities have been valued at market prices, net of accrued interest. Up to 1999, securities were valued at historic cost.

The stock of reserve assets is published on a monthly basis with a one-week lag for the preliminary data and a lag of 30 working days for the final data. Instrument and currency breakdowns of reserve assets are available, although the latter breakdown is confidential.

14.2 DEVIATIONS FROM AGREED DEFINITIONS
Financial derivatives are intentionally excluded from international reserves.

14.3 GAPS
Liabilities are valued at nominal value and assets (other than reserves) are at historic cost.

14.4 INTENDED HARMONISATION
None.

14.5 ESTIMATION METHODS
None.

15 CONTACTS
This country information was drafted by Hungary and agreed with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Hungary should be addressed to:

CHAPTER 4.16

MALTA

1 ORGANISATION CHART
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The preparation and presentation of the balance of payments (b.o.p.) statement of Malta has been the responsibility of the National Statistical Office (NSO) since 1954, the year that such data started to be published by the statistical authorities in Malta. Since 1993, the compilation process has been enhanced by the participation of the Central Bank of Malta (CBM). The Central Bank of Malta, through its Balance of Payments Section, cooperates actively with the NSO in the collection, vetting and compilation of b.o.p. data throughout the year. The b.o.p. statement is compiled on a transaction basis. Both the current and the capital and financial accounts are published quarterly and annually.

In July 2003 a cooperation agreement was signed between the Central Bank of Malta and the NSO on the collection and compilation of b.o.p./i.i.p. data. Under the agreement, the NSO became responsible for collecting data from reporting agents in the non-financial sectors of the economy as specified in the European System of Accounts 1995. The Central Bank of Malta, on the other hand, became responsible for the collection of data from reporting agents in the financial sector. This will be done with the necessary cooperation of the Malta Financial Services Authority (MFSA) and the Malta Stock Exchange.

The Central Bank of Malta has an additional role in the b.o.p. compilation process. It collects data on cash-based transactions between residents and non-residents, as recorded by local banks, on a monthly basis.

The Central Bank of Malta and the NSO have shared competency in the compilation of the international investment position (i.i.p.). In 1999, the Central Bank of Malta and the NSO undertook to align b.o.p. and related data with international standards. By March 2000, data covering the years 1995 to 1999 were revised and reclassified in accordance with the 5th edition of the IMF Balance of Payments Manual (BPM5).

The NSO together with the Central Bank of Malta have developed a framework for a direct reporting data collection system (DR), which will be based on statistical surveys. The system will be used for compiling both monthly and quarterly b.o.p. and i.i.p. statistics.

2.2 LEGISLATIVE PROVISIONS

The Malta Statistics Authority Act (Act XXIV of 2000) provides for the establishment of an Authority to regulate functions regarding resources relating to the collection, compilation and publication of official statistics. The legislation also regulates the NSO and establishes its functions, which include the collection, compilation, extraction and release of official statistics. The Director General who heads the NSO is also an ex officio member of the Board of the Authority. He carries out the day-to-day operations of the office within the Authority in accordance with the general lines of policy established by the Authority (Section 9).

One of the main functions of the Authority is to regulate and generally supervise the production of official statistics in accordance with international requirements and standards (Section 7 (b)).

The First Schedule to the Act covers matters, including the b.o.p., in respect of which statistics may be collected, prepared and published. Section 43 of the Act outlines the administrative penalties. A person is liable to pay a penalty of MTL 50 (€127) for every month that elapses from the end of the deadline for the provision of requested information (Section 43-1 (a)). A person is liable to pay a penalty of MTL 100 (€254) if that person fails or refuses to provide information.

1 Opening middle €/MTL exchange rate on 31 May 2001: MTL 2.5369.
requested by the Director General (Section 43-1 (b)).

The new Central Bank of Malta Act of 2002 empowers the Central Bank of Malta to collect statistical information from persons. In fact, Section 24A (3) (g) allows the bank to collect b.o.p./i.i.p. data from any “person who holds external assets and liabilities or carries out cross border transactions which the Bank determines are relevant to compile b.o.p. statistics or to establish the balance of the stock of external financial assets and liabilities for Malta, otherwise referred to as the International Investment Position.” The Central Bank of Malta may, through the adoption of appropriate directives, provide for administrative penalties.

2.3 INTERNAL ORGANISATION

The BOP Section of the NSO is responsible for the collection, checking and processing of data relating to the non-financial sector and the overall consolidation and dissemination of b.o.p. and i.i.p. statements. A similar section at the Central Bank of Malta collects data from the financial sector and actively participates in the overall compilation and vetting process. There are ten staff members working in these units, six at the NSO and four at the Central Bank of Malta.

An analysis of the quarterly b.o.p. is given in the NSO News Release, which is published less than three months after the reporting period. Furthermore, an analysis of b.o.p. data is carried out by the Economic Analysis Office of the Economic Research Department of the Central Bank of Malta. This analysis is published in the CBM’s Quarterly Review and Annual Report. Annual data are also analysed and published by the Central Bank of Malta and the Economic Policy Division of the Ministry of Finance.

2.4 EXTERNAL COOPERATION

At the NSO, the BOP Section works closely with the National Accounts Section, particularly where GDP and GNP issues are concerned. As regards merchandise trade data, these are received by the Trade Section of the NSO and passed on to the BOP Section of the NSO every month. The BOP Section of the Central Bank of Malta in turn provides information about travel earnings and expenditure to the Travel Section of the NSO, as the latter is responsible for compiling tourism statistics. In addition, the BOP Section of the NSO receives data in line with specific requests made to the Ministry of Finance and the Treasury Department. These data cover debt servicing, the acquisition of immovable property in Malta by non-residents and capital grants.

The BOP sections of the NSO and the Central Bank of Malta have been in close contact with a b.o.p. expert from the De Nederlandsche Bank in connection with the development of a direct reporting data collection system. The sections have also been working closely with Eurostat on electronic data interchange (EDI) requirements and with the European Central Bank (ECB) on new developments in the area of b.o.p./i.i.p. statistics. Technical missions from the International Monetary Fund (IMF) have also advised the Maltese statistical authorities on b.o.p. issues in recent years. The NSO sends b.o.p. and i.i.p. data to the IMF and Eurostat on a regular basis. Moreover, the Central Bank of Malta’s BOP Office also sends quarterly b.o.p. and annual i.i.p. data to the ECB.

2.5 USERS

The main user within the NSO of b.o.p. and related statistics, where data on exports and imports of goods and services as well as investment income are concerned, is the National Accounts Section. Other internal users include the Travel Section of the NSO with regard to travel earnings and expenditure. The Economic Research Department of the Central Bank of Malta also uses b.o.p. and related statistics for economic analysis.
The external user of b.o.p. and related statistics at the government level is the Economic Policy Division of the Ministry of Finance. Outside the public sector, there are several organisations and enterprises in tourism, industry and the financial sector which frequently make use of such data. International organisations also using these data include the IMF, Eurostat, the ECB, the Organisation for Economic Co-operation and Development (OECD) and the United Nations. Other external users are credit rating agencies and financial institutions.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The type of data collection system used to compile b.o.p. statistics is a mixed system based on direct reporting, a partial settlements system and other data sources. The partial settlements system captures cash-based transactions between residents and non-residents that pass through the local banking system.

Another important element of the collection system is the monthly survey sent to reporting agents of both the non-financial and financial sectors. The top companies operating in the non-financial sector of the national economy are surveyed on a monthly basis and an annual survey is sent to an even larger number of companies. This survey is based on a stock/flow/income model and covers all the financial instruments and related income as well as the services transactions of these enterprises.

The financial sector is also now being surveyed. A monthly census is conducted for credit and financial institutions, domestic insurance companies and bureaux de change. The main insurance agents are surveyed on a monthly basis and the rest annually. The main collective investment schemes (CIS) will be surveyed on a quarterly basis and the rest annually. A monthly net asset value of each CIS will be forwarded to the Central Bank of Malta by the MFSA in order to derive estimates. Discussions are being conducted with the regulatory authority (the MFSA) on how best to survey investment service providers.

Merchandise trade data are provided to the NSO by the Commissioner of VAT for intra EU trade and by the government’s Customs Department for extra EU trade. Exports are reported f.o.b., while imports are given on a c.i.f. basis.

In addition, the b.o.p. compilers obtain further statistical information on specific current and financial account transactions from various government departments and the External Transactions Information Office of the Central Bank of Malta.

Data on external reserves are based on a stock/flow/income model and are submitted to the b.o.p. compilers by the CBM’s Finance Office on a monthly basis. These data are also used to compile Section 1A of the International Reserves Template.

The i.i.p. is compiled for most sectors of the economy. Details on data sources, concepts, methods and the coverage of the i.i.p. are given in Sub-section 14.1 below.

All b.o.p. and i.i.p. information submitted by reporting agents includes a country breakdown. In the case of merchandise trade data reported by the Trade Section of the NSO, a complete country breakdown is provided. However, a classification by currency of b.o.p. and i.i.p. data is not available.

Additional sources of information for b.o.p. purposes include:

- data on loans and portfolio investment abroad from the CBM’s External Transactions Information Office;
- newspaper clippings on b.o.p. issues and developments;
- the aggregated balance sheet of collective investment schemes, which is provided via

the MFSA. This institution is currently responsible for regulating and supervising all institutions involved in financial services in Malta; and

- annual financial reports of non-financial enterprises.

### 3.2 Reporting Agents

(i) **The monetary authority sector:** the CBM’s statutory functions to conduct monetary policy, promote a sound financial system and advise the government on economic and financial matters are performed mainly on the basis of money and banking statistics compiled by the CBM’s Statistics Office, and b.o.p. and related data compiled by the BOP Section of the Central Bank of Malta and the NSO.

The Finance Office of the Central Bank of Malta prepares the Bank’s monthly balance sheet, which is submitted to the Statistics Office for consolidation with the rest of the banking sector. The Finance Office also submits to the b.o.p. compiler data on external reserves.

The CBM’s Statistics Office is responsible for preparing aggregated money and banking statistics on a monthly basis. It submits such data and selected aggregated items of reserve assets to the IMF for inclusion in the IMF’s International Financial Statistics (IFS) publication. Monetary and related data, including details of reserve assets, are published monthly by the Central Bank of Malta in a report entitled “Release of Monetary Aggregates and their Determinants”.

Detailed tables on monetary and related data are also published quarterly and annually in the CBM’s publications.

(ii) **The banking sector:** the definition of the banking sector in Malta comprises credit institutions and does not include money market funds. The current monthly and quarterly statements and schedules of credit and financial institutions received by the Central Bank of Malta are incorporated in a Banking Directive (BD 06) issued in terms of the Banking Act cap. 371 and in a Financial Institutions Directive (FID 02) issued in terms of the Financial Institutions Act cap. 376. The documents submitted provide detailed information on the financial position of these institutions. They include a balance sheet, a profit and loss account and an appropriation account. The statements and schedules show resident and non-resident stocks and flows separately. Financial account transactions are derived from end-of-period stock positions. Current account transactions are derived from the profit and loss accounts.

A new set of statistical returns have been recently adopted. These new returns are to meet all requirements regarding money and banking statistics. These returns are received on a monthly basis by the Statistics Office of the Central Bank of Malta.

(iii) **General government:** in the latter part of 2004 the general government will be in line with ESA 95 for the purposes of b.o.p. and i.i.p. data collection. The Ministry of Finance is requested by the b.o.p. compiler to provide data on external loans and related interest payments. Moreover, the Ministry of Finance provides information on grants received from overseas by the government, as well as on the acquisition of real estate by non-residents. Service transactions effected by the central government are reported through the partial settlements system.

(iv) **Other sectors:** the corporate sector is surveyed on a monthly basis to provide data on the financial account and related income and service transactions. The response rate for the top companies surveyed, accounting for approximately 85% of total b.o.p. data, is 95%.
response rate for the remaining companies is somewhat lower.

3.3 THRESHOLDS

There are no exemption thresholds stipulated by the b.o.p. compilers. However, the Central Bank of Malta does apply four simplification thresholds when collecting data from banking institutions in connection with its b.o.p. exercise based on banking transactions (partial settlements). These are:

- MTL 100,000 for merchandise trade transactions;
- MTL 10,000 for services transactions excluding travel;
- MTL 25,000 for travel transactions; and
- MTL 10,000 for financial account transactions.

For transactions below these thresholds, no information is required concerning the nature of the underlying transaction or the country of the non-resident counterpart.

No simplification thresholds are applied to other data sources.

3.4 AVAILABILITY OF DATA

B.o.p. data on a transaction basis in line with the BPM5 are available quarterly. However, work is currently under way to compile b.o.p. data on a monthly DR basis. The quarterly b.o.p. data are available before the end of the three months following the end of that quarter. Classifications by sector and instrument are available. However, only in the case of the current account has data been classified by region, i.e. the European Union (EU) and the rest of the world.

External reserves are compiled on a daily basis by the Central Bank of Malta and made available to the b.o.p. compilers both on a monthly basis and on a quarterly basis, in the latter case with additional information.

The i.i.p. data have so far been compiled on an annual basis nine months after the end of the reporting period. The i.i.p. is currently classified by instrument and sector. The information submitted does not include a geographical or currency breakdown.

3.5 DATA CONTROLS

Formal checking and vetting of DR survey forms is carried out on a regular basis. Data are verified using, inter alia, company balance sheets, statistical information collected by the External Transactions Information Office of the Central Bank of Malta and newspaper clippings. Validation checks have been built into the DR software program.

On an aggregate level, checks are also undertaken to ensure consistency between data received from the DR questionnaires and data received from banking institutions covering transactions of the various economic sectors. Particular attention is paid to the magnitude of the errors and omissions item and to large transactions that significantly depart from past trends. The compilers try their best to discover the underlying causes of such movements in the data.

3.6 REVISION POLICY

Quarterly b.o.p. accruals data are revised on a quarterly basis. The previous year’s data remain subject to revision. Data is considered final once published in the annual publication of the NSO entitled “Balance of Payments”. This is normally published one year after the end of the reporting period.

3.7 DISSEMINATION

Users have access to b.o.p. data in regular publications issued by the NSO and the Central Bank of Malta. These include the NSO’s news releases, the b.o.p. publication and yearly economic surveys (issued by the Ministry of Finance), and the CBM’s Quarterly Reviews and Annual Report. The b.o.p. data are
published regularly in IMF and Eurostat publications. Data are also available on the NSO’s website at www.nso.gov.mt. B.o.p. data are disseminated in accordance with the IMF’s General Data Dissemination System (GDDS).

Data on external reserve assets are published regularly on a monthly basis and in the CBM’s quarterly and annual publications. They are also available on the CBM’s website at www.centralbankmalta.com. A detailed statement of external reserve assets is submitted to the ECB by the Central Bank of Malta.

I.i.p. data is published in the NSO’s news releases, the publication entitled “Balance of Payments”, the IFS of the IMF and the CBM’s publications. It is also available on the NSO’s website at www.nso.gov.mt. I.i.p. data is disseminated in accordance with the GDDS.

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

(i) General merchandise: the main source for merchandise trade data is the trade statistics compiled by the Trade Section of the NSO. Adjustments for coverage are subsequently made by the b.o.p. compiler to both imports (reported on a c.i.f. basis) and exports. Thus, merchandise trade data are reported on an f.o.b. basis.

The adjustments that are made to the trade data are also based on information obtained through the issuance of ad hoc letters to various respondents. In addition, deposits and advance payments made on large and exceptional items are also used to adjust the trade data.

(ii) Repairs on goods: data on repairs on goods are collected from the quarterly survey of private and public entities. The data essentially include information about income earned on aircraft and ship repairs carried out locally, as well as expenditure on aircraft and ship repairs carried out abroad.

(iii) Goods procured in ports by carriers: statistical data on goods sold in domestic ports to non-resident carriers are derived from trade statistics, whereas data on goods purchased by resident entities in foreign ports are compiled on the basis of the quarterly survey of resident shipping and airline companies.

(iv) Non-monetary gold: data for non-monetary gold are derived from trade statistics.

4.2 DEFINITION

Goods data conform with the definitions set out in the BPM5. Imports and exports are adjusted on an f.o.b. basis and merchandise trade statistics by country of destination are also compiled.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from the BPM5, except for transactions related to ship repairs and shipbuilding. These are included under general merchandise, whereas in the compilation of cash-based foreign transactions reported by banks, ship repairs are included under services.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

Where shipment data (insurance and freight) are not available separately, the shipment content is estimated at around 10% of the c.i.f. value of the merchandise imports. (see Sub-section 5.1 below).

</table>

1) The compilation of the monthly b.o.p. on the basis of direct reporting is currently under investigation.
5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

(i) \textit{Transportation}: data for transportation services are subdivided into three identifiable categories, namely passenger, freight and other transportation.

Data on receipts and payments for passenger carriage are primarily retrieved from the monthly DR survey carried out for both shipping and airline companies (including their representative agencies operating in Malta).

Data on revenue from freight are derived from the same survey. For freight payments, however, where shipment data (insurance and freight) are not available separately, an estimate of 10\% of the c.i.f. value of imports is made. Of this estimate, 90\% is allocated to freight and the remainder to the insurance payments item (which is included in the current transfers account). A statistical adjustment is made for freight on imports transported by domestic carriers.

Other transportation services are obtained from the monthly DR survey, the monthly b.o.p. settlements-based statement prepared by the Central Bank of Malta and specific data requests sent to the Malta International Airport and the Maritime Authority.

(ii) \textit{Travel}: data on gross earnings from tourism and on gross expenditure by residents travelling abroad are derived mainly from foreign currency transactions reported by banking institutions and other authorised dealers to the Central Bank of Malta on a monthly basis.

During a joint exercise between the NSO and the Central Bank of Malta in 1989, it was found that there was a significant and persistent under-recording of tourism-related foreign exchange transactions reported through the local banks. Subsequently, foreign consultants\footnote{Howarth & Howarth (UK) Ltd. and P.A. Cambridge Ltd.} carried out a study to identify the extent of the under-reporting. Consequently, an upward adjustment of 15\% to gross travel receipts reported by the banks was recommended and is being implemented.

(iii) \textit{Other services}: the primary sources of data for other services are the monthly and annual DR surveys. The data sources for government transactions are the Ministry of Finance and the CBM’s settlements-based system. The latter is also the source of data in respect of transactions of the personal sector.

5.2 DEFINITION

The reporting of services transactions conforms to the definitions and guidelines set out in the BPM5.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from the BPM5, except for transactions in connection with financial services, which are currently classified under other services.

5.4 GAPS

Country data are collected but not yet tabulated pending further developments in the IT software program.

5.5 INTENDED HARMONISATION

A more comprehensive classification of services on a country-by-country basis will be made available once the new IT infrastructure for the DR data collection system is in place.

5.6 ESTIMATION METHODS

Estimates for non-respondents are extrapolated from historical data.
As mentioned in Sub-section 5.1 above, the gross travel receipts reported by banks are inflated by 15%.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES
Data are obtained from the monthly DR questionnaires and from the CBM’s monthly b.o.p. cash statement.

6.1.2 INCOME ON DIRECT INVESTMENT
The main source of data on income on direct investment is the DR questionnaires, which provide information on reinvested earnings, dividends and interest income.

Income is classified by type of financial instrument. A limited geographical classification, i.e. the EU or the rest of the world, is also provided.

Income on equity is recorded in accordance with BPM5 recommendations. Reinvested earnings of all sectors of the economy are reported on an annual basis in the DR FDI questionnaire. Monthly estimates are derived using past data.

When earnings are reinvested, an offsetting entry in the financial account is recorded under direct investment.

With regard to income on debt, income on intercompany loans is recorded as income on direct investment. The DR questionnaires indicate whether the income on loans is derived from a foreign parent company, a subsidiary or other non-resident sources. Income on debt securities between affiliates is recorded as income on direct investment. To qualify as an affiliate, and thus be recorded as income on direct investment, the criterion of a minimum 10% shareholding is applied (see Sub-section 9.2 below for a detailed explanation). If any income on debt is not yet paid/received, an offsetting entry is recorded in the receivables/payables item under direct investment.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
The DR questionnaires provide information on interest on bonds, notes and money market instruments, as well as on dividends on equity. The income on portfolio investment is classified according to the type of portfolio investment instrument. Information on the sectoral classification is also available. The monthly DR questionnaire provides for a full country and sectoral breakdown. However, pending the completion of the IT infrastructure, the geographical classification is limited to two regions, i.e. the EU and the rest of the world. The criterion applied in this regard is the country of the issuer. A currency classification is not available.

Income on equity and debt securities follows the definitions recommended in the BPM5. Dividends are obtained from the monthly DR questionnaire.

6.1.4 INCOME ON OTHER INVESTMENT
There are two main data sources for income on other investment. Financial and non-financial enterprises provide information on interest income and expenditure through the monthly DR survey, which also includes information on income from trade credits. The income of the personal sector is derived from the CBM’s monthly b.o.p. settlements-based statement. The Ministry of Finance provides data on interest payments on the government’s external debt. Income on the external reserve assets of the Central Bank of Malta is provided by its Finance Office and is recorded monthly on an accruals basis.

The definitions of the BPM5 are followed, except in the case of accrued interest of the personal and government sectors.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
None.
6.3 GAPS

See Sub-section 6.2.

6.4 INTENDED HARMONISATION

None.

6.5 ESTIMATION METHODS

In the absence of reliable statistics on the external financial assets and liabilities of the personal sector, estimates are made. An offsetting entry is recorded in portfolio investment and/or other investment. Estimates are also made for monthly reinvested earnings.

7 CURRENT TRANSFERS

See the following section on the capital account.

8 CAPITAL ACCOUNT

8.1 SPECIAL FEATURES OF DATA COLLECTION

Current transfers

(i) General government: data on official transfers, which are shown under this account, are obtained from the CBM’s monthly b.o.p. settlements-based statement.

(ii) Other sectors: aggregated data on personal remittances, pensions and other transfers are also obtained from the CBM’s banking data. Also included under this classification are non-life insurance premiums and claims reported by private and public entities in its quarterly enterprise survey; additional information is obtained through specific data requests.

As from 1995, following the recommendations set out in the BPM5, the data related to current and capital transfers were disaggregated. Hence, data on emigrants’ capital transfers, debt forgiveness and government grants are currently included in the capital account. Data on government grants are provided by the Ministry of Finance, while other related data are obtained from the Central Bank of Malta.

8.2 DEFINITION

The definitions of the BPM5 are adhered to. For the data sources, see Sub-section 8.1.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

There are no gaps. Both migrants’ transfers and the acquisition/disposal of non-produced non-financial assets are currently captured through the CBM’s settlements-based system.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The monthly DR questionnaires are used to collect foreign direct investment (FDI) data from all sectors of the economy with the exception of households. The DR questionnaires are designed in such a way as to identify all inter-company transactions, including loans and trade credits. Information on the acquisition of real estate in Malta by non-residents is provided by the Ministry of Finance. Data on the acquisition of real estate by Maltese abroad is derived from statistical forms submitted to the External Transactions Information Office of the Central Bank of Malta. Direct investment abroad by households is captured through the CBM’s monthly b.o.p. settlements-based statement and statistical.
forms submitted to the CBM’s External Transactions Information Office.

The business register for the largest companies in Malta has been constructed on the basis of detailed information obtained from the CBM’s monthly b.o.p. settlements-based statement. In addition, further information is obtained from the statistical forms submitted to the External Transactions Information Office of the Central Bank of Malta, historical data from the enterprise survey, trade data, annual reports of companies and newspaper clippings.

Data are available by sector and by instrument. A country breakdown will be made available for all sectors of the economy.

9.2 DEFINITION

The 10% ownership criterion is used to distinguish between direct and portfolio investment. This guideline is applied to identify types of investment (i.e. direct or portfolio) relationships in the corporate sector. The monthly DR questionnaire is structured in such a way as to indicate the direction of the FDI relationship.

Special-purpose entities (SPEs) are currently considered non-residents and are included under other investment – currency and deposits.

All transactions between affiliated companies are included under direct investment. Moreover, an offsetting entry for reinvested earnings is shown as part of income and included under FDI. As a general rule, direct investment transactions are recorded when the transactions occur. Geographical allocation of FDI is based on the country of residency of the parent, subsidiary or affiliate, as the case may be.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations from the agreed definition.

9.4 GAPS

Information on the switching of overseas assets between the FDI, portfolio investment and other investment categories by households is not available.

9.5 INTENDED HARMONISING

The statistical treatment of the residency of all SPEs is presently under consideration.

9.6 ESTIMATION METHODS

Estimates for non-respondents are extrapolated from historical data.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on portfolio investment are collected on an aggregated basis. The DR questionnaires are used to collect portfolio investment data. Information on the portfolio investment transactions of households is obtained from statistical forms submitted to the External Transactions Information Office of the Central Bank of Malta and supplemented by information obtained through the CBM’s monthly b.o.p. settlements-based statements. Purchases of domestic equity and debt securities by non-residents on the Malta Stock Exchange (MSE) are reported directly to the b.o.p. compiler by the MSE.

Classifications by country, sector and instrument are available. No currency breakdown is available.

10.2 DEFINITION

The compilation of portfolio investment transactions is generally in line with the BPM5. Equity securities, bonds and notes as well as money market instruments are included in the definition. Service charges, fees and commissions are recorded separately under...
services. Portfolio investment data will be available by country and sector of issuer upon completion of the new IT infrastructure.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations from the agreed definition.

10.4 GAPS

Information on the switching of overseas assets between the FDI, portfolio investment and other investment categories by households is not available.

10.5 INTENDED HARMONISATION

Under the new DR reporting system, surveys of custodians and partial end-investors will also be conducted.

10.6 ESTIMATION METHODS

Estimates of the value of transactions carried out by non-respondents are made. These are based on historical data where these are available.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The monthly DR questionnaires are also used to collect financial derivatives data from all sectors of the economy. The DR questionnaire is structured to differentiate between options and derivatives other than options.

11.2 DEFINITIONS

The compilation of financial derivatives is generally in line with the BPM 5.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations from the agreed definition.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The DR questionnaires are used to record the other investment transactions of all sectors of the economy. The household sector, however, is captured through the settlement system (see Sub-section 3.1) and statistical forms submitted to the External Transactions Information Office of the Central Bank of Malta.

Breakdowns are available by country, sector and instrument. No currency breakdown is available.

12.2 DEFINITIONS

Other investment transactions are generally in line with the BPM 5. Transactions related to repurchase agreements and trade credits are included under other investment.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 12.2 above.

12.4 GAPS

Information on the switching of overseas assets between the FDI, portfolio investment and other investment categories by households is not available.
12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

Estimates of the value of transactions carried out by non-respondents are made. These are based on historical data where these are available.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The Finance Office of the Central Bank of Malta is the source of data on reserve assets. A new reporting form has been introduced to capture b.o.p. and i.i.p. data. This new form provides for an instrument, sector of issuer and country breakdown.

Reserve assets are compiled in accordance with the gross concept.

13.2 DEFINITIONS

The definition of reserve assets is in line with the BPM5. Reserve assets are under the effective control of the Central Bank of Malta. Reserve assets include highly liquid claims on non-residents in foreign currency. Positions in local currency are excluded.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 13.2.

13.4 GAPS

See Sub-section 13.2.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The i.i.p. is compiled annually to show the position at the end of the calendar year (i.e. the reporting period). However, not all financial account items for each sector are compiled. The following is a breakdown by sector of the financial account items, which are compiled:

(i) **banking sector**: compiled for all financial account items;

(ii) **non-financial enterprises (including public companies)**: based on the top 700 companies, all financial account items are compiled, except financial derivatives;

(iii) **households**: the only information available with regard to households is the amount of borrowing/lending with non-residents; and

(iv) **central government**: all financial account items are available with the exception of trade credits and debits.

Reserve assets are included.

Assets and liabilities are compiled separately and Malta’s i.i.p. is published annually in the NSO’s news releases and in the IMF’s IFS.

14.1.2 DIRECT INVESTMENT

The i.i.p. of the banking sector is compiled by instrument and is also available by country. No currency breakdown is available. The main data sources are the banking schedules submitted to the CBM’s Statistics Office. Data are available approximately a fortnight after the end of the quarter and are based on real stock positions.

There are no significant deviations from BPM5 definitions. The valuation criteria used for equity securities are market values, but book values are used for the equity of those banks.
that are not listed on the MSE. However, all other direct investment instruments, such as inter-company loans, are recorded at the end-of-period exchange rates.

The direct investment stock of the non-financial enterprises (including public companies) is compiled by instrument. No country or currency breakdowns are available. Data are compiled on the basis of the quarterly b.o.p. enterprise survey submitted to the NSO. Data are available approximately two months after the end of the quarter.

The stock of long-term financial instruments, with the exception of loans from abroad, is derived from accumulated flows. Short-term instruments are compiled from real stock positions. There are no deviations from BPM5 definitions.

Equity securities are given at book value, but all other direct investment instruments are recorded on the basis of market value. A reconciliation exercise is carried out for the loans of the public entities.

The government sector has no direct investment abroad and no data are available for the household sector.

14.1.3 PORTFOLIO INVESTMENT
The portfolio investment stocks of the banking sector are compiled by instrument. No maturity, country or currency breakdowns are available. As in the case of FDI stocks, the portfolio investment position is available from the banking returns submitted to the CBM’s Banking Supervision Office. Similarly, data on real stock positions are available approximately a fortnight after the end of the quarter and follow BPM5 definitions.

Trading securities are recorded at the lower of book value and market value, but investment securities are based on book value.

The portfolio investment stock position of non-financial enterprises (including public companies) is compiled by instrument. No maturity, country or currency breakdowns are available. Data for this sector are compiled from the quarterly b.o.p. enterprise survey submitted to the NSO. These survey data are available approximately two months after the end of the reference period. The initial portfolio investment stock position is compiled in accordance with the BPM5. However, subsequent stock data are based on accumulated flows. No reconciliation exercise is carried out for portfolio investment.

Data on the government sector is made available by instrument, but there are no country, maturity or currency breakdowns. Real stock positions are collected using the government’s Annual Financial Report (available six months after the end of the year) and replies to quarterly data requests to the MSE on government securities held by non-residents. Market valuation criteria are used and the compilation of the government’s portfolio investment position is in line with the definitions of the BPM5. A reconciliation exercise is carried out taking price changes into consideration.

No data are available for the household sector.

14.1.4 FINANCIAL DERIVATIVES
Data on financial derivatives are not shown separately except for the banking sector.

14.1.5 OTHER INVESTMENT
The other investment stock position of the banking sector is compiled by instrument. No maturity, country or currency breakdowns are available. As in the case of FDI and portfolio investment stocks, the other investment position is available from the banking returns submitted to the CBM’s Statistics Office. Similarly, data on real stock positions are available approximately a fortnight after the end of the quarter and are compiled in accordance with the BPM5. Market valuation criteria are used. As already indicated for FDI and portfolio investment stocks, an estimate to apportion the total revaluation amount is made.
The other investment stock position of non-financial enterprises (including public companies) is compiled by instrument. No maturity, country or currency breakdowns are available. Data for this sector are compiled from the quarterly b.o.p. enterprise survey submitted to the NSO. These survey data are available approximately two months after the end of the reference period. The stock of long-term financial instruments, with the exception of loans from abroad of public enterprises, is derived from accumulated flows. However, short-term assets and liabilities are compiled from real stock positions. A reconciliation exercise is carried out for the loans of public sector enterprises.

The government sector is compiled by instrument, with the exception of trade credits and debits, which are not available. Data for loans by currency are available, but there are no country or maturity classifications. Data on other investment are compiled from replies to specific data requests sent to the Ministry of Finance and information provided by the Statistics Office of the Central Bank of Malta. Data on real stock positions are available approximately two months after the end of the quarter. There are no deviations from BPM5 definitions. Market valuation criteria are used and a reconciliation exercise is carried out taking exchange rate movements into consideration.

The only data available for the household sector are for loans from non-residents. These are compiled on a quarterly basis and based on administrative records submitted to the External Transactions Information Office of the Central Bank of Malta. The only breakdown available is by currency.

14.1.6 RESERVE ASSETS
The source for these data is the Finance Office of the Central Bank of Malta. Data are in line with the BPM5 and a reconciliation is performed on a quarterly basis for price and exchange rate movements.

14.2 DEVIATIONS FROM AGREED DEFINITIONS
See Sub-sections 14.1 to 14.1.5.

14.3 GAPS
See Sub-sections 14.1 to 14.1.5.

14.4 INTENDED HARMONISATION
During 2004 a new DR data collection system has been implemented through which the different sectors will report a full i.i.p. on a monthly basis, including a reconciliation for price and exchange rate movements. The statement should also include a country breakdown.

14.5 ESTIMATION METHODS
See Sub-section 14.1 on the banking sector.

15 CONTACTS
This country information was drafted by Malta in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Malta should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

De Nederlandsche Bank (DNB) has been responsible for compiling full balance of payments (b.o.p.) statistics since 1945. It compiled the first full b.o.p. for 1946, based on a settlement system. In 2003 the transition to a survey system became effective.

2.2 LEGISLATIVE PROVISIONS

Until 1981 the legal basis for the collection of b.o.p. data was the Foreign Exchange Decree of 1945, which established a general prohibition principle that required prior permission for all cross-border transactions. The exchange control regime gradually became more flexible, with a growing list of exceptions to the general prohibition against cross-border transactions. In principle, the External Financial Relations Act of 1981 permits all external transactions unless these are explicitly prohibited. The legislation imposed a general obligation on banks and non-banks to report their external positions and all transactions that are settled on the accounts held with/by non-residents. In return, full confidentiality is ensured. In 1994, the External Financial Relations Act was revised to enable De Nederlandsche Bank to exchange confidential data within the ESCB. In 2004, a similar adjustment occurred for the exchange of confidential b.o.p. information between De Nederlandsche Bank and Statistics Netherlands.

2.3 INTERNAL ORGANISATION

All the statistical activities of De Nederlandsche Bank are centralised within the Division Statistics & Information. This division consists of four departments, one of which is the Balance of Payments & Financial Accounts Department. This department has 51 staff and consists of three sections, which are about equal in size. One section is responsible for overall b.o.p. compilation and the dissemination of all b.o.p. and financial account output. The other two sections are responsible for the production of specific accounts of the b.o.p. and the i.i.p. and the financial accounts for the financial sectors. This entails the complete process of account management, the assessment of micro reports and the production of macro data. To ensure that the micro and macro analysis are well integrated, both account managers and academic analysts are assigned to each section.

The individual b.o.p reports received by De Nederlandsche Bank comprise the data for the financial account, including the i.i.p., related investment income and some additional information. All DNB’s reporting requirements for specific groups of reporting agents are combined in so-called (reporting) profiles. The two sections elaborating the micro data for specific groups of reporting agents assess not only these reports as regards the b.o.p. accounts they compile, but also the other micro data contained in the profiles for these reporting agents.

2.4 EXTERNAL COOPERATION

The transition to the survey system has led to a strategic decision regarding the allocation of tasks between De Nederlandsche Bank and Statistics Netherlands. It implies that Statistics Netherlands provides the greater part of the data for the current account and De Nederlandsche Bank for the financial account. This roughly corresponds with the core business of each institution, viz. the real economy for Statistics Netherlands and the financial economy for De Nederlandsche Bank. The strategic decision furthermore includes cooperation in the field of the registers maintained by both institutions for b.o.p. purposes, including their regular updating and attuning. De Nederlandsche Bank remains responsible for the overall compilation of the b.o.p. and the i.i.p.

The data provided by Statistics Netherlands for the goods account comprise intra- and extra-EU trade. This information is adjusted for the c.i.f./f.o.b. margin. After the adoption of the Intra-
Community Trade Statistical System (Intrastat), the quality of trade statistics diminished. Consequently, Statistics Netherlands’ National Accounts Department makes substantial corrections to the trade data. These corrections are also adopted by De Nederlandsche Bank.

As of the second quarter of 2003, Statistics Netherlands has also been providing quarterly data on international trade in services. To that end, a new quarterly survey was adopted. In 2004 the reporting population for this survey comprised a sample of around 3,100 reporting agents (approximately 10% of the total population).

Furthermore, Statistics Netherlands compiles quarterly data on the compensation of employees and on some items of current transfers, both partly based on estimates.

There are several platforms on which statistical issues regarding the b.o.p. and the i.i.p. are discussed with Statistics Netherlands. This includes the joint analysis of the data provided by Statistics Netherlands, as well as fitting in the b.o.p. data in the national accounts.

2.5 USERS

Links with international organisations generally focus on the dissemination of Dutch b.o.p. data and methodological issues. The Central Planning Bureau (CPB) generally uses national accounts data, although data from De Nederlandsche Bank are also used in the short term and for forecasts. The b.o.p. is also used as input for the Rest of the World (ROW) account compiled by Statistics Netherlands. Detailed b.o.p. data are obtained from De Nederlandsche Bank, especially on a quarterly basis.

Data are supplied to international organisations, such as the ECB, the Statistical Office of the European Communities (Eurostat), the Organisation for Economic Co-operation and Development (OECD), the International Monetary Fund (IMF) and the Bank for International Settlements (BIS), on a regular basis.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The survey system, effective since April 2003, can be defined by the following features. Firstly, the cross-border transactions and positions are basically obtained directly from the residents involved, i.e. through direct reporting. At the same time, it includes some intermediary reporting by banks and custodians, especially in the field of derivatives and portfolio investment, to enhance the efficiency of data collection. Secondly, the collected information does not consist of individual settlements, but of aggregated transactions (and positions), as recorded in the reporting agents’ business administration. Thirdly, the reporting population is largely confined to representative samples.

The reporting requirements of the DNB survey are included in 14 profiles for each specific group of reporting agents. The profiles comprise the main data for the i.i.p (i.e. stocks, including accrued interest), as well as for the financial and investment income accounts of the b.o.p. They include breakdowns by country, sector and type of financial instrument. For most requirements of the profiles, including accrued interest, a full reconciliation between flows and stocks must be reported. The “reconciliation model” implies that all changes between the opening and closing positions of the reporting period need to be explained. The changes are generally broken down into gross transactions, changes in market prices, exchange rate changes and other (e.g. write-offs). Portfolio investments are for the larger part reported on a security-by-security basis with ISIN codes. Only a very limited number of reporting agents prefer to return aggregated portfolio reports.

Most requirements of the profiles, both for stocks and flows, have a monthly reporting frequency. Some data, however, that are generally not available at a monthly frequency, only need to be reported annually. This mainly
concerns the stocks of equity participations and real estate, as well as related profits and losses and reinvested earnings (see also Sub-section 3.2). Direct and other investments of MFIs have been integrated in money and banking statistics. To that end, the reporting requirements for these statistics have been extended to allow for the derivation of flows. Moreover, investment income related to these financial instruments has been included in the reports.

The reporting requirements of the 14 profiles are imposed on sample populations of specific groups of reporting agents (see table). Overall, these samples comprise around 2,100 reporting agents that were drawn in such manner to cover around 95% of total transactions and positions of the complete population (of approximately 43,000 entities). The data for the entities that are not included in the sample are estimated through a grossing-up procedure. This applies notably to investment income and financial stocks. The estimates are based on historical data for these entities. De Nederlandsche Bank does not apply a grossing-up procedure with regard to financial transactions. The estimates may be subject to further adjustments due to benchmarking with additional sources and fitting in the b.o.p. in the national accounts.

3.2 REPORTING AGENTS

(i) MFIs: the profile for DNB comprises the official reserves held by De Nederlandsche Bank. All other portfolio investments of the sampled MFIs (including DNB) are reported through the profile for MFIs. MFIs’ direct and other investments are derived from money and banking statistics. Their reporting requirements also concern cross-border participations in syndicated loans for residents. Additionally, MFIs (and their subsidiaries, notably clearing members and custodians) report data on portfolio investments and derivative contracts of their clients (see Sections 8 and 9).

(ii) Dutch central securities depository (CSD) and custodians (BWB): monthly reports on specific cross-border holdings of securities (see Sub-section 8.1). With regard to the recording of migrants’ transfers, custodians additionally provide data on changes of residency of their clients.

(iii) Special Financial Institutions (SFIs): stock data are only reported annually. As regards investment income, only interest paid and received have to be reported (i.e. no accrued interest and full reconciliation).

(iv) The non-banking sector: the profiles for the non-banking sector to some extent differ for different groups of reporting agents, notably investment companies, insurance companies, pension funds, other financial and non-financial corporations. Basically, however, these profiles all coincide with the general reconciliation model.

(v) The Central Bureau of Statistics: monthly data on goods imports and exports, compensation of employees; quarterly data on international trade in services.

3.3 THRESHOLDS

Since the survey system only collects aggregated transactions, thresholds regarding single payments are not applicable.

3.4 AVAILABILITY OF DATA

A complete b.o.p. on a transactions basis with a full geographical breakdown is available on a monthly basis, after approximately six weeks.

1 DNB originally sampled around 2,800 enterprises. These entities had the option to either return single reports for their own cross-border business, or so-called centralised reports for all sampled and/or other residential enterprises belonging to their group. The use of the latter option has led to about 2,100 entities actually reporting the profiles. In total, these reporting agents represent around 3,500 single enterprises that are included in the centralised reports.

---

1) A profile contains the reporting requirements for a specific group of reporting agents.
2) Annually as regards reinvested earnings and stocks of direct investment and real estate.
3) For monthly and annual requirements, respectively.
4) Pension funds reporting securities with ISIN codes do not need to report transactions and accrued interest for these securities.
These data contain estimates (see Sub-section 4.2) for:

- (in some cases) goods;
- trade in services (quarterly survey);
- reinvested earnings (annual survey);
- short-term trade credits (no survey);
- compensation of employees (quarterly survey, supplemented with estimates); and
- non-government transfers (quarterly survey, supplemented with estimates).

The results of the quarterly surveys mentioned above are generally available three months after the end of the reporting period, whereupon the estimates are substituted by the survey results. As regards outright forwards, only stocks are collected, no transactions.

3.5 TIMELINESS

When the monthly b.o.p. is compiled, almost 95% of the monthly reports have been received and processed. There is a system of monthly formal reminders which, if necessary, are followed up by administrative fines.

3.6 COMPILATION FREQUENCY

The Dutch b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

E-line Bop, the application for data transmission, contains two on-line logical tests of the data that need to be reported. One test checks for each financial instrument whether the sum total of the opening balance and all reported changes add up to the closing balance. The second test compares the closing balance of the previous and the opening balance of the present reporting period, which must be identical. If logical errors are found, the data cannot be transmitted before the reporting agent has adjusted them. As a result, the need to assess the plausibility of the micro data received by De Nederlandsche Bank is limited. Attention, therefore, is especially focused on the macro results, which may of course lead to the detection of (implausible) outliers at the micro level.

3.8 REVISION POLICY

At the micro level the data are revised and corrected on an ongoing basis, as new information becomes available. Once every quarter, all changes of the previous six months are processed in the macro data and assessed, leading to a revision of the data for the two previous quarters. In principle, only once a year (in September) are all previous quarters (14 quarters) revised (3 years in total).

3.9 PUBLICATION

Sub-section 13.1 gives a survey of b.o.p. publications of De Nederlandsche Bank. It also contains the website on which the b.o.p. statistics are published. The website includes the release calendar.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

De Nederlandsche Bank provides a preliminary, monthly b.o.p. on a transactions basis after six weeks for all requested items. It includes a breakdown between the euro and non-euro area, as well as a split between euro-area assets and liabilities for portfolio investments. As of June 2004, it also contains a more detailed geographical breakdown (according to step 3). Estimates (or imputations) at the level of individual reporting agents are made for non-response. In Sub-section 3.4 an overview is given of the other estimates contained in the monthly b.o.p. statistics.

4.2 ESTIMATION METHODS FOR THE MONTHLY B.O.P.

4.2.1 FOR GOODS

External trade statistics are compiled by Statistics Netherlands on the basis of customs
declarations and Intrastat for extra- and intra-EU trade, respectively. These data are available within six weeks. Both intra-EU and extra-EU trade statistics are compiled according to the country-of-consignment principle. The c.i.f./f.o.b. margin is calculated by Statistics Netherlands through the so-called f.o.b. delivery terms method. Insofar as the customs declarations include f.o.b. delivery terms, these are applied as a proxy to calculate the margins for country groups. The same method is used to calculate the margins for intra-EU trade, based on the customs declarations from non-EU European countries (adjusted for the average distances from the Netherlands).

4.2.2 FOR SERVICES
Monthly data on trade in services, broken down by, transport, travel and other, are extrapolated from historical data by means of an ARIMA model. After the results of the quarterly data are obtained, a similar method is used to distribute the data over the separate months that are included in the quarter.

4.2.3 FOR INVESTMENT INCOME
Reinvested earnings, which are included both in the income and the financial account, are estimated for the current year as the average of reinvested profits over the previous three years. This is done at the level of individual reporting agents. The estimates are revised once the actual data on reinvested earnings have been collected through the annual reports, which reporting agents need to submit within four months after the end of their financial year. Income on real-estate liabilities is estimated by applying a gross yield on the reported stocks.

4.2.4 FOR OTHER ITEMS OF THE CURRENT AND CAPITAL ACCOUNT
The following information is only collected (and partly estimated) on a quarterly basis:

- compensation of employees; and
- social security and other (non-government) current transfers.

Non-produced and non-financial assets are collected through the quarterly survey for trade in services. The estimates for the current and previous months are made in the same manner as for trade in services (see Sub-section 4.2.2).

4.2.5 FOR DIRECT INVESTMENT
See Sub-section 4.2.3.

4.2.6 FOR PORTFOLIO INVESTMENT
No estimates are used.

4.2.7 FOR FINANCIAL DERIVATIVES
No estimates are used.

4.2.8 FOR OTHER INVESTMENT
No data on short-term trade credits are collected in the survey system. All data for this item are estimated. The estimates are made through an econometric model which relates the supply of short-term trade credit (on the asset side) to exports and the demand for short-term trade credit (on the liabilities side) to imports. The model’s results effectively mimic an inventory process, whereby trade credits supplied and demanded in a given month are compiled from trade credits from the same month plus a certain percentage of the trade credits from previous months. The percentages thus decline for months further back, so as to take redemptions into account.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
Investment income is collected through the general direct reporting system, i.e. the reconciliation model (see Sub-section 3.1). Dividends are recorded as of the date they are paid. All interest income is recorded on an accruals basis, except for SFI earnings (see also Sub-section 3.2).

5.1.2 INCOME ON DIRECT INVESTMENT
Reinvested earnings on equity participations are collected annually. Reporting agents have to
submit this information within four months after the end of their financial year. After this information has been received from a reporting entity, the estimates regarding its reinvested earnings are replaced (see Sub-section 4.2.3). The annual reporting requirements also include the stocks of direct investment equity (at market prices). Income on direct-investment debt, like on all other interest-bearing debt, is reported on an accruals basis.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
See Sub-section 5.1.1.

No difference is made in the system between normal shares and shares in collective investment institutions. Distributed income from shares in collective investment institutions is therefore treated as dividend income and is recorded when paid.

5.1.4 INCOME ON OTHER INVESTMENT
See Sub-section 5.1.1.

5.2 DEFINITIONS

De Nederlandsche Bank complies with most of the recommendations set out in the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserve Statistics (WG-BP&ER).

5.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from agreed definitions.

5.4 GAPS

No data are collected on reinvested income from investments in collective investment institutions. Instead, reinvested earnings in this case are recorded as price changes. No data are available on income from short-term trade credits. The amounts involved are expected to be relatively small, because in many cases no interest is charged on short-term trade credits.

5.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

5.6 ESTIMATION METHODS

See Sub-section 4.2.3.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Non-produced and non-financial assets are collected through the quarterly survey for trade in services of Statistics Netherlands. Other items of the capital account are integrated in the general reporting system (see Sub-section 6.4). The distinction between current and capital transfers according to the BPM5 is problematic, since it requires information on the use of funds abroad which is generally not available. Information from Eurostat on European Commission accounts is used to estimate this breakdown.

6.2 DEFINITION

In principle, De Nederlandsche Bank complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the WG-BP&ER.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from agreed definitions.

6.4 GAPS

Coverage is poor in the case of other sectors.

6.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.
7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on direct investment are collected through the general direct reporting system, i.e. the reconciliation model (see Sub-section 3.2). Information is collected on equity investments, equity-related investments, and various types of inter-company assets and liabilities. For each of these direct investment instruments a distinction is made between long- and short-term loans, financial leases, repurchase agreements, long-term trade credits, inter-company current accounts, and other assets and liabilities. For both assets and liabilities, a further breakdown is made between positions vis-à-vis the direct investor and the affiliates (directional principle).

Reporting agents included in the sample population have to submit annual reports on the stocks of equity participations within four months after the end of their financial year. Geographical breakdowns are based on the residency of the actual debtor or creditor. Financial derivatives contracted between affiliates (excluding the MFI sector) are not identified separately and are included in financial derivatives.

Direct investment (and other investments) of MFIs are integrated in monthly money and banking statistics. Additionally, banks have to report direct investment stocks (at market prices), revaluations and profits paid and retained as an integral part of their annual reports on foreign affiliates, collected for prudential purposes.

7.2 DEFINITION

De Nederlandsche Bank complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the WG-BP&ER. Also the guidelines of the “Fully Consolidated System” of the OECD benchmark definition are followed.

7.3 DEVIATIONS FROM AGREED DEFINITIONS

The 10% rule is not strictly adhered to. In the Netherlands direct investment is assessed according to effective control according to the reporting entity. This treatment does not lead to significant deviations from the agreed concepts. If a large investment is found to bear the features of a direct investment, the investor will be consulted.

7.4 GAPS

Final data on reinvested earnings are generally available within nine months. Preliminary data are available after six months, at which point a provisional international investment position (i.i.p.) is compiled.

7.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

7.6 ESTIMATION METHODS

Reinvested earnings are estimated for the current year (see Sub-section 5.6).

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on portfolio investment assets (foreign securities) are collected through the general direct reporting system (see Sub-section 3.2), except for holdings of households which are collected from custodians. Data on portfolio-investment liabilities (domestic securities), on the other hand, are collected by means of the depository approach, which combines direct and indirect reporting (notably by Dutch custodians and the CSD)\(^2\). Both portfolio assets and liabilities are compiled on the basis of economic ownership. The data collected from

---

\(^2\) The method was referred to as the “mixed approach for portfolio liabilities” in Chapter IV of the Task Force on Portfolio Investment Collection Systems’ Final Report of June 2002.
the reporting agents, however, relates to their legal ownership. In their reports this information is supplemented with data on securities lent to and borrowed from non-residents. The latter information allows for the transformation of the reported data from legal into economic ownership.

Reporting by ISIN code is not compulsory, although practically all of the data is reported in this way. When investments are reported without ISIN code, reporting agents have to submit a full reconciliation of stocks, flows and revaluation, including interest accrued for debt, on a monthly basis. Reporters have to submit all data classified by country and sector of the issuer and by type of instrument (shares, bonds and notes and money market instruments). When reporters use security-by-security reporting, stocks are reported as number of shares for equity or nominal value for debt. The market value of stocks, price and exchange rate changes and interest accrued is calculated by the compilation system. The system also classifies the data by country and sector of the issuer.

The transformation of the data reported by ISIN code is based on data from a securities database containing information for over 450,000 securities. The database, which is updated daily using information from a commercial data provider, contains information on:

- ISIN code and other security identification codes
- type of security (by ESA 95 instrument classification);
- outstanding capital (number and value of shares/debt);
- issue date and price;
- monthly price information including its source;
- interest (fixed/ floating, current coupon rate), and
- the issuer (name, sector, country of residence).

8.2 DEFINITION

In principle, De Nederlandsche Bank complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the WG-BP&ER.

The geographical allocation criteria used are debtor/ creditor for both stocks and flows.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations.

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

8.6 ESTIMATION METHODS

No estimates are used for portfolio investment.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on financial derivatives are collected through the general direct reporting system, i.e. the reconciliation model (see Sub-section 3.2). Data on contracts traded directly on foreign exchanges and on OTC contracts are collected directly from the reporting agents. Contracts traded on foreign exchanges but executed through domestic banks and clearing members, on the other hand, are collected from the banks and clearing members concerned. Information regarding contracts executed by non-residents on the domestic derivative exchange is also collected from resident banks and clearing members. Reporting agents must submit a full reconciliation of stocks, flows and revaluation on a monthly basis. Revaluations do not need to be broken down further into price and exchange rate changes.
9.2 DEFINITIONS

The data are reported by instrument:

- options (including warrants);
- futures (variation margins);
- forward rate agreements;
- interest rate swaps (only swaps where no principals are exchanged);
- cross-currency interest rate swaps (including other swaps);
- outright forwards and foreign exchange swaps (forward legs only); and
- all other OTC contracts.

For exchange-traded derivatives, the geographical allocation is made according to the country where the exchange is based or, in the case of a contract traded on a Dutch exchange, the country of residency of the client. OTC contracts are allocated to the country of the actual counterpart.

Transactions for assets and liabilities are collected separately, except for interest rate swaps. For these types of contracts receipts are recorded as transactions in assets and payments as transactions in liabilities, which is in line with IMF proposals. Transactions in outright forwards are not collected at all.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from the definitions given in the BPM5 or those agreed within the WG-BP&ER.

9.4 GAPS

Receipts on interest rate swaps are considered as transactions in assets. Payments on interest rate swaps are considered as transactions in liabilities. Transactions in outright forwards are not collected.

9.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

9.6 ESTIMATION METHODS

No estimates are used for financial derivatives.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on other investments are collected through the general direct reporting system, i.e. the reconciliation model (see Sub-section 3.2). The items of the other investment account are broken down by long- and short-term loans, financial leases, repurchase agreements, long-term trade credits, current accounts and other assets and liabilities. For both assets and liabilities, the foreign counterparts are broken down by banks and non-banks.

Short-term trade credits are estimated through an econometric model which uses merchandise trade data as explanatory variables (see Sub-section 4.2.8).

Other (and direct) investments of MFIs are included in money and banking statistics (see also Sub-section 3.2).

10.2 DEFINITION

In principle, De Nederlandsche Bank complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the WG-BP&ER.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no serious deviations from the definitions given in the BPM5 or those agreed in the WG-BP&ER.

10.4 GAPS

None.
10.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

10.6 ESTIMATION METHODS

Transactions for short-term trade credits are estimated (see Sub-section 4.2.8).

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on securities and financial derivatives are collected through the general direct reporting system (see Sub-section 3.2). Data on monetary gold, receivables from the IMF and currency and deposits are derived from monthly balance sheet information, broken down by currency and by country.

11.2 DEFINITION

Since January 1999 the Eurosystem’s definition of reserve assets has been applied.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations from the Eurosystem’s definition.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

No further harmonisation efforts are planned.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The stock data for the i.i.p. are mostly collected on a monthly basis through the general direct reporting system, i.e. the reconciliation model (see Sub-section 3.2). Stocks of equity participations and real estate are collected annually, only. Reporting agents must complete their annual reports on these items within four months after the end of their financial year. The annual reports contain a full reconciliation between transactions and stocks (i.e. revaluations, profits and dividends are reported separately) and a complete breakdown by country. For Special Financial Institutions, all stock data (including accrued interest) are only collected annually. These annual reports include a full reconciliation for all items (standard components) of the financial account.

Data on reserve assets are collected from administrative sources at De Nederlandsche Bank.

12.2 DEFINITIONS

12.2.1 GENERAL

In principle, all data comply with the definitions set out in the BPM5 and those agreed by the WG-BP&ER. All positions are valued at end-of-year market prices and exchange rates, except for direct investment equity positions, which are generally based on the net asset value of the participations and, in some exceptional cases, (i.e. minority participations) on (historical) book values, especially if no “market values” are available.

12.2.2 DIRECT INVESTMENT

The 10% rule is not strictly applied, although – in practice – quantitative differences are negligible (see Sub-section 7.3).

12.2.3 PORTFOLIO INVESTMENT

In principle, all data comply with the definitions set out in the BPM5 and those agreed by the WG-BP&ER.

12.2.4 FINANCIAL DERIVATIVES

Since data on stocks are collected through the general reporting system, the relevant definitions for stocks are the same as for transactions (see Section 9). For exchange-
traded futures, no data on positions are collected, as all positions are assumed to revert to zero owing to the practice of daily marking-to-market.

12.2.5 OTHER INVESTMENT
In principle, all data comply with the definitions set out in the BPM5 and those agreed by the WG-BP&ER.

12.2.6 RESERVE ASSETS
As agreed by the WG-BP&ER, the Eurosystem’s definition of reserve assets was applied for the first time in the i.i.p. for end-1998.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
There are no serious deviations from agreed definitions.

12.4 GAPS
Survey data on direct investment are finalised after nine months. The data on direct investment included in the i.i.p., which are compiled six months after the end of the year, are therefore provisional.

12.5 INTENDED HARMONISATION
No further harmonisation efforts are planned.

12.6 ESTIMATION METHODS
Since the data collection on direct investment stocks is only completed after nine months, preliminary totals on behalf of the compilation of the i.i.p. after six months are estimated. These estimates, which are broken down by country and sector, are based on the survey results received up to that moment.

Stocks of short-term trade credits are estimated (see Sub-section 4.2.7).

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Oesterreichische Nationalbank (OeNB) is responsible for producing the following macroeconomic statistics: monetary, balance of payments (b.o.p.), international investment position (i.i.p.) and financial account statistics.

The OeNB has been responsible for compiling the Austrian b.o.p. statistics since 1946. The system for collecting and compiling the statistics has altered over time to reflect the dramatic development of the international integration of the Austrian economy over the past three decades and the liberalisation process which took place during the 1980s. The exchange controls in Austria were totally abolished on 4 November 1991 and resulted in a completely revised data collection and compilation system with effect from November 1991. First figures from the new system were published for January 1992.

In order to adapt to recommendations laid down in the 5th edition of the IMF Balance of Payments Manual (BPM5) and to meet the additional requirements deriving from Austria’s obligations to the European Commission (Eurostat) and to the European Central Bank (ECB) in the field of b.o.p. statistics, a major restructuring of the internal compilation system took place between 1996 and 1998. This was carried out without significant changes to the established data collection system and without imposing any additional burden on the reporting agents.

Since the impact of external transactions on the Austrian economy is considerable, b.o.p. statistics are seen as an essential ingredient in monetary, exchange rate and general economic policy. In order to improve the analytical value of these statistics, as well as to meet international standards, such as those established by the International Monetary Fund (IMF), several conceptual and presentational changes were introduced. The system in place before the major statistical revision in 1991 had been implemented in 1974. In 1978 the definition of external reserves was brought into line with the IMF standards. In 1982 the coverage of the current account was extended in the sense that the difference between trade figures and payments for goods was included in the current account and excluded from errors and omissions.

The following chapters reflect the status of the collection and compilation of b.o.p. statistics in Austria as of January 1998 (reporting period). The implementation of data requirements outlined in the Guideline of the European Central Bank on the statistical reporting requirements in the field of balance of payments and international investment position statistics, and the international reserves template (ECB/2003/7) is reflected in the Austrian system, as are the data requirements laid down in the BPM5 and the ESA 95.

2.2 LEGISLATIVE PROVISIONS

Resident banks and non-banks are obliged to report all cross-border transactions and related stocks to the OeNB under the Foreign Exchange Law of 2004 (Devisengesetz 2004, BGBI No. 123/2003); detailed reporting requirements may be published by the OeNB in form of Regulations (Verordnungen). So-called Official Announcements of the OeNB (Kundmachungen) concerning reporting requirements, which were originally based on the predecessor of the Foreign Exchange Law of 2004 and published prior to 2004, are still valid under the new law and will continue to be used as a basis for the existing collection system until the end of 2005 when a new collection regime will be established on the basis of new Regulations. These new Regulations will be published by mid-2004.

Data reported by Austrian residents are only used for statistical purposes. A strict confidentiality regime is applied.
2.3 INTERNAL ORGANISATION

The OeNB has a separate Statistical Department. The production of basic statistical information (primary statistics) is concentrated in two divisions within this department, namely the Banking Statistics and Minimum Reserve Division and the Balance of Payments Division.

The Banking Statistics and Minimum Reserve Division is in charge of the compilation, publication and observation of banking statistics, statistics concerning investment institutions, and interest rate statistics as well as the BIS Banking Statistics. The Balance of Payments Division is responsible for the compilation, publication and analysis of data on Austria’s external economic relations, namely its b.o.p., i.i.p. (including external debt statistics), portfolio investment (flows and stocks) and direct investment (flows and stocks). The compilation and publication of financial accounts statistics are also carried out by the Balance of Payments Division in cooperation with the Accounting Department, the Banking Statistics Division and the Economic Analysis Division.

The Balance of Payments Division of the OeNB comprises 44 staff members at present. B.o.p. and i.i.p. statistics are compiled and published by a unit composed of 12 members. The group is supported by a data collection unit responsible for reports received from banks and non-banks (17 members). The Head of the Division has one deputy and is advised directly by the Macroanalysis and Quality Control Unit, which is composed of eight members. Financial accounts are compiled by two staff members. Administrative duties are carried out by three staff members.

The Data Collection Unit is responsible for the availability of reports by banks and non-banks within the time and in the format requested. The group also prepares guidelines for the reporting agents and runs the master file of the securities database (individual securities according to ISIN codes).

The Macroanalysis and Quality Control Unit is responsible for the current quality control of the reporting system, including the preparation of estimation methods and contact with the IT Section. This group also carries out the macroeconomic analysis of the b.o.p. and i.i.p. figures, i.e. the relationship between the b.o.p., the i.i.p. and the financial accounts. In addition, members of this unit deal with SDDS coordination for Austria, monitor reporting to international institutions, maintain a Statistics Hotline and coordinate an institution-wide economics database.

2.4 EXTERNAL COOPERATION

For the compilation of b.o.p. statistics, the OeNB cooperates with other statistical authorities in Austria, but retains overall responsibility for their production. The OeNB and Statistics Austria, the Austrian Statistical Office (Statistik Österreich), liaise to compile data for the current account and, in particular, data relating to trade in goods items. The official foreign trade statistics collected by Statistics Austria have always been used in the b.o.p., as well as in the national accounts. Several external sources are used for the compilation of the Austrian b.o.p. In this context, as well as in their capacity as users, the OeNB cooperates closely with Austrian economic research institutes and with the Austrian Government. National accounts statistics are compiled by Statistics Austria. In this context, current account data of the OeNB are used for the calculation of the gross domestic product (GDP). An ongoing evaluation of the respective methods and figures is carried out by the OeNB and Statistics Austria. The aim is to achieve consistency between the Rest of the World sector and the corresponding b.o.p. data.
Outside Austria the Balance of Payments Division maintains close contact with other central banks which involves, inter alia, the exchange of data. Naturally, contacts with the ECB have been of particular importance in this context since the start of Stage Three of Economic and Monetary Union (EMU), given that the Balance of Payments Division has to fulfil reporting obligations vis-à-vis the ECB. The OeNB has also developed close contacts to eastern European Countries. Among various other forms of (bilateral) support, various activities are undertaken for the Joint Vienna Institute, which was established by five international organisations (the BIS, the EBRD, the IBRD, the IMF and the OECD).

2.5 USERS

B.o.p., i.i.p. and special direct investment data are sent to the following international organisations: the European Commission (Eurostat), the ECB, the BIS, the IMF and the OECD.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The current b.o.p. system, which was introduced in 1991, is a “closed system” which is self-balancing for the banking sector as well as for the non-banking sector. Reports received from the banking sector comprise accounts held abroad by domestic banks and accounts held with domestic banks by foreign banks and non-banks. The reports of non-banks comprise accounts held abroad, inter-company working balances and clearing accounts. The system is based on the continuous monitoring of foreign payments.

The reports of banks and non-banks basically consist of stocks at the beginning of the period, stocks at the end of the period and a complete and detailed classification of all credit and debit transactions that led to the change of the stocks. The classifications of transactions often contain detailed information such as the Austrian and/or foreign counterpart, the security concerned, the transaction country, etc. These reports have to be produced for every combination of currency, country and type of accounts relevant to the b.o.p. (short/long-term, deposits/loans, assets/liabilities, etc.). The stock data are used for the compilation of the i.i.p. (mainly other investment) and the transactions are incorporated into all areas of the b.o.p. Some transactions that are not considered relevant for the b.o.p. are also included in the i.i.p. as price or other adjustments.

Information taken from a comprehensive company database is automatically used to make correct sectoral allocations of reported transactions, particularly in the area of income, transfers and the financial account.

In addition, stock data on portfolio investment are collected from banks and non-banks for a comprehensive securities database. The securities stock data are used in combination with the securities database to make accrual calculations for the flow statistics (portfolio investment income and offsetting entries in financial account) and to check and, if necessary, correct the securities transactions included in the above-mentioned stock and transaction reports. This reconciliation of flows and stocks may also lead to a correction of stock data. Information from the securities database is also used to derive automatically a correct geographical, instrumental and sectoral allocation for the securities transactions and stocks. Additional details of this system are given in Sub-section 8.

Annual surveys are conducted in the area of direct investment stocks. Apart from its incorporation into the i.i.p., the information is also used to check information on direct investment transactions. Data on direct investment relations between Austrian and foreign companies derived from the surveys are used to identify automatically flows and stocks of direct investment loans and flows of direct investment income reported elsewhere. </tbody>
</table>
survey data are also used to estimate reinvested earnings in combination with general economic indicators (such as nominal GDP) and expectations. In the area of direct investment it is also common practice to use information from various news sources to anticipate and identify direct investment transactions. In order to reduce the reporting burden for respondents, direct investment cases below certain thresholds (below €370,000 for direct investment in the reporting economy and below €750,000 for direct investment abroad) only have to be reported every two years. These cases are surveyed alternately, i.e. one-half of those enterprises whose direct investment relations fall below the above-mentioned thresholds fill in the reporting form in one year, while the other 50% of those enterprises report in the following year. For those enterprises, which do not report direct investment stocks for a certain period, estimates are made on the basis of the report of the previous year.

Annual and quarterly surveys of trade credits are incorporated both in b.o.p. and in i.i.p. statistics.

For the current account, commodity trade figures are based on the official foreign trade statistics; however, settlement data are an important and timely source of information, especially for preliminary data on trade in goods items. These settlement data are used for the monthly b.o.p., while the commodity trade figures are incorporated into quarterly and annual statistics.

For the travel item in the services item of the current account, an external source is used in addition to the data taken from the general reporting system. A private institute is conducting a survey on behalf of the OeNB to gather data on the travel expenditure of Austrians abroad. The results are mainly used to derive the overall value and the geographical allocation of the debit side of the travel item, to determine the amount of goods bought by travellers abroad and to determine the purposes of their visits.

3.2 REPORTING AGENTS

(i) The banking sector: the following entities are included in the reporting obligations for the banking sector: credit institutions, building and loan associations (Bausparkassen), enterprises which carry out factoring business and all enterprises undertaking business similar to “banking”. According to the Foreign Exchange Act (Kundmachung DL 1-3/91, 2/93, 1/96), banks are required to report (on a daily/monthly basis) all transactions carried out via the domestic banking system, including transactions on behalf of their customers. More specifically, they report the following:
– all settlements carried out through the accounts of domestic banks held abroad and through the accounts of foreign banks and non-banks held by domestic banks as well as the beginning and end-of-month stocks of these accounts (Devisenstandmeldung); daily or weekly reporting is possible if preferred by the reporting agent;
– all sales/purchases and (beginning/end-of-month) stocks of foreign currency transactions (Valutentableaumeldung, over-the-counter or OTC money); and
– monthly stocks of securities, as defined in the BPM5, which banks acting as primary custodians hold for their own account or on behalf of their resident and non-resident customers (Wertpapierstandmeldung).

In addition, banks (acting as a direct investor and/or as a direct investment company) are requested to respond to an annual survey concerning direct investment if the value of the nominal capital of the direct investment exceeds the threshold of €75,000 and 10% of overall nominal capital. If the nominal capital does not exceed €75,000, but the balance sheet total of the direct investment enterprise exceeds €37 million and the 10% criterion
is also fulfilled, banks also have to respond to the direct investment survey.

(ii) The non-banking sector (enterprises and households not included in sub-paragraph (i) above): according to the Foreign Exchange Act (Kundmachung DL 1-3/91, 2/93, 1/96), non-banks are required to report all settlements and stocks on accounts held by banks abroad as well as settlements and stocks of short-term and long-term loans granted to non-residents or provided by non-residents to residents on a monthly basis if the annual volume of transactions exceeds a certain threshold (AuslandskontenMeldung). Stocks of fixed-term assets (deposits) and stocks of securities held by banks abroad have to be reported by non-banks on a yearly basis.

Non-banking private companies and private households (acting as a direct investor and/or as a direct investment company) are requested to respond to an annual survey concerning direct investment if the value of the nominal capital of the direct investment exceeds the threshold of €75,000 and 10% of overall nominal capital. If the nominal capital does not exceed €75,000, but the balance sheet total of the direct investment enterprise exceeds €37 million and the 10% criterion is also fulfilled, non-banks also have to respond to the direct investment survey.

In addition, companies have to submit quarterly and annual surveys (covering a selected smaller sample and a larger, more comprehensive sample, respectively) on trade credits.

(iii) General government: public authorities report all transactions of relevance to the b.o.p. to the OeNB. In addition, some data which are used for checking purposes are received from the Federal Ministry of Finance (particularly concerning the area of current and capital payments of the public sector vis-à-vis EU institutions).

(iv) Monetary authority: the OeNB reports on the external monetary position and monthly flows and stocks in the same way as the banking sector. Special quarterly reports on stocks and flows are also compiled by the Accounting Department of the OeNB for b.o.p. purposes. These reports are mainly used to check monthly flows, to obtain data on an accruals basis and to calculate reserve assets for the i.i.p.

3.3 THRESHOLDS

The reporting guidelines for banks include the possibility of an exemption threshold for all customer transactions below €12,500 since 1 July 2002. In order to avoid costly changes in the compilation procedures, both for the compiler and for the respondent, however, it was agreed with reporting banks to continue to use a simplification threshold on a voluntary basis. These transactions are reported with a special code and the b.o.p. classification is carried out by means of estimations. This estimated item allocation of payments below the threshold concerns almost all areas of the b.o.p. and is not separately listed under estimation methods in the following sections. The contributions of these estimations to the various items can be significant.

The present threshold for reporting by the non-banking sector is €2,500,000, based on the annual turnover in cross-border transactions. These transactions include inter-company working balances and clearing accounts. In addition, non-banks have to report merchanting transactions if an individual transaction exceeds the threshold of €12,500.

Above the threshold of €75,000, fixed-term assets (deposits) and portfolio investment stocks held abroad require annual reports.

3.4 AVAILABILITY OF DATA

The b.o.p. is available monthly on a cash basis with a limited breakdown and quarterly on a transaction basis with more details for
individual items as well as for partner countries. Data for trade in goods items are currently only available after a long delay, owing to problems concerning the collection of intra-EU trade figures via the Intra-Community Trade Statistical System (Intrastat). Therefore, the foreign trade data of Statistics Austria are only used for the b.o.p. goods item on a quarterly basis. Settlement data are used for the goods item on a monthly basis.

3.5 TIMELINESS

The OeNB compiles monthly b.o.p. data within six weeks of the end of the reporting period. At the same time, a country-by-country geographical breakdown is produced internally. However, the timeliness of complete b.o.p. data largely depends on the availability of data for trade in goods, which are provided by Statistics Austria.

3.6 COMPILATION FREQUENCY

The Austrian b.o.p. is compiled on a monthly basis.

3.7 DATA CONTROLS

Formal data controls are carried out once data have been received from reporting agents. These checking procedures for individual reports include controls concerning completeness, consistency and the elimination of double reporting. Mistakes are corrected by transmitting queries to the reporting agents. Once the checks have been completed a first aggregation of the data is undertaken for both flows and stocks.

This first aggregation leads to the data being broken down geographically and by currency and for each reporting agent, as well as by the type of report, and results in up to 300,000 separate data fields existing simultaneously at this level of aggregation. At this stage the regional and currency classification scheme is transformed into building blocks for b.o.p. statistics and the i.i.p. The building blocks for the b.o.p. contain up to 1,000 information fields, the regional building blocks from 10,000 to 20,000 and the currency building blocks from 6,000 to 10,000. Plausibility checks and data content checks are carried out at this stage of the compilation process. Among the other methods applied, the development of different items which are economically linked to one another is compared (ratio analysis). In addition, significant transactions are checked on an individual basis. Comparisons with previous periods are used to assess plausibility. Again, reporting agents are asked for clarification in the event of discrepancies being detected.

Once both formal and plausibility controls have been completed, a first “round up” of preliminary results is made for the reference period. Any discrepancies detected at a later stage are only included in the revision process (see Sub-section 3.8). After three years, individual reports are destroyed for reasons of confidentiality.

3.8 REVISION POLICY

Regular revisions as of the reporting period January 1998:

Monthly b.o.p. data on a cash basis are produced and published without subsequent revision. The monthly b.o.p. data are used mainly as a source of quickly available information which is aimed at providing a rough assessment of trends based on the accumulation of monthly data actually given. This type of data is not usually subject to major corrections. More detailed information on a transactions or an accruals basis is only incorporated in the quarterly and annual data. Consequently, the data for the three months do not add up to the quarterly data. Quarterly and annual data are published with a time-lag of three months in a “provisional” version.

Quarterly data are usually revised when data for another quarter from the same reference year is published. This means that, for example, the publication of the data for the fourth quarter of a
3.8 REFERENCE YEAR

The reference year coincides with a revision of the data for the first three quarters. These revisions of quarterly and annual data are completed in September (T + 9 calendar months) of the following calendar year. At this point in time the latest available figures or estimates on reinvested earnings, trade credits and all other revisions that might have occurred for the reference year are incorporated. Then the data for the reference year have the status of revised figures and are not changed for the following 12 months. The last revision of quarterly and annual data is completed 21 calendar months after the end of the reference year. Then the data have the status of final figures. The main reasons for the revisions are updates of figures concerning trade credits and direct investment based on information from the latest available surveys. This policy for the revision of national data is largely consistent with the revision policies of the ECB and EUROSTAT for euro area and EU aggregates.

More frequent revisions of historical data: new requirements, changes of the underlying b.o.p. concepts or general improvements in the reporting and compilation system lead to more frequent revisions of historical data. The length of the revision period may vary depending on the circumstances.

3.9 PUBLICATION

The OeNB publishes monthly b.o.p. data on a cash basis as well as revised quarterly and annual data on a transactions basis, including trade figures and investment income on an accruals basis.

The titles of the publications produced by the OeNB on b.o.p. statistics are listed in Sub-section 13.1.

The main user of b.o.p. and i.i.p. data within the OeNB is the Economic Analyses Division, which uses them for the purpose of general economic analyses and for the compilation of financial accounts.

In Austria b.o.p. and i.i.p. data are mainly relevant for the following institutions with which the OeNB exchanges data on a regular basis:

- the Austrian Statistical Office (Statistics Austria) for the purpose of the System of National Accounts;
- government ministries and other government institutions;
- the Chamber of Commerce, Chamber of Labour and similar official institutions that play a major role in Austria’s social and economic system; and
- private research institutes (i.e. WIFO and IHS) for analysis and forecasting purposes.

The data sent to the WIFO are included in a database maintained by this research institute which is publicly accessible and which is seen as an important source of economic information within Austria.

Apart from those main clients, data are delivered upon request and/or on a regular basis to students, private companies and commercial banks. The latter mainly use the data for the purpose of drafting brochures for promoting Austrian bonds.

The main clients abroad are the ECB, the European Commission (Eurostat), the IMF, the OECD and the BIS.

Statistical data from the OeNB are available on the Internet at the following address: http://www.oenb.co.at. This OeNB website includes all the b.o.p. and i.i.p. data that are published in the monthly statistical bulletin and additional b.o.p. data, in particular data concerning the current account, travel and direct investment. Press releases and more detailed quarterly reports from the Balance of Payments Division are also available on the Internet.

Inquiries regarding statistical data produced and published by the OeNB can be addressed to a Statistics Hotline (+43 1 40420 5555), which is available on weekdays from 9 a.m. to 4 p.m.
Since the OeNB has committed itself to following the rules of the Special Data Dissemination Standards (SDDS), release dates are published in advance.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

In January 1998 (reporting date) the OeNB started to provide the EMI/ECB with aggregated b.o.p. data according to the EMI document entitled “Statistical requirements for Stage Three of Monetary Union – Implementation Package”. National monthly data are published six weeks after the reference period. Since the most serious timeliness problems relate to trade in goods statistics, current account data are available on a settlement basis. Data for trade credits are not available on a monthly basis, but are available on a quarterly basis.

The OeNB has decided to reduce the number of items in the breakdown of the monthly b.o.p. due to the timeliness of six weeks which is required by the ECB. Therefore, the checking procedures will be reduced for monthly data but will be expanded for quarterly revised data. The OeNB compiles a country-by-country geographical breakdown with the same timeliness as the aggregate figures, which is integrated into the overall data processing work. The OeNB is in a position to provide a euro area/non-euro area split for current account data and to prepare an assets/liabilities euro area/non-euro area breakdown for Stage Three of EMU.

Significant delays in the reporting of respondents, which would require estimates due to a lack of overall coverage of reported data, occur very rarely. No regular estimates or corrections due to respondents’ delays are therefore necessary. Timeliness of respondents’ reports is a smaller problem than that of the correctness of reports. Revisions following inquiries by the compiler, or following corrections sent by respondents themselves, can be substantial. For new respondents, however, there are often substantial delays due to the lead time needed to identify their reporting obligation and the time necessary to initialise continuous reporting.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

Statistics Austria compiles the external trade statistics by collecting customs documents for extra-EU trade statistics and referring to the Intrastat collection system for the intra-EU statistics. However, since the official trade statistics of Statistics Austria are not available within 30 working days, as required, the OeNB is using settlement data for exports and imports derived from its general reporting system. These data are not entirely comparable with official trade statistics. Among other things, the settlement data include services components which cannot be separated from the commodities component.

Settlement figures are always available on time owing to the nature of the general b.o.p. reporting system and no further estimates have to be made to calculate trade in goods figures at the national level. The geographical breakdown, however, is estimated on the basis of the latest available trade statistics for former comparable periods (mainly the same quarter of the previous year). This geographical estimation is carried out according to the consignment principle and delivers data on a country-by-country basis. As far as trade statistics are used, the data apply the “special trade” concept.

The monthly trade in goods data (and the quarterly and annual data) are not seasonally adjusted. Owing to the preliminary nature of the settlement data, c.i.f. to f.o.b. adjustments are not carried out either. C.i.f./f.o.b. adjustments are only made on quarterly and higher levels. The method applied there is to deduct country-by-country the debit of freight transport (settlement data) from the debit of imports (trade in goods data). The extra-Euro 11 c.i.f./
f.o.b. rates were 3.78% for 1999 and 3.64% for 2000. The respective figures for extra-Euro 12 would have been 3.83% and 3.74% for these periods. In 2001 and 2002 the c.i.f./f.o.b. rates for extra-Euro 12 were 4.9%. In 2003 this figure was 5.2%.

As is the case for all the monthly b.o.p. data, monthly trade in goods figures are not revised. All additional information, including the trade statistics of Statistics Austria for the reference periods, is only incorporated into the quarterly data.

Data on trade in goods on a monthly basis, according to the definition given above (on a settlement basis), are available from the reference period January 1992 onwards and have been published by the OeNB since the beginning of 1998.

No special treatment is foreseen for military goods and transactions under special Community programmes for the monthly goods data. Payments for such types of merchandise are included in the settlement data at a national level. Large transactions in connection with such business cases are usually checked for plausibility. Since the geographical breakdown is estimated for the monthly data as a whole, no special actions are taken concerning the above mentioned transactions.

4.2.2 FOR SERVICES
The services sub-account of the monthly b.o.p. comprises all items that are usually also incorporated in the quarterly data. These include financial services which are reported mainly by banks through the settlement system. The only service item not included in the monthly b.o.p. is “services not allocated”, which only exists at a quarterly level as the difference between goods data according to settlements and goods data according to the trade statistics of Statistics Austria.

4.2.3 FOR INVESTMENT INCOME
On a monthly basis, investment income is calculated on an accruals basis for the purposes of the euro area aggregate. Reinvested earnings are included for the monthly direct investment income data sent to the ECB. Monthly portfolio investment income has been based on accruals calculations since January 2002. This does not apply to the corresponding monthly data published in Austria. The Balance of Payments Division is of the opinion that monthly data should represent pure cash data and that the inclusion of reinvested earnings and accruals leads to a bias in the data.

The flows are settlement data taken from the general reporting system, which also provides a country-by-country geographical breakdown for all components. These data are always available on time.

For portfolio investment income, the monthly flows represent actual dividend payments recorded in the reference period and accruals for debt securities calculated from monthly stocks according to the methods described in Section 5.1.3. No estimations are necessary for this area. A geographical allocation (country-by-country) according to the issuer principle (actual counterpart) is automatically derived on the credit side of portfolio investment income by using a comprehensive securities database. All securities transactions are reported with the ISIN number of the respective security. If a security does not have an ISIN number, the reporting agent can use an “internal” number and give additional details on the security (type of security, quotation, interest rate, etc.) in a special report. The connection with the securities database and a companies database delivers the country of the issuer of the security for the reported credit transaction. On the debit side the country of settlement is used for the geographical allocation of portfolio investment transactions. Essentially, the same geographical allocation methods are used for portfolio investment income on a quarterly and annual basis.

Direct investment income is calculated according to the accruals principle since it includes estimates of reinvested earnings.
These estimates are derived from the annual surveys of direct investment (mainly balance sheet data of direct investment companies), from flows (dividend payments) taken from the settlement system and from the latest available information concerning general economic indicators and profit and business expectations of enterprises. The estimates include a country-by-country geographical breakdown. The same data are also used for quarterly direct investment income.

The monthly investment income data can be broken down into the same sub-components as the corresponding quarterly data. Portfolio investment income and offsetting entries in the financial account on an accruals basis are basically calculated on a monthly basis. However, this is only done in the course of the compilation of quarterly data and the final result is only available as a quarterly figure.

### 4.2.4 FOR DIRECT INVESTMENT

The offsetting entries for the estimates of reinvested earnings (see investment income above) are included.

### 4.2.5 FOR PORTFOLIO INVESTMENT

Data for portfolio investment are settlement data collected on a security-by-security basis in the context of the general reporting system. No other statistics are used to compile the data. The geographical allocation by issuer on the assets side is derived in the same way as for portfolio investment income credits (see investment income above). On the liabilities side, the country of settlement is available as a geographical allocation, except for the counter-entry of the accruals calculated.

### 4.2.6 FOR FINANCIAL DERIVATIVES

No estimation methods for monthly data.

### 4.2.7 FOR OTHER INVESTMENT

Trade credits are not included in the monthly b.o.p., because only quarterly information is available.

There are no further estimation methods or other specific features for the remaining items of the monthly b.o.p.

### 5 INVESTMENT INCOME

#### 5.1 SPECIFIC FEATURES OF DATA COLLECTION

##### 5.1.1 GENERAL

All the data used for investment income are essentially part of the general reporting system (see Sub-sections 3.1 and 3.2). Dividends are recorded as of the date they are paid. In order to obtain data on an accruals basis and with the desired geographical allocation, several special features have been implemented for direct investment income and portfolio investment income.

Concerning the estimation of reinvested earnings for direct investment income and the geographical allocation of portfolio investment income (i.e. actual counterpart for credits and country of settlement for debits), all the descriptions given for monthly b.o.p. in Sub-section 4.2 also hold true for quarterly and annual data.

##### 5.1.2 INCOME ON DIRECT INVESTMENT

See Sub-section 5.1.1.

##### 5.1.3 INCOME ON PORTFOLIO INVESTMENT

Portfolio investment income on an accruals basis is calculated on a security-by-security basis using the monthly security stock reports and a securities database which includes all the relevant information, such as exchange rates of currencies, issuers, quotations, maturities, nominal values, outstanding amounts, interest rates and classification of the securities. Issuance and redemption prices are considered in the accruals calculation in order to also treat zero bonds and deep discounted papers correctly. The accruals calculation is based on monthly data. The result of the accruals calculation cannot be considered an estimated value, since it is based on in-depth calculations and reported data. Revisions only occur when
the underlying stock and securities data are revised or updated. For more information on the use of the securities database, please refer to Sub-section 8.1.

A sectoral breakdown for the offsetting entries of accruals in portfolio investment (financial account) is derived from a companies database which includes information about the sector of the issuer of a security. This information is automatically processed in the security-by-security collection and calculation.

Income earned by collective investment institution (CIIs) on their cross-border assets is recorded just like other portfolio investment income, i.e. dividends when they are payable and interest on an accruals basis. Income earned by holders of the CIIs’ equity capital is treated on an accruals basis. Unlike other accruals calculations, this is not implemented as an automated security-by-security approach, but as a yearly estimate. This estimation is based on the following variables: resident holdings of non-resident CIIs, non-resident holdings of resident CIIs, the cash distribution of income of these institutions, the rates of return of these institutions and assumptions about the degree of capitalisation of and the distribution of income by these institutions.

5.1.4 INCOME ON OTHER INVESTMENT
See Sub-section 5.1.1.

5.2 DEFINITIONS
In principle, the OeNB intends to follow the recommendations of the BPM5 and the harmonisation proposals agreed upon by the ECB’s Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks).

The following geographical allocation principles are used in the area of investment income:

– actual counterpart for portfolio investment credits and for direct investment credits and debits;

– country of settlement for portfolio investment debits and for other investment credits and debits.

A complete geographical breakdown (country-by-country) is achieved by using these principles both for monthly and for quarterly data.

The accruals principle for portfolio investment income has only been applied to quarterly and annual data from the first quarter of 1997 onwards. Since January 2002, the accruals principle has also been used for the monthly contributions to the euro area aggregate. In monthly publications at the national level, however, figures are still given on a pure cash basis. Income on equity is derived from the general reporting system and does not need any further special processing. It also includes income on investment in collective investment institutions (CIIs) on an accruals basis. Income on bonds and notes and on money market instruments is calculated, entirely on an accruals basis, from stocks (see Sub-section 5.1). The securities database used in this calculation comprises all kinds of securities, with the necessary information for every security. Average stocks in the periods under consideration are used for the accruals calculations. This is based on the assumption that securities are bought or sold, on average, in the middle of the period.

Reinvested earnings are included in monthly and quarterly/annual direct investment income data from 1992 onwards. The monthly data on reinvested earnings are exclusively compiled for the purposes of the ECB. Estimates of reinvested earnings are usually revised at least twice for quarterly/annual data, on the basis of the latest available information from direct investment surveys and other sources of data (see Sub-section 4.2). Once the final direct investment survey for the reference year is completed (usually at T + 18 months), the corresponding figures for reinvested earnings are also considered to be final. These data are
then published in the course of the regular revisions at T + 21 months at the latest.

Direct investment income on debt can also be automatically identified by connecting information from reported flows (foreign/Austrian counterparts of the interest transactions) with the companies database which includes information about direct investment relationships. Indirect relationships between direct investment enterprises are not included at present and interest on loans between these indirectly affiliated enterprises cannot be distinguished from other interest payments.

Other investment income mainly comprises income from deposits, loans between non-affiliated enterprises and other capital (i.e. arrears, real estate, etc.) both from banks and from non-banks. The interest share in financial leasing is also part of other investment income, since financial leasing operations are recorded as loans for which interest payments are always fully covered.

All these other income figures are part of the general reporting system, which also includes reports concerning deposits by non-banks with foreign financial institutions. Payments for such deposits are divided into capital and interest components. Once a year stock data on those deposits are received and reconciled with the reported flows.

Income on trade credits is not recorded within other investment. It is indistinguishably included in settlement figures for exports and imports of goods. However, it is assumed that the amount of interest on trade credits is not significant.

Income generated from reserve assets, as reported by the Accounting Division of the OeNB, is also recorded under other investment income. On a quarterly basis these data are calculated according to the accruals principle.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

Income on debt from indirectly affiliated enterprises is recorded under other investment and not under direct investment income.

5.4 GAPS

There are no gaps concerning investment income data.

5.5 INTENDED HARMONISATION

With the implementation of a new general collection regime as from January 2006, the deviations concerning income on debt from indirectly affiliated enterprises are expected to be resolved.

5.6 ESTIMATION METHODS

No estimation methods are used within the area of investment income. The main sources for all the data are reports from the settlement system of the OeNB. Accruals for portfolio investment are calculated security-by-security on the basis of stock data, using a securities database. Accrual figures cannot therefore be considered to be estimations.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Subsections 3.1 and 3.2).

6.2 DEFINITION

In principle, the OeNB follows the recommendations set out in the BPM5 and the harmonisation proposals agreed upon by the ECB’s Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks).

The distinction between current and capital transfers is laid down in the general reporting...
guidelines of the OeNB, in accordance with the BPM5 definitions. Items such as debt forgiveness, migration and other capital transfers are all reported separately. Therefore private sector capital transfers as well as the acquisition and disposal of non-produced non-financial assets can be clearly identified.

For public sector transfers, the coverage and distinction of capital and current transfers is also partly based on the general reporting system. In addition, information regularly received from the Federal Ministry of Finance is used to record capital transfers vis-à-vis EU institutions. Data on current transfers are also provided by the Federal Ministry of Finance.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

As of January 1998 there are no major deviations.

6.4 GAPS

Migrants’ transfers are generally difficult to capture. Data are only partially available for migrants’ transfers in other sectors and the acquisition/disposal of non-produced non-financial assets. The main problem in the context of migrants’ transfers is the transfer of portfolio deposits in connection with migration. The relevant flows information cannot be supplied by the reporting system on transactions. However, in the course of the reconciliation of flows and stocks of securities, significant cases can be identified and corrected in the flow statistics as well. This is an important improvement compared with previous reporting years.

6.5 INTENDED HARMONISATION

None.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

The inclusion of the collection of data on direct investment flows as an integral part of the general settlement reporting system leads to good coverage and high-quality direct investment data. In addition to settlement data, annual surveys of direct investment stocks and an up-to-date companies database are used to check and clearly identify transactions between affiliates. In order to achieve a correct geographical allocation according to the country of the actual counterpart, the reporting agents are often contacted directly in order to investigate major transactions in the area of direct investment. This quality of coverage in the area of direct investment is available both for monthly and for quarterly data from 1992 onwards. In the event that a change of ownership of a resident company from a non-resident to another non-resident direct investor is revealed from the survey, the change is recorded in the FDI stocks, but usually not in the corresponding b.o.p. flows.

Data on trade credits are obtained from enterprise surveys. It is not possible, however, to identify trade credits between affiliated enterprises.

For direct investment cases settled through an exchange of shares, the transaction is usually recorded when the exchange takes place. Unless a price has explicitly been agreed between the parties involved in the exchange of shares, the share price of the direct investor’s company on the day of the exchange and the exchange relation (e.g. one share of A equals one share of B) are used to value the transaction. The direct investor in this case is usually identified as the “bigger” or “buying” party that has the majority in the newly formed group after the exchange has taken place. If both of the exchanged shares have a market price, then these prices should anyway be considered equal on the day of the exchange. More problematic would be cases where no market prices are available, as in the
case of unquoted shares. This, however, has not yet occurred in Austria.

### 7.2 Definition

In principle, the OeNB complies with the recommendations set out in the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks).

The OeNB applies the 10% criterion and the directional principle to direct participations and has started to develop a mechanism for compiling data on indirect relationships.

Direct investment figures comprise transactions on equity, reinvested earnings and other capital (short and long-term) with the exception of trade credits. Significant equity contributions in the form of real or financial assets without payments are usually included by directly contacting and questioning the enterprises concerned. With regard to the issue of transactions in equity securities, it is possible to distinguish clearly between direct investment and portfolio investment based upon the information in the securities and companies databases. Furthermore, all cross-border transactions in real estate are covered.

Special purpose entities are not subject to a different treatment since they are not significant in Austria.

The geographical breakdown is based on the residency of the actual issuers (i.e. debtor/creditor principle). It is also available for historical data.

### 7.3 Deviations from Agreed Definitions

Problems arise as a result of the separation of trade credits between linked enterprises; trade credits are available as a lump sum on a quarterly basis and are recorded under other investment.

### 7.4 Gaps

None – the implementation of the methodology for reinvested earnings is based on the proposals made by the EMI’s Sub-group on estimation methods for direct investment.

### 7.5 Intended Harmonisation

With the implementation of a new general collection regime as from January 2006, the issue of recording trade credits between affiliates separately from other investment trade credits is expected to be resolved.

### 7.6 Estimation Methods

For information on the estimation of reinvested earnings, see Sub-sections 4.2 and 5.2.

### 8 Portfolio Investment

#### 8.1 Specific Features of Data Collection

A comprehensive and reliable compilation system is used for portfolio investment flows and stocks. The system is based on data collection on a security-by-security basis using the International Securities Identification Number (ISIN). The compilation system was developed during 1988-89 in order to improve the reliability of portfolio investment data. Experience showed that instructions to reporting agents regarding the classification of securities for b.o.p. purposes were proving to be increasingly complicated in fast developing international financial markets. Therefore, the reporting by banks of transactions and of stocks of securities is now based on the ISIN code for each individual security. Austrian banks appreciated this change, since ISIN codes were already used for the settlement of securities transactions. Based on the reported ISIN code in connection with the securities database, all necessary b.o.p. and i.i.p. classifications (by financial instrument, sector, country) and the reconciliation of flows and stocks (see Sub-section 3.2) are made.
This change in the compilation system made it necessary for the OeNB to develop and maintain a securities database. The main external information contained in this so-called master file is purchased from the Austrian and German National Numbering Agencies, i.e. the Oesterreichische Kontrollbank (OeKB) and the German Wertpapiermitteilungen. While the OeKB provides data on domestic securities and euro-denominated foreign securities traded in Austria, the Wertpapiermitteilung primarily delivers data on foreign securities and domestic securities denominated in currencies other than the euro. Moreover, the Austrian banks reporting portfolio stocks and transactions also have to supply information concerning “internal” securities which – to the best of their knowledge – do not have an ISIN code. If information on the same security is received by more than one institution, then the OeKB data are usually given preference. Quotation information is obtained from the Telekurs. These external securities databases form the starting-point for the internal master file constructed for b.o.p. purposes.

The Statistics Department generates an internal master file from these sources and from additional information provided by Austrian banks. The internal master file used by the OeNB for the compilation of portfolio investment flows and stocks contains around 130,000 debt securities, 30,000 financial derivatives and some 100,000 equity securities, thus covering around 99% of the securities traded with Austrian residents on a cross-border basis. Not all the securities in the database are actually involved in cross-border trading. Stocks and transactions are usually reported for approximately 40% of all non-expired securities in the database for a certain period of time. The database is updated on a weekly basis. Comprehensive quality checks and amendments are made by the Balance of Payments Division in order to render the information received from external sources suitable for statistical purposes. These checking procedures comprise formal controls (completeness of information), as well as plausibility checks. The main source of quality problems regarding the information received on securities is the fact that the National Numbering Agencies maintain their databases for their customers (banks), and that the latter use the information for their own business needs, which differ from those of statistical compilers. Therefore data fields which are particularly important for statistical purposes (i.e. outstanding amount) are not always of the desired quality and have to be checked in detail.

As for the compilation of harmonised euro area portfolio investment aggregates, the OeNB is of the opinion that a securities database (master file) for statistical purposes should be generated and maintained centrally for all EU Member States. Owing to the time-consuming quality controls carried out on commercially available information on securities, a centralised checking procedure would be most effective. This centralised database should contain information useful for all statistics required by the ECB and not only those data necessary for b.o.p. purposes. Agreement should be reached on a common definition of the content of such a centralised master file. The main advantages of the ISIN compilation system for portfolio investment flows and stocks are seen in the increased accuracy and the higher degree of flexibility for adapting the compiled aggregates to the new requirements, often without the need to address further requests to the reporting agents.

8.2 DEFINITION

The OeNB mainly applies the recommendations set out in the BPM5 when compiling statistics on portfolio investment. The OeNB is in a position to provide a country-by-country breakdown of portfolio investment.

The use of the securities database allows a geographical allocation of portfolio investment assets according to the country of the actual counterpart (issuer). On the liabilities side, the country of settlement is used for this purpose, because there is no information available on the
real holder of the security. As a consequence, the transactions on the liabilities side are largely attributed to countries where major international clearing houses are resident. The geographical breakdown described is available on a monthly basis from January 1992 onwards. Offsetting entries in portfolio investment for the accruals calculated in investment income are available on a quarterly basis as from the first quarter of 1997, and on a monthly basis (solely for the contribution to the euro area aggregate) as from January 2002 (see Sub-sections 5.1 and 5.2).

The sectoral breakdown of portfolio investment flows is achieved by using information from the securities database and from portfolio stock reports. On the assets side, only the monthly stock reports provide reliable information about the domestic sectoral composition of portfolio investment data for a certain period. Portfolio transactions between domestic sectors are not usually covered by the reporting system for flows, since no cross-border payments are involved. These flows can only be derived from stock data.

Service charges, fees and commissions are not included in portfolio investment if separate payments are made for such components. In most cases, the reporting agents are able to identify and label such payments correctly. If they are indistinguishably included in payments for portfolio investment capital, then no separation is possible.

Trading in assets other than securities (particularly loans) is not recorded under portfolio but under other investment.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

In principle, the OeNB aims to comply with the requirements set out in the BPM5 and the harmonisation proposals agreed upon by the ECB’s Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks).

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

None.

8.6 ESTIMATION METHODS

There are no estimations included in portfolio investment.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Financial derivatives are largely covered by the general reporting system for flows and stocks. It distinguishes between derivative instruments that are issued as securities (with an ISIN code) and other derivative transactions (mainly over-the-counter (OTC) deals).

The former are reported as normal security transactions (and stocks) and are treated in the same way as securities recorded under portfolio investment (see Sub-section 8 for information on the use of a securities database to distinguish portfolio investment from derivatives and to derive a correct geographical and sectoral allocation for financial derivatives, etc.).

The latter, i.e. other derivative transactions, are reported as special items in the context of the settlement system. Reporting agents have to distinguish between financial derivatives with underlying interest and financial derivatives with underlying capital. They are also required to report the country of the actual counterpart and the domestic partner of the derivatives transaction in case this is not the reporting agent itself. This information is used in connection with the companies database to compile a sectoral breakdown.

The geographical breakdown for financial derivatives is based primarily on the country of
the actual counterpart, as reported by the respondents. These counterparts are usually available for OTC-style derivatives. In the case of trading on organised markets, especially in that for negotiable financial derivatives with ISIN-codes, the country of the first-known counterpart is available. The latter is usually identical to the market where the instrument has been traded.

9.2 DEFINITIONS

The recommendations set out in the BPM5 and the proposals of the Working Group on Balance of Payments and External Reserves Statistics (the former Task Force on Financial Flows and Stocks) are followed, apart from the exceptions mentioned in Sub-section 9.3.

For interest rate swaps, all three payments are usually recorded: the actual interest payment and both swap payments with the country of the foreign swap partner. Fees and commissions in connection with financial derivatives can be identified separately and are recorded under financial services. Initial margin payments for options and futures are recorded under other capital. Variation margins are recorded as financial derivatives. It is not possible to make the distinction between options-style and futures-style variation margins.

A geographical breakdown according to the country of the actual counterpart as well as a sectoral breakdown are available on a monthly basis. For financial derivatives without an ISIN code, the sectoral breakdown may not be totally reliable where the domestic swap partner cannot be identified correctly. The following distinctions between instruments are possible: swaps of domestic bonds and notes (currency and interest rate swaps), OTC deals, financial derivatives with an ISIN code. These categories can be subdivided further into derivatives with underlying interest and derivatives with underlying capital.

Data are available on a gross basis where the financial derivatives have been issued as securities and have ISIN codes. In these cases financial derivatives with domestic issuers are considered to be liabilities and securities with foreign issuers are considered to be assets. For derivatives without ISIN codes (mainly OTC deals), only net figures are recorded and these are allocated to the assets/credit side by default.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

All deviations concerning the treatment of financial derivatives have been removed with the beginning of the year 2000. Consistent historical data back to 1992 are also available.

9.4 GAPS

Coverage of financial derivatives can be considered complete as from the beginning of 1997. Currency and interest rate swaps, which are thought to be the only significant kinds of transactions in this context, are, in particular, very well covered.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

No estimation methods are used in the field of financial derivatives.

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

These items are part of the general reporting system (see Sub-sections 3.1 and 3.2). Recorded actual flows are used for the b.o.p. These flows are extensively checked and reconciled with stocks.

All required geographical, sectoral, maturity and instrumental breakdowns are available on a monthly basis. This also applies to back data from January 1999 onwards. For the most part, the breakdowns are derived directly from the
reports. Some sectoral breakdowns are achieved by linking the reported data (including those on the domestic counterpart) to a company database.

For trade credits, quarterly and annual surveys are conducted. Trade credits are therefore not available on a monthly basis. Initial quarterly figures are often revised once the more comprehensive annual survey is concluded. The latter is usually available within six to nine months after the end of the year. The outcome of this annual survey is then incorporated in the next scheduled revision of published data. Owing to the nature of the surveys, the timing principle for trade credits is the change of ownership. No maturity breakdown is available for trade credits.

Transactions carried out through the TARGET payment system are reported according to the guidelines of the general reporting system (particularly the Devisentableaumeldungen), which also provides the basic rules for the reporting of payments carried out through all kinds of clearing or payment systems (i.e. EBA, TARGET, etc.). Due to the nature of every clearing or payment system (i.e. carrying out payments indirectly through a system or a paying agent), a substantial proportion of the TARGET transactions is consequently reported with neutral codes. If necessary, the resident bank that ordered or received the payment (on their own behalf or on behalf of their customers) is obliged to give detailed information on the economic nature of the settlement via a supplementary report.

10.2 DEFINITION

The OeNB generally applies the recommendations set out in the BPM5.

Other investment figures also include foreign currency notes, financial leasing, bond lending and repos. Concerning repos, there is no detailed information available on the nature or maturity of such transactions. In addition, it is not possible to distinguish between repo activities and collateralised loans.

Short and long-term loans between affiliated enterprises can be identified and are recorded under direct investment according to the directional principle.

Trading of loan portfolios is recorded under other investment, although the amounts in question have not been significant in recent years.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

All trade credits are included under other investment (see Sub-section 7 on direct investment).

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

With the implementation of a new general collection regime as from January 2006, the issue of recording trade credits between affiliates separately from other investment trade credits is expected to be resolved.

10.6 ESTIMATION METHODS

Trade credits are estimations based on quarterly (smaller sample) and annual (larger sample) surveys. Initial quarterly results can be considered to be estimations. The results of the annual survey are considered to be the final outcome for the reference year.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Part of the general reporting system (see Sub-sections 3.1 and 3.2). The Accounting Department of the OeNB essentially makes the same reports as the banking sector. These are
used for all parts of the b.o.p. on a monthly level. Special quarterly reports on stocks and flows are received to enable recording on an accruals basis and to improve the breakdown of reserve assets. The regular monthly and special quarterly reports are both incorporated in the quarterly b.o.p. The quarterly data only cover the area of reserve assets.

11.2 DEFINITION

In principle, the recommendations of the BPM5 are applied for the recording of reserve assets. A reliable instrumental breakdown is available on a quarterly basis. Experience has shown that such a breakdown is not always possible on a monthly level with a 30-day time-lag.

Financial derivatives within reserve assets are available on a gross basis; however, very few transactions have yet been recorded. Gold swaps are recorded as repos.

Market prices are used for valuation. The conversion into euro is carried out using average monthly exchange rates.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Data for the i.i.p. are collected within the general reporting system (see Sub-sections 3.1 and 3.2). The securities database is used for portfolio investment stock data in the same way as for portfolio investment flows (geographical, sectoral and instrumental allocation on a security-by-security basis, see Sub-section 8.1). The coverage and concept are in line with the quarterly/annual b.o.p./i.i.p. position of the financial account.

Pure stock data are used for portfolio investment stocks and reserve assets. A combination of stocks and accumulated flows is used for other investment (approximately 90% pure stocks data). The stock data for other investment is mainly derived from the settlement system with the exception of trade credits, which are based on quarterly and annual surveys.

Financial derivatives are also a combination of stocks and accumulated flows (approximately 20% pure stock data).

In the case of direct investment, stocks of real estate are exclusively compiled by using accumulated flows (approximately 5% on the assets side and 3% on the liabilities side of overall assets and liabilities of direct investment stocks, respectively). Additionally, since the final results of direct investment surveys only become available after 18 months, accumulated flows are used for the provisional version of direct investment stocks available after six to nine months. This provisional version is compiled as the sum of the stock data of the previous reference year plus the accumulated flows (including reinvested earnings) of the reference year. For the final version of direct investment stocks (published at T + 21 months), the pure stock data from the survey (also including reinvested earnings) are used.

The required sectoral and instrumental breakdowns are covered by the collection system for all parts of the i.i.p. from the reference year 1997 onwards.

A geographical allocation between euro area and non-euro area data is possible to a substantial extent. Essentially, geographical data are collected on a country-by-country
basis. However, the geographical breakdown will be of lesser quality or not available at all in the following areas:

- trade credits within other investment;
- accumulated flows (for the most part) used for other investment stocks;
- real estate within direct investment; and
- portfolio investment liabilities.

Austria participated in the Co-ordinated Portfolio Investment Survey of the IMF for 2002, providing all the mandatory items and most encouraged items (currency and sectoral breakdown). The data requested for this survey could be compiled regularly on a quarterly basis with a timeliness of T + 6 months. Pure stock data would be used for this task.

The data for the i.i.p. can be made available quarterly. Technically these data are calculated automatically with a time-lag of three months. However, the procedures for checking and correcting data which are necessary to achieve a quality comparable to annual data would take at least six months.

12.2 DEFINITIONS

12.2.1 GENERAL

The recommendations and definitions set out in the BPM5 are applied in the compilation of the i.i.p.

12.2.2 DIRECT INVESTMENT

The directional principle is strictly applied in the area of direct investment stocks. Reinvested earnings also form part of the stock data. Reconciliation adjustments between flows and stocks pose a problem for direct investment in particular, because book values are primarily used for stocks and market values for flows. Therefore, other adjustments (in the sense of residual adjustments) can be very high. Price adjustments and other adjustments (in the sense of reclassifications) can be identified to a limited extent. Exchange rate adjustments are calculated on the basis of average monthly exchange rates for transactions and end-of-month exchange rates for stocks.

To the extent that accumulated flows are used (real estate and remaining provisional data after six months), market valuation can be largely assumed for direct investment stocks. As soon as final results of surveys are available (T + 18 months), only book values are used for direct investment in the i.i.p., with the exception of real estate components. Market valuation for direct investment stocks based on an “earning-method estimation” is compiled for a separate statistical publication, but these figures cannot be used for the i.i.p.

12.2.3 PORTFOLIO INVESTMENT

Stock data on portfolio investment include accruals (calculated on a security-by-security basis). In that context, it is important to note that interest rate components derived from discount prices and redemption at higher prices are included in the accruals calculation and therefore in the stocks. This mechanism was especially designed for zero-coupon bonds, but it also works for all other kinds of short and long-term securities.

Stocks and flows are closely reconciled. Exchange rate and price adjustments are calculated security-by-security, using information from the securities database (mainly quotations and exchange rates). Other adjustments (sectoral and instrumental reclassifications) are also identified automatically in this context. The remaining differences are calculated as residual adjustments. Portfolio investment stocks are valued at market prices.

On the liabilities side of portfolio investment stocks, no geographical information is available (as opposed to flows, where the country of settlement can be used for geographical allocation). On the assets side, portfolio investment stocks can be allocated geographically according to the debtor principle, using the securities database (see Sub-section 8.1).

12.2.4 FINANCIAL DERIVATIVES

Financial derivatives stocks mainly comprise accumulated flows which largely consist of OTC-style derivatives. For these instruments, no clear valuation principle can be identified,
but the result should be close to market values. Remaining financial derivatives stocks are based on pure stocks of derivative securities with ISIN codes. These stocks are highly reliable and are calculated at market prices. No other kinds of financial derivatives are included in the stock data. The stocks are mainly attributed to the asset side by default, since there are no fully reliable stock data available on a gross basis. The amounts of financial derivative stocks that can be derived for the above-mentioned instruments are usually not significant.

12.2.5 OTHER INVESTMENT
As described in Sub-section 3.1, flows and stocks for accounts relevant for other investment are combined in one report and therefore have to be reconciled by the reporting agents (in the original currency). Price adjustments (mainly relating to asset trading), other adjustments (reclassifications) and residual adjustments (reporting errors or stock corrections) can be taken directly from the reports. Exchange rate adjustments are calculated using average monthly exchange rates for transactions and for reported adjustments, and end-of-month exchange rates for stocks. The same adjustment calculations can be made for accumulated flows within other investment. Other investment assets and liabilities are based on nominal values.

12.2.6 RESERVE ASSETS
Reserve assets are directly reported by the Accounting Department of the OeNB in the form of special quarterly reports. These reports comprise stocks, transactions and all kinds of adjustments. The data are taken directly from the accounting database. Stocks and transactions of currency and deposits within reserve assets are not included in the special quarterly reports since they are already covered by the regular monthly reports which are carried out according to the guidelines of the general reporting system. Discrepancies between accounting principles and b.o.p./i.i.p. concepts are seen as being insignificant. The valuation is executed according to market values using closing market prices for gold and closing mid-market exchange rates.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
The treatment of trade credits deviates from requested definitions, because trade credits between affiliated enterprises are included in other investment.

12.4 GAPS
Gaps exist in the area of financial derivatives, which are only partly available.

12.5 INTENDED HARMONISATION
None.

12.6 ESTIMATION METHODS
Accumulation of flows is used in the area of direct investment to obtain provisional stock data after six to nine months and to obtain stock data on real estate. Accumulated flows are also used to a small extent in other investment for loans and other assets/liabilities which are below the thresholds for direct reporting.

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

_**Narodowy Bank Polski (NBP)**_ is responsible for compiling and publishing Poland’s balance of payments (b.o.p.) and related statistics (e.g. the international investment position (i.i.p.), external debt, foreign direct investment (FDI) statistics, reserve assets).

Narodowy Bank Polski is the central bank of the Republic of Poland. In line with its statute, the basic objective of the NBP’s activity is to maintain price stability and to strengthen Poland’s currency. This objective is pursued by:

- developing and implementing monetary policy;
- creating the institutional basis for ensuring the requisite level of financial safety and stability within the banking sector; and
- regulating the relevant principles and mechanisms for guaranteeing the liquidity of monetary settlements within the economy.

Under the Constitution of the Republic of Poland of 2 April 1997 (Article 227), Narodowy Bank Polski is the central bank of the State and has the exclusive right to issue legal tender as well as to develop and pursue monetary policy.

Responsibility for b.o.p. and related statistics lies with the Department of Statistics of Narodowy Bank Polski.

The tasks performed involve:

(i) maintaining statistical records on the basis of bank and non-bank reports (including collaboration with NBP regional branches in collecting and analysing the statistical data required);

(ii) developing instructions and guidelines for, and providing ongoing guidance to, banks and other parties compiling statistical reports;

(iii) conducting monthly analyses of movements and developments impacting particular items of b.o.p. and other related statistical statements,

(iv) conducting methodological studies regarding the b.o.p. and related statistics,

(v) preparing and publishing data on b.o.p. and related statistics,

(vi) cooperating with domestic and foreign institutions in work on b.o.p. and related statistics.

2.2 LEGISLATIVE PROVISIONS

In cases of non-compliance with legal requirements, sanctions are imposed on non-reporting agents in the form of a fine that is regulated by the Penal and Fiscal Code (Kodeks Karny Skarbowy), as published in the Journal of Laws of 1999, No 83, Item 930.

2.3 INTERNAL ORGANISATION

Within the Statistics Department of Narodowy Bank Polski, three divisions are in charge of the methodology, compilation, publication and analysis of b.o.p and related statistics. These
are the Balance of Payments Compilation Division, the Balance of Payments Statistics Division (responsible for data collection) and the Portfolio Investment Statistics Section. There is also an expert for b.o.p. current account statistics.

The staff of NBP’s regional branches are also involved in b.o.p. data collection and control.

2.4 EXTERNAL COOPERATION

Narodowy Bank Polski cooperates with domestic organisations (mainly the Central Statistical Office (CSO) and the Ministry of Finance (MoF)) and foreign institutions in the exchange of data and other tasks related to b.o.p. statistics.

Several institutions provide Narodowy Bank Polski with additional information on certain b.o.p. items. The CSO, as a result of cooperation on the methodology of statistical research, supplies trade figures corresponding to turnover for the goods item of the b.o.p. The CSO uses NBP data for the production of national accounts, in particular data on income, current transfers and services for the compilation of the account for the rest of the world (ROW). The CSO also supplies the data on non-resident holdings of Polish securities registered on securities accounts with Polish brokerage houses and the information necessary to maintain a b.o.p. business register.

The Institute of Tourism (IoT) provides data for the travel item.

The Commission of Securities and Stock Exchanges (CSSE) supplies data on major non-resident shareholders in Polish public companies.

The MoF supplies data on external transactions of the government sector.

Furthermore, Narodowy Bank Polski is cooperating with EU institutions (the ECB and Eurostat) and international organisations (the International Monetary Fund (IMF), the Organisation for Economic Co-operation and Development (OECD) and the World Bank) regarding the b.o.p. methodology and reporting.

2.5 USERS

Data on the b.o.p., the i.i.p., the external debt, the official reserve assets, the international reserves and foreign currency liquidity are posted on the NBP’s website and are thus made available to all users.

Moreover, data and publications are forwarded to Parliament, the Government, the CSO and to private and public research institutes, universities, rating agencies, etc.

B.o.p., i.i.p. and direct investment statistics are supplied to the ECB, the European Commission (Eurostat), the IMF, the OECD and the World Bank on a regular basis.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The Polish b.o.p. compilation system is mixed. Settlement data are supplemented by data from surveys of enterprises and public statistics (CSO and Institute of Tourism).

One of the most important information sources for b.o.p. data collection purposes is payments recorded by the Polish banks. The settlements include transactions made by the banks on their own account and on behalf of their clients. It is a closed system, i.e. all changes in the level of external accounts are explained. The balance on the external accounts at the beginning of the period plus transactions during the period equals the balance at the end of the period.

The settlements system provides data for the compilation of the b.o.p. with detailed instrument/category and sector breakdowns. The reports include the reporting of all credit and debit transactions and country breakdowns.
The system for the quarterly b.o.p. incorporates data from the banks, as well as data derived from surveys of enterprises and other entities for goods, services, income, FDI, trade credits and loans. It also includes transactions on accounts held by Polish residents with banks abroad. In general, it is a full-coverage system with a limited application of exemption and simplification thresholds. The system provides for the compilation of the b.o.p. with a detailed item-by-item breakdown. Credit and debit entries are available for all items. Data on trade credit flows are derived from pure stock data. For portfolio investment, settlement data are used.

The geographical breakdown is available for data since 2004.

Flow data are reconciled with stocks. Other sources, such as securities databases, the internet and the press, are used for cross-checking.

In the case of the monthly b.o.p., estimates of key items are made. These estimates are based on the interpolation of the quarterly b.o.p. data using monthly settlement statistics and additional available sources.

3.2 REPORTING AGENTS

(i) Banks:
- self-balancing monthly reports on stocks and flows on current accounts (vostro and nostro);
- self-balancing quarterly reports on foreign borrowing/lending;
- self-balancing monthly reports on foreign currency cash transactions;
- monthly reports on assets/liabilities positions;
- individual reports of Polish banks issuing securities on foreign markets;
- quarterly reports on holdings of securities issued by non-residents;
- monthly reports on non-resident holdings of Polish securities issued by entities other than the Treasury and registered on custody accounts;
- annual reports of enterprises with foreign participations on FDI to Poland; and
- annual reports on Polish direct investment abroad.

(ii) Enterprises and individuals:
- self-balancing quarterly reports on stocks and flows on accounts with banks abroad;
- self-balancing quarterly reports on stocks and flows of foreign lending/borrowing;
- annual reports of enterprises with foreign participation on FDI to Poland;
- annual reports on Polish direct investment abroad;
- quarterly reports on trade credits;
- quarterly reports on netting;
- individual reports of Polish non-bank companies issuing securities on foreign markets;
- monthly reports on non-resident holdings of Polish securities issued by entities other than the Treasury, registered on custody accounts;
- quarterly (for financial institutions other than banks) and annual (for non-financial institutions) reports on residents’ holdings of securities issued by non-residents;
- monthly reports on non-resident holdings of Polish securities issued by non-residents; and
- reports on real estate transactions of individuals with non-residents.

(iv) CSO: supplies trade figures corresponding to turnover of goods for the goods item;

</table>
(v) **IoT**: provides data for the travel item;

(vi) **MoF**: reports data on the external transactions of the government sector, local government transactions and non-resident holdings of Treasury securities.

(vii) **Commission of Securities and Stock Exchanges (CSSE)**: annual reports on major non-resident shareholders in Polish public companies (shareholdings of over 5%).

### 3.3 THRESHOLDS

For settlements provided by banks, the €12 500 threshold is applied for all transactions. Below this value, transactions are reported but are not given an individual code (i.e. the nature of the transaction is not specified) and the resident ordering customer/beneficiary is not identified.

**Exemption thresholds**: for trade credits, data are supplied for stocks above €100,000 at the quarter end. For foreign lending/borrowing by enterprises, a threshold of €10,000 is applied. In the case of compensation, the obligation to provide statistical data arises when quarterly turnover on compensation exceeds €100,000. Above the threshold of €10,000, real estate transactions made by individuals require statistical reporting. In FDI statistics, there is a reporting obligation when the stock value of foreign direct investment in Poland exceeds €25,000. In the case of Polish direct investment abroad, a threshold of €10,000 is applied.

With regard to portfolio assets held by non-financial entities, the obligation to report statistical data arises when the total value of foreign securities held at the end of the year exceeds €10,000. A threshold of the same value is applied to Polish non-financial entities’ holdings of securities issued by Polish residents on foreign markets. For financial derivatives, a threshold of €100,000 is applied to the value of the underlying instrument (potential claims or liabilities vis-à-vis non-residents resulting from the total position in financial derivatives held by Polish end-investors). This threshold is not applicable to Polish intermediaries.

**Simplification thresholds**: for foreign lending/borrowing by enterprises of an amount above €10,000 but less than €1,000,000, a simplified form is applied.

### 3.4 AVAILABILITY OF DATA

The monthly b.o.p. is published 40 working days after the end of the reference period. Since 2003, the b.o.p. has been compiled quarterly and distributed three months after the reference quarter. The series of monthly and quarterly data are available as from 2000.

An advance release calendar, providing the precise release dates one quarter ahead, is available on the NBP’s website (http://www.nbp.pl). A note to this effect is published in “Preliminary Information”.

The information posted on the website is in the form of limited breakdowns into key items.

The quarterly b.o.p. is available with detailed instrument/category and sector breakdowns. Currency and country breakdowns are available for selected items. The breakdowns posted on the website are limited in detail.

### 3.5 DATA CONTROLS

At the level of individual information, the data are checked for errors by means of an automatic procedure for the data sent by file transfer and on a PC for data sent in paper form.

The data are also controlled at an aggregated level for validation of classification errors as well as for an evaluation of time series for specific items.

Flow data are reconciled with relevant stocks.

Data derived directly from enterprises’ reports and information derived from banks’ reports on
enterprises’ transactions are cross-checked before being published.

The data are cross-checked with other sources, e.g. information on relevant stocks from b.o.p and monetary statistics, securities databases, the internet, the press, commercial data providers, data on privatisations, etc.

3.6 REVISION POLICY

Quarterly b.o.p. data:

– first revision when the data of the following quarter become available;
– next revision when forth quarter is available (end-March);
– further revisions, yearly when the data referring to corresponding annual i.i.p. become available or are revised (end-September).

Monthly b.o.p. data:

– first revision when the data of the following month become available;
– further revisions when the data referring to the corresponding quarterly b.o.p. become available or are revised.

3.7 DISSEMINATION

The data on the b.o.p., the i.i.p., the external debt, the official reserve assets, the international reserves and foreign currency liquidity are released simultaneously to all interested parties by posting them on the NBP’s website (http://www.nbp.pl). Publication schedules are posted on the website in advance.

More detailed data on the b.o.p., i.i.p., external debt, reserve assets, direct investment, etc. are published in separate publications at quarterly/annual intervals. Only Polish versions are disseminated. The titles of the publications are:

– Bilans płatniczy Rzeczypospolitej Polskiej (“Balance of Payments of the Republic of Poland”) – on a quarterly basis;
– Zagraniczne inwestycje bezpośrednie w Polsce (“Foreign Direct Investment in Poland”) – on an annual basis;
– Polskie inwestycje bezpośrednie za granicą (“Polish Direct Investment Abroad”) – on an annual basis.

The titles of other publications (both in Polish and in English) produced by Narodowy Bank Polski that include information on b.o.p. statistics are:

– “Preliminary Information” – on a monthly basis;
– “Information Bulletin” – on a monthly basis; and
– “NBP’s Annual Report” – on an annual basis.

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

The main source of data on goods for the b.o.p. is the foreign trade statistics (FTS) compiled by the CSO on the basis of customs statistics (data from the Single Administrative Document, SAD). From May 2004, the data on foreign trade with European Union countries will be received from Intrastat declarations.

Data from the customs statistics are adjusted and converted in line with the definitions and methodology of the BPM5, including a c.i.f/f.o.b. adjustment and reclassification of services registered in the FTS as goods. Additional estimates are made for foreign trade flows not recorded by the customs statistics. Estimates of shuttle trade are derived in consultation with the CSO. The CSO provides information from the national accounts balancing procedure of GDP and the two institutions (CSO and NBP) agree on the value of exports and imports through shuttle trade missed in the customs statistics.

</table>

1) The data are temporarily published 40 days after the end of the reference period.
2) Assets net of liabilities.
4.2 DEFINITION

The goods item of the b.o.p. covers general merchandise, goods for processing, repairs on goods, goods procured in ports by carriers and non-monetary gold. Data on exports and imports are presented on a f.o.b. basis.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

Data on goods for processing are computed by the FTS from SAD documents on the basis of custom procedures’ codes, the same as used by Eurostat, but we realise that for some transactions recorded as goods for processing the legal change of ownership may take place.

Data for reclassification from goods to services, for part of these processed goods, which after processing are sent to a third country, are not available.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

When compiling monthly data, estimates are made using FTS and payments data.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on services are based on settlements made through the banking system. Those data are supplemented with information derived from surveys of enterprises’ transactions in services with non-residents. The travel item is compiled using Institute of Tourism data. The detailed breakdown of services is consistent with BPM5 recommendations.

(i) Transportation

Data provided by the banking system on payments and by the surveys on enterprises for transportation services include services broken down by the mode of transport and by passenger, freight and other forms of transportation. The geographical breakdown for those data is available. Data received from the c.i.f./f.o.b. adjustment of the goods item are also included in freight transportation services. The value of these services is compiled as a fixed rate of the value of goods imports in the foreign trade statistics. The geographical breakdown is available in the FTS.

(ii) Travel

The b.o.p. travel item is compiled using data of the Institute of Tourism, which come from surveys. Narodowy Bank Polski receives data on amounts of travellers’ expenditures: foreigners in Poland and Poles abroad. Since 2004 those data are provided to the b.o.p compilers quarterly with the required geographical breakdown. When compiling monthly data, estimates are made using information of the Border Guard (on numbers of arrivals and departures) and payments data (including settlements on travel items recorded in the banking system and also purchases and sales of foreign banknotes).

(iii) Other services

Monthly settlement data are supplemented quarterly with data from surveys of enterprises.

5.2 DEFINITION

Definitions and the detailed breakdown of services are generally in line with the requirements of the BPM5. Insurance services are calculated as a net balance of gross premiums paid and gross claims received.
5.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
None.

5.6 ESTIMATION METHODS
Monthly data are estimated (see Sub-section 5.1).

6 INCOME
6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES
Compensation of resident employees comprises wages, salaries and other benefits in cash, earned by individuals, paid by non-resident employers and transferred to Poland. Compensation of non-resident employees comprises wages, salaries and other benefits in cash, earned by individuals, paid by resident employers and transferred abroad. The data are derived from banking statistics.

6.1.2 INCOME ON DIRECT INVESTMENT
In the monthly and quarterly b.o.p., income on direct investment, for both inward and outward investment, includes interest on equity (e.g. dividends and remittances of branch profits) and on debt.

The data on inter-company loans are collected from direct investors (for outward investment) and direct investment enterprises (for inward investment) in quarterly surveys. The data on dividends and bonds and money market instruments are recorded on a cash basis. Interest on inter-company loans is recorded for both directly and indirectly owned enterprises at the date on which it is due for payment. Capitalised interest is offset on a directional basis under other capital. The data on interest on trade credits are not calculated because they are negligible. The information on income on equity is supplemented through the annual survey.

Dividends and distributed branch earnings are recorded when payable, and reinvested earnings as well as undistributed profits are recorded in the period in which they are earned.

Reinvested earnings are calculated as profits earned (collected on an all-inclusive basis) during the period less dividends payable. The Fully Consolidated System is not applied: reinvested earnings are counted for directly-owned enterprises only. Since 1996, direct investors’ shares of losses have been introduced as negative reinvested earnings. The flows equal to reinvested earnings are recorded as additional equity capital in the financial account.

Data are broken down by country, region, economic zone and economic activity. The income is allocated to the countries as a result of the debtor/creditor principle of foreign assets and liabilities.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
Data on portfolio investment income are derived from settlements made by banks. The information is available in a breakdown by instrument (equity, bonds and notes, money market instruments). For income on equity securities, only dividends are registered as income on portfolio investment; other gains (or losses) on equity securities are classified under portfolio investment in the financial account.

6.1.4 INCOME ON OTHER INVESTMENT
Interest is recorded on a settlement or due-for-payment basis.

Income from other investment includes interest on credits extended and received and interest on bank account deposits and repos. Interest flows
on loans, deposits, etc. are provided by banks engaged in foreign exchange operations abroad.

The settlement data are supplemented by interest on loans unrecorded by the banks, and interest received on deposits of non-banking institutions held with banks abroad.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
The data on investment income are not recorded on an accruals basis.

6.3 GAPS
Reinvested earnings are not covered in the monthly and quarterly b.o.p.

6.4 INTENDED HARMONISATION
The security-by-security portfolio investment data compilation system is under construction. The new system will provide for the separation of debt security transactions into principal and accrued interest and, as a result, for the correct classification of accrued interest as income on portfolio investment. There is also a plan to introduce the accruals principle for other investment income.

6.5 ESTIMATION METHODS
None.

7 CURRENT TRANSFERS
Current transfers data are mainly compiled on the basis of settlements. The classification of current transfers on items, required by the BPM5, is made using transaction codes of banking settlements. Current transfers are broken down in the b.o.p. into governmental and other sectors, in which workers’ remittances and other transfers are recorded separately. For estimates of workers’ remittances, the information on cash transactions through banks’ bureaux de change is used as an additional source. These estimates are made on a net basis.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION
The settlement data are supplemented with information on debt forgiveness and grants in kind.

8.2 DEFINITION
The capital account covers capital transfers that include donations and grants to finance fixed assets, debt forgiveness, the acquisition/disposal of non-produced, non-financial assets and migrants’ transfers.

8.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

8.4 GAPS
None.

8.5 INTENDED HARMONISATION
None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION
The monthly data on foreign direct investment are derived from the flows of international
payments reported by the domestic banking sector and supplemented through estimation of other capital. The data are broken down into equity and inter-company loans. Equity contributions without payment are not covered.

On a quarterly basis, the survey on external loans of more than €10,000 to enterprises provides further details on inter-company loans in accordance with the directional principle.

Annual data on equity capital and reinvested earnings come from surveys of direct investment enterprises in Poland and from Polish direct investors. Equity contributions without payment are covered. Enterprise surveys are a unique source for the compilation of the data. Information from additional sources, e.g. press reports, published company accounts, bilateral sources and exchange control authorities, are used only to update the business register.

The data on direct investment flows are available by country, region, economic zone and industrial sector according to the NACE nomenclature.

9.2 DEFINITION

The criterion of 10% ownership of directly owned enterprises is used to identify a direct investment relationship. The flows of direct investment are recorded on a directional basis. Reverse capital investments are observed, but are negligible for the moment.

Inter-company loans are broken down by maturity. Financial leasing is also included. Trade credits between affiliated enterprises are derived from stock data.

Until now, special-purpose entities (SPEs) have not been established in the Polish economy, although resident enterprises establish enterprises abroad that have the sole purpose of serving as financial intermediaries. Only equity investments of these SPEs are included in the direct investment item.

For banks, only equity capital, reinvested earnings and permanent debt are included.

The debtor/creditor principle serves as a basis for the geographical allocation of direct investment flows.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

The fully consolidated system is not applied.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

None.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The source of data is settlements made by Polish banks.

Data on flows of inward and outward portfolio investment are generally collected on an aggregated basis. Data on portfolio investment stocks (see the i.i.p. section) are collected on a security-by-security basis, using the ISINs for the assets and the major proportion of the liabilities (Polish securities issued on the domestic public market or abroad). The only exception with respect to adherence to the security-by-security principle are Polish securities issued as a private placements on the domestic market.

10.2 DEFINITION

Equity securities include all types of tradable shares, and, as regards data on stocks for the i.i.p., other types of non-tradable equity
securities bearing ISINs (e.g. nominative shares). Shares in investment funds and depositary receipts (e.g. ADRs or GDRs) are also treated as equity. Debt securities include all kinds of long and short-term securities. The one-year original maturity criterion is applied to classify securities as long or short-term. Included are Treasury bonds and notes, corporate bonds, Treasury bills, commercial paper and negotiable certificates of deposit. Debt securities with embedded financial derivatives (e.g. convertible bonds or bonds with a put option) are also included.

Financial derivatives (tradable separately) are excluded from portfolio investment and are recorded in a separate item of the b.o.p. Transactions in repurchase agreements and related operations are also excluded from portfolio investment and are presented as currency and deposits in the other investment category.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

Interest on debt securities is not accrued. No data enabling a separation of the transaction value into principal and interest are collected.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

The security-by-security data compilation system, providing for calculation of net transaction data (flows derived from stocks), is under construction. The new system will enable the separation of debt security transactions into principal and accrued interest and, as a result, will allow accrued interest to be classified correctly as income on portfolio investment.

10.6 ESTIMATION METHODS

None.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The source of data on financial derivatives is settlements made by Polish banks.

All financial flows resulting from the settlement of transactions in financial derivatives (except for repayable initial margins) are registered as financial derivatives. This means that variation and option margins are classified as financial derivatives. The data are collected on a gross basis.

In January 2004 a new codification was introduced, providing for breakdowns by underlying instrument (foreign exchange, interest rates, other instruments) and by the type of derivative (options, futures, FX swaps, currency swaps, IRS, FRA, other).

11.2 DEFINITIONS

Financial derivatives constitute a separate category of the financial account in the Polish b.o.p. statement. The definitions used by Narodowy Bank Polski are generally in line with the BPM5 (i.e. with the publication Financial Derivatives: A supplement to the Fifth Edition of the Balance of Payments Manual, 2002). The financial derivatives category includes all symmetric risk instruments such as futures, forwards and swaps, and asymmetric risk instruments such as options. Income on foreign exchange derivatives transactions is recorded under financial derivatives.

The first-known counterpart criterion is used to identify the residency of counterparts.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.
11.5 INTENDED HARMONISATION
None.

11.6 ESTIMATION METHODS
None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION
Other investment covers trade credits, loans, currency and deposits and other assets and liabilities.

Data for trade credits are collected through quarterly surveys of major exporters and importers. The surveys provide quarter-end information on assets (prepayments on imports and trade credit extended to exports separately) and liabilities (prepayments on exports and trade credits received on imports). Data on trade credits regard the other sectors, although the low amount of credit received by local governments are covered. The breakdown of long-term and short-term trade credits by maturity is available as from 2003.

Data regarding the external loans and borrowings of the general government are provided by Narodowy Bank Polski and Bank Gospodarstwa Krajowego (both play the role of government agents). For the banking sector (including the monetary authority), the flow data (settled transactions) are provided by banks that are engaged in operations with non-residents. These flows are checked and reconciled with stocks. A breakdown by maturity is available.

The data on enterprises’ loans in the monthly b.o.p. are estimated on the basis on bank reports and they are broken down by maturity. The data published in the quarterly b.o.p. are derived from a survey conducted on a quarterly basis. The information concerns loans extended and repaid in cash, goods or services as well as a cancellation of the loan amount or a reorganisation of debt through rescheduling or refinancing. Data on financial leasing are recorded. Information reported by private individuals is also included. A breakdown by maturity is available.

Currency and deposits comprise transactions of Polish banks’ assets and liabilities arising from current accounts and deposits as well as foreign currency banknotes and coins held in banks’ vaults. The data are supplemented with information on changes of stocks in accounts the Polish non-banking institutions hold with banks abroad.

12.2 DEFINITION
In principle, the definitions for other investment transactions are in line with the BPM5.

The other investment item covers loans, trade credits, currency and deposits and other assets and liabilities. Financial leasing is covered under loans. Foreign currency banknotes and coins, as well as repurchase agreements, are included under currency and deposits.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

12.4 GAPS
None.

12.5 INTENDED HARMONISATION
None.

12.6 ESTIMATION METHODS
None.
13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on transactions in reserve assets are obtained from the NBP’s records on a monthly basis.

A breakdown by instrument is available. The data on reserve assets are collected in currencies in which particular transactions were settled.

13.2 Definition

Narodowy Bank Polski is the holder of the official Polish international reserves. In principle, the recommendations of the BPM5 are applied for the recording of reserve assets. The reserve assets comprise monetary gold, special drawing rights (SDRs), the reserve position in the IMF, foreign exchange (currency and deposits, securities and financial derivatives) and other claims (repurchase agreements). Transactions with residents are excluded.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

The accruals principle is not applied.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The i.i.p. is compiled for all financial account items (i.e. direct investment, portfolio investment, financial derivatives, other investment and reserve assets). Assets and liabilities are compiled separately.

The i.i.p. is compiled annually and published nine months after the end of the reference year. Components constituting external debt items are compiled quarterly. The information on external debt is published three months after the end of a reference quarter.

14.1.2 DIRECT INVESTMENT

The data on direct investment stocks are derived from an annual survey among Polish direct investors and direct investment enterprises resident in Poland. Data from the surveys cover information on investment in equity, contributions in kind, reinvested earnings, inter-company loans, trade credits, and bonds and money market instruments. The data on equity refer to the balance sheet value based on an interim but not current revaluation. The data on stocks of loans are based on the face value. The bonds and money market instruments are recorded at market value. Only pure stock data are used. The reconciliation exercise includes adjustments for exchange rate changes and other adjustments.

A full geographical (by immediate country and ultimate beneficiary owner) and industrial allocation (NACE) can be provided.

14.1.3 PORTFOLIO INVESTMENT

Data on non-resident holdings of securities issued by Polish residents in the domestic market are generally supplied by intermediaries, i.e. custodian banks, brokerage houses and clearing houses. With regard to Treasury securities issued in either domestic or foreign markets, data on non-resident holdings are supplied by the Ministry of Finance. Data on securities issued on foreign markets by banks and enterprises are reported individually to Narodowy Bank Polski. The residual approach is applied. Data on non-resident holdings of Polish securities issued in foreign markets are adjusted with resident end-investor data on holdings of such securities.
Data on government portfolio investment assets in the form of securities are obtained from a bank serving as settlement agent. Data on non-government portfolio investment assets are supplied directly by Polish end-investors.

For liabilities, the information on equity securities is based, in general, on the market value and information on debt securities is based, in general, on the face value. For assets, information on both equity securities and debt securities is based on the market value.

For data on portfolio investment assets, a geographical breakdown (by country of issuer) and a currency breakdown are available.

For the separation of direct and portfolio investment in liabilities, the value of non-resident direct investors’ holdings of equity securities registered on custody accounts with Polish banks is estimated using the results of the survey of direct investment in Poland and data on major shareholders in Polish companies provided by the Polish Securities and Exchange Commission. The 10% holding criterion is applied. This is a company-by-company estimation rather than a security-by-security estimation based on the assumption that preferred, nominative and other types of non-tradable shares of each public company are priced as ordinary shares of this company. They are classified as portfolio investment in the i.i.p. Assets separation is carried out by the reporting entities (Polish end-investors). Holdings of non-resident equity securities that entitle the reporting entity to a share of 10% or more in the capital or voting power of a single company are excluded from the reports. No separation is carried out for corporate debt securities, neither in the case of liabilities nor in that of assets.

The i.i.p. stocks and b.o.p. flows are reconciled (only for liabilities) with regard to exchange rate changes and with regard to price changes (for equities only; estimated with the WIG – Warsaw Stock Exchange Index).

14.1.4 FINANCIAL DERIVATIVES
No data of publishable quality and methodologically consistent with the BPM5 are available for stocks of financial derivatives. The data collected from Polish banks are insufficient for the proper valuation of positions in financial derivatives. They are a measure of risk exposure only.

14.1.5 OTHER INVESTMENT
Other investment covers trade credits, loans, currency and deposits, as well as other assets and liabilities.

Trade credits data are based on the answers to a quarterly survey of major exporters and importers. The information is based on the nominal value. The data refer mainly to other sectors.

Information on loans is broken down by sector. Data on central and local government’s loans are provided by settlement agents and the MoF. Figures on banks’ external loans are derived from money and banking statistics. Data on corporate loans are obtained from quarterly surveys and are compiled on a loan-by-loan basis, and in the original currency. The information is based on the face value.

The data on currency and deposits are derived from the NBP’s balance sheet for Narodowy Bank Polski and from money and banking statistics for other banks. Data on assets of non-government and non-bank entities in the form of accounts with banks abroad are also included. The position covers repurchase agreement transactions. The data are based on the face value.

Other assets and liabilities cover data on assets and liabilities other than loans, debt securities, trade credits, currency and deposits.

14.1.6 RESERVE ASSETS
Narodowy Bank Polski is the holder of the official Polish international reserves. The information on stocks of official reserve assets is derived from the NBP’s balance sheet and is
available on a monthly basis. The coverage and concepts are in line with the BPM5. Reserve assets are calculated at market or approximate-to-market value and cover only actually existing assets denominated in foreign currencies. Claims on residents are excluded.

A detailed instrument breakdown is published monthly in the Data Template on International Reserves and Foreign Currency Liquidity.

14.2 DEVIATIONS FROM AGREED DEFINITIONS

None.

14.3 GAPS

No data on financial derivatives.

14.4 INTENDED HARMONISATION

It is intended to further develop the data collection system for financial derivatives.

14.5 ESTIMATION METHODS

None.

15 CONTACTS

This country information was drafted by Poland in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Poland should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Banco de Portugal has been responsible for compiling and producing the Portuguese balance of payments (b.o.p.) statistics since 1963. Between 1948 and 1962 the Inspeção do Comércio Bancário para as Instituições Bancárias (Banking Supervisory Authority) was responsible for their collection. Further to the full liberalisation of foreign exchange regulations and the commitment by Portugal with regard to statistical harmonisation at the European level, a new methodological and statistical production system was introduced in 1993 in close cooperation with the banking community.

2.2 LEGISLATIVE PROVISIONS

The legal basis for the compilation of b.o.p. transactions is the Organic Law of the Banco de Portugal (Law No 5/98 of 31 January 1998), as amended by Decree Law No 118/2001 of 17 April 2001. This law allows the Banco de Portugal to request information from any public or private body for statistical purposes, in particular within the scope of its cooperation with the European Central Bank.

The Banco de Portugal is authorised to collect data from both banks and non-banks (direct reporters and the official sector), and Decree Law No 295/2003 of 21 November 2003, as amended by the Rectification Declaration No 9/ 2004 of 14 January 2004, imposes a general obligation on banks and non-banks to report b.o.p. transactions.

Details of the information to be reported under the b.o.p. framework are provided in the Instruction of the Banco de Portugal on External Operations Statistics No 1/96 of 17 June 1996, as amended by Instruction No 21/ 2001, of 17 September 2001, mainly regarding the introduction of an exemption threshold (€12,500) for bank reporting. In the field of portfolio investment, specific details about reporting are defined through the Instruction on Securities Statistics No 15/99 of 15 June 1999.

2.3 INTERNAL ORGANISATION

The Balance of Payments and International Investment Position Statistics Division, which has a staff of 27, within the Statistics Department of the Banco de Portugal is in charge of the methodology, compilation, production and analysis of the b.o.p, the i.i.p. and the template on international reserves and foreign currency liquidity. It consists of four units: the Balance of Payments Statistics Unit, the International Investment Position Statistics Unit, the BOP and IIP Statistics Processing Unit, and the BOP and IIP Statistics Processing Unit – Oporto branch.

The Balance of Payments Statistics Unit is responsible for the conception and management of the b.o.p. information system and, in the field of current and capital account statistics, for data processing, compilation and quality control, reporting to international organisations, participation in methodological discussions and the conduct of economic and statistical analysis.

The International Investment Position Statistics Unit is responsible for the conception and management of the i.i.p. information system and, in the field of financial account and i.i.p. statistics, for data processing, compilation and quality control, reporting to international organisations, participation in methodological discussions and the conduct of economic and statistical analysis.

The BOP and IIP Statistics Processing Units deal with the processing, validation and quality control of information reported by banks and enterprises (including information from direct investment surveys). Data received from banks account for 70% of the monthly b.o.p. Around 1.0 million records are received every month, mainly via a file-transfer system. Enterprises, including around 1,000 direct reporters, send data to the Banco de Portugal by electronic
means, but also on printed forms in the case of small companies.

### 2.4 EXTERNAL COOPERATION

Several institutions provide the Banco de Portugal with supplementary information on some b.o.p. items. The *Instituto Nacional de Estatística* (INE – National Institute of Statistics) supplies data on both external trade, according to physical movements of goods, on the basis of which estimates are made for the goods item in the current account, and trade credits. The INE and the *Direcção-Geral do Turismo* (Directorate-General for Tourism) provide additional data for the travel item. *Euronext Lisbon* (Lisbon and Oporto Stock Exchange) and the *Comissão do Mercado de Valores Mobiliários* (CMVM – Securities Market Commission) provide the Banco de Portugal with information useful for the compilation of the portfolio investment item. The *Direcção-Geral do Tesouro* (Treasury) and the *Instituto de Gestão do Crédito Público* (IGCP – Public Debt Management Office) supply data on the external transactions of the general government sector.

### 2.5 USERS

The Banco de Portugal maintains regular contacts to users such as the Ministry of Finance and the *Conselho Superior de Estatística* (Higher Council for Statistics) which is responsible for the coordination of statistics produced in various areas, e.g. between the Banco de Portugal and the INE. Regular contacts are maintained with users/suppliers of data through bilateral meetings. The b.o.p. is also used by the INE in the production of the national accounts, particularly the ROW item, and by the Banco de Portugal in the production of the national financial accounts (Statistics Department), for economic analysis (Economic Research Department) and in the field of cooperation (International Relations Department). Some private economic agents (e.g. banks, companies and universities) make also use of b.o.p. data.

Data in compliance with the standard components of the 5th edition of the IMF Balance of Payments Manual (BPM5) are supplied to international organisations, such as the ECB, the European Commission (Eurostat), the IMF, the OECD, the BIS and the United Nations, on a regular basis.

### 3 STATISTICAL SYSTEM

#### 3.1 TYPE OF COLLECTION SYSTEM

The Portuguese data collection system is mainly based on settlements, with transaction-by-transaction reporting, covering credit and debit flows that affect the country’s external position, being applied by banks and direct reporters.

In addition to the settlements, the general collection system also includes specific reporting for the following sets of information:

- trade statistics are obtained from the INE and the debit side of the transport item is also derived from information provided by the INE;
- estimates for the credit side of the travel item are derived from tourism statistics provided by both the INE and the Direcção-Geral do Turismo;
- security-by-security databases both on domestic and on foreign securities ensure compliance with the accruals principle regarding portfolio investment income;
- reinvested earnings and trade credits between foreign direct investment (FDI) enterprises are obtained from surveys on direct investment stocks;
- a security-by-security reporting sub-system on portfolio transactions is the source used in the compilation of the portfolio investment item;
- a monthly survey of banks is the source used for compiling the financial derivatives item;
- monthly trade credits are estimated from quarterly surveys among key Portuguese exporters/importers.
Banking statistics on the banks’ external positions are used for compiling data on the monetary financial institution (MFI) sector within the other investment component. The accounting registers of the Banco de Portugal are used to derive data on reserve assets and on the Monetary Authority sector within the portfolio investment and the other investment items of the financial account.

3.2 REPORTING AGENTS

(i) **Banks** are required to report the following types of external transactions: those carried out on behalf of their resident and non-resident customers or on their own account, whether acting as an intermediary between a non-resident (bank or non-bank) and another resident bank, or carrying out interbank operations affecting an external position. Banks engaged in trading in financial derivatives are also requested to report these data through a monthly survey.

(ii) **Direct reporters**: general direct reporters report all transactions with non-residents, whether settled through a resident bank or not. Residents holding accounts abroad must report settlements via non-resident banks. Residents holding current accounts with non-residents must report all settlements cleared through those accounts. Additional data are also collected for enterprises/households on external credits and loans, and inward and outward direct investment.

(iii) **Enterprises involved in FDI**: data on stock surveys for direct investment, both abroad and in Portugal, are collected from resident FDI enterprises.

(iv) **Securities custodians**: resident securities custodians provide information about portfolio investment transactions/positions on domestic securities on behalf of their non-resident clients and on foreign securities on behalf of their resident clients. MFIs are also compelled to report transactions/positions on their own account. Investors operating through non-resident custodians have to report directly their transactions and stock data.

(v) **Other sources:**
- the INE reports overall statistical data on international trade (goods) and trade credits;
- the Direcção-Geral do Tesouro and the Instituto de Gestão do Crédito Público (IGCP – Public Debt Management Office) report data on the external transactions of general government;
- the Banco de Portugal supplies data on its external operations (Accounting and Markets Departments) and on MFI’s external positions (Statistics Department – Monetary and Financial Statistics Division).

3.3 THRESHOLDS

Under the general reporting system, banks may be exempted from reporting transactions in an amount of below €12,500. Missing data concerning transactions below €12,500 are estimated according to information reported in the same period of the previous year for transactions below €12,500.

The portfolio investment collection system has a simplification threshold of €500 million. All reporting institutions whose monthly transactions do not reach €500 million and, at the same time, have less than €500 million in outstanding amounts report only once a year.

3.4 AVAILABILITY OF DATA

The Banco de Portugal compiles and produces a monthly Portuguese b.o.p. on a transactions basis, with a large detailed sectoral and geographical breakdown for some items, which is first released on the website of the Banco de Portugal and subsequently published in the “Boletim Estatístico”. A less detailed b.o.p. on a monthly basis is also available and published in the Monthly Economic Indicators.

The Banco de Portugal can provide to the ECB full monthly b.o.p. data in line with the
EU and accession countries’ balance of payments statistical methods

Timeliness laid down in Guideline ECB/2003/7 of 2 May 2003. A euro area/non-euro area breakdown is possible for all the items in the b.o.p. statistics. In the case of delays by the respondents, which do not generally occur, the Balance of Payments and International Investment Position Statistics Division produces estimates.

3.5 TIMELINESS

The reporting agents have ten working days from the end of the reporting period (month) within which to submit data to the Banco de Portugal. For the portfolio investment collection system, the deadline is the twelfth working day. The Balance of Payments and International Investment Position Statistics Division has until the tenth working day of the month following receipt of the data to produce the reports for the various publications. Monthly b.o.p. data (on a transactions basis) are available within six weeks. They include estimates for trade statistics, which are received from the INE with a delay of five weeks (preliminary statistics on external trade are sent to the Banco de Portugal within ten weeks), for the transport, insurance, travel and current transfers items, for reinvested earnings of direct investment, for the accruals of portfolio investment and other investment (non-banks) income, and for trade credits.
3.6 COMPILATION FREQUENCY

The Portuguese b.o.p. on a transactions basis is compiled on a monthly basis.

3.7 DATA CONTROLS

For the information reported via the settlement system and the portfolio investment system, there are different levels of checking controls. First, data are checked for errors concerning the protocol and label (e.g. file name, recording month or number of records) by means of an automatic procedure for data sent by file transfer, and on a PC for data sent on disk or in paper form (after being entered on a PC).

Second, quality controls are incorporated in both procedures in order to validate coding errors, such as type of account, statistical classification, currency and country; there is also an implicit plausibility check known as “meaningful transaction”. Other controls are carried out in order to achieve consistency between flows and positions, to check transactions involving two or more resident banks, to validate data from banks and companies for those enterprises with the status of direct reporting company or with accounts held abroad, and to check settlements from banks with portfolio investment data from custodians. Additional checks are made in order to control the evolution of a time series for a specific item (within a specific bank). Amendments are made whenever reporters send further corrections.

Regarding trade in goods and MFI’s transactions, data on settlements are also used for checking purposes.

Data from the other sources are checked in order to identify any inconsistencies within the information, with the other items of the b.o.p., and in relation to their evolution. In addition, other external sources, such as securities clearing houses, national institutions involved in the numbering of securities and the regulation of the capital markets, other statistics, newspapers, banks’ and companies’ accounting reports and reports of associations in the economic sector are used for quality control purposes. Data provided by the Banking Supervision Department are used for checking statistics compiled for the MFIs, namely within the FDI stocks and the other investment income frameworks. The BIS database is used to check the quality of data obtained from the reporting system on deposits held abroad by residents.

3.8 REVISION POLICY

Monthly data are revised on a quarterly basis, at the end of each quarter and at the end of the year. The data for the first six months are revised once more at the end of the first half of the year. For example, in March data for both January and February will be revised, in June data for January to May will be revised, and in December data for all months of the year will be revised (as well as data for the previous year, if necessary). The annual b.o.p. becomes definitive after two years.

3.9 PUBLICATION

Data on the b.o.p. are published monthly and annually. The titles of the publications produced by the Banco de Portugal on b.o.p. statistics are listed in Sub-section 15.1. Before the dissemination of those publications, a first disclosure of b.o.p. statistics is made on the internet (website: www.bportugal.pt). Users are informed in advance of the date on which publications will be made available. The “Boletim Estatistico” regarding a certain month contains new b.o.p. data for the previous month, while in the “Monthly Economic Indicators”, new b.o.p. data refer to two months before. The Banco de Portugal (BOP and IIP Statistics Division) also has a commitment to the IMF’s Special Data Dissemination Standard (SDDS) regarding the dissemination of statistics on the b.o.p., the i.i.p., the template on international reserves and foreign currency liquidity and external debt.
Data on trade in goods are obtained from the INE. The figures on imports and exports related to intra-EU trade are derived from the data obtained within the Intrastat system. For extra-EU trade, data are derived from customs declarations. The reference time underlying these statistics is the time of the physical transaction in the goods. The INE provides preliminary estimates of international trade within five weeks, in compliance with the SDDS requirements. These estimates allow the Banco de Portugal to provide a first draft of the b.o.p. within a six-week period.

The estimates provided by the INE are based on data submitted by a set of major exporters/importers, which broadly represent 70% of the total trade within the European Union, and on data collected through customs declarations (for trade outside the European Union). A further adjustment is made by the Banco de Portugal, with the aim of approaching “definitive” data. INE data are adjusted by the b.o.p. compilers for the following items:

- information below the Intrastat exemption threshold and non-response;
- government trade;
- the c.i.f./f.o.b. margin;
- goods not crossing the border;
- f.o.b. goods not included in trade statistics; and
- goods procured in ports by carriers (imports).

The INE compiles trade statistics according to the “special trade” principle.

Data on trade in goods included in the Portuguese b.o.p. are fully compliant with BPM5 standards.

4.3 Deviations from agreed definitions

None.

4.4 Gaps

None.

4.5 Intended harmonisation

None.

4.6 Estimation methods

Regarding the compilation of the b.o.p., imports reported by the INE are adjusted mainly to produce figures on a f.o.b. basis. For this adjustment, an estimate is made of the implicit c.i.f./f.o.b. margin and of the split between resident and non-resident transport and insurance enterprises. Those components estimated to have been carried out by non-resident transport and insurance companies are added to imports of merchandise transport, freight insurance services and other current transfers.

The c.i.f./f.o.b. rate was calculated using a matrix of import quantities and costs according to the types of goods, the country of origin, the modes of transport utilised and the nationality of the carriers, valued by the respective transport costs. The construction of the matrix was based on available information disclosed by the INE (namely the nationality of the carrier) for 1992 and on information gathered from the main transport agents for each mode of transport and from some insurance companies approached by the Banco de Portugal for that purpose.

Based on information made available by the INE, the weights of the modes of transport utilised are updated regularly.

The c.i.f./f.o.b. rate is a fixed percentage for each mode of transport which applies to all partner countries. No additional adjustments are made for the non-euro area countries.
The geographical allocation of goods is derived from the INE data, according to the country of consignment principle. However, estimates reported within five to six weeks are made available without a geographical allocation. In that case, the Banco de Portugal applies the structure of countries for the same month in the previous year.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Please refer to the information on the general reporting system (see Sub-section 3.2).

5.2 DEFINITION

The Banco de Portugal mainly follows the recommendations set forth in the BPM5. The residency principle is fully applied. BPM5 rules with respect to the valuation of transactions and their time of recording are also applied. The services classification used follows the BPM5 and the OECD-Eurostat classification, with a few exceptions.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

5.4 GAPS

None.

5.5 INTENDED HARMONISATION

None.

5.6 ESTIMATION METHODS

The travel item includes estimates for expenses settled in Portugal by foreigners with euro brought from another euro area country (for credits) and for expenses settled abroad by residents in Portugal with euro obtained before leaving the country (for debits). The process of estimation of the travel item takes into account information available in the Banco de Portugal, namely data on payments with other means like credit and debit cards, cheques and bank transfers. Data are first estimated on a settlement basis. Compliance with the transactions principle relies on the year-on-year rate of change in the settlement figures, applied to the previous monthly year-on-year transaction data. Half-yearly adjustments based on the available physical indicators are then made.

An estimated split is made between the service and the transfer components of insurance.

Estimates are included in services (transport and insurance) and in transfers as a result of the procedure followed to value imports on a f.o.b. basis.

Financial services recorded in the b.o.p. are compiled from settlement data, which include a specific code to cover these kinds of transactions.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION

6.1.1 GENERAL

The compensation of employees item is derived from the general reporting system (see Sub-section 3.2) and is complemented with information disclosed by Eurostat within the framework of the compilation of the b.o.p. of the European Union institutions vis-à-vis Portugal.

As regards investment income, the accruals principle is applied to almost all its components. The only exception concerns other investment, for which data on a settlement basis are obtained for banks and the monetary authority. For the other sectors, data derived from stocks are used to make estimates of accrued amounts. Those estimates are revised once the results of the stock surveys are available, at which time they become definitive.
Within investment income, a breakdown into sub-components is available on a monthly basis. The criterion applied for geographical allocation differs for each type of investment income:

(i) for **direct investment income**, excluding reinvested earnings, flows are allocated to the country reported under the settlement system; for reinvested earnings, data are allocated to the country of residency of the actual counterpart (according to the debtor/creditor principle) on the basis of the structure of countries in the stock surveys;

(ii) for **portfolio investment income**, flows are allocated to the country of residency of the security issuer in the case of credits, and to the country of the first-known counterpart in the case of debits, both being fully in line with the entries registered under the respective financial account assets/liabilities; and

(iii) for **other investment income**, the country of settlement is used to allocate flows of the banking sector geographically. For non-banks, a geographical allocation of accruals is derived from stock data.

A geographical allocation is also available for accrued historical data compiled monthly for the period 1996-98.

### 6.1.2 Income on Direct Investment

Under direct investment income, reinvested earnings are accrued. The main sources for data on reinvested earnings are stock surveys on direct investment activities performed abroad by residents and in Portugal by non-residents. These stocks are compiled every two years to produce annual data. Given the statistical requirements regarding the production of the b.o.p. on both a monthly and a quarterly basis, estimates are made on this issue. Those estimates are initially made on an annual basis, taking into account the year-on-year rate of change in the GDP of those countries that are major recipients of direct investment from Portugal (for credits) and the year-on-year rate of change in the GDP of Portugal (for debits) applied to the previous direct investment surveys results. Monthly figures are subsequently obtained by dividing the estimate by twelve and by deducting the respective monthly dividends obtained from the settlements.

Settlement data are used for the compilation of income on debt transactions between direct investment companies.

### 6.1.3 Income on Portfolio Investment

In accordance with the description in Sub-section 10.1, a new system for portfolio investment data was introduced in the first quarter of 2000. The accruals on portfolio investment income are estimated on the basis of monthly stock data. This procedure is applied to portfolio investment income on all types of securities, with the exception of interest associated with the liabilities side of investment trust units (e.g. collective investment institutions, CIIs) due to a partial lack of information, the latter data being based on settlements.

The new portfolio investment data collection system allows compliance with the accruals principle for all types of securities, based on security-by-security databases for both domestic and foreign securities.

### 6.1.4 Income on Other Investment

Income of resident non-banks from both deposits and loans is estimated monthly on an accruals basis, with account being taken of stock data and market interest rates.

The figures for income on reserve assets are provided by the Banco de Portugal under the general reporting system. Data are compiled on a settlement basis.

### 6.2 Definitions

The Banco de Portugal mainly applies the recommendations of the BPM5 for income.
6.3 DEVIATIONS FROM AGREED DEFINITIONS

Other investment income of the monetary sector is not accrued.

6.4 GAPS

None.

6.5 INTENDED HARMONISATION

Income on reserve assets will, in principle, be accrued on a monthly basis. The securities system implemented in Portugal is expected to make a contribution in this domain.

6.6 ESTIMATION METHODS

No quarterly estimates are produced. All estimates are made on a monthly basis and aggregated to obtain the quarterly figures.

7 CURRENT TRANSFERS

7.1 SPECIFIC FEATURES OF DATA COLLECTION

Please refer to the information on the general reporting system (see Sub-section 3.2).

7.2 DEFINITION

The Banco de Portugal has implemented the recommendations of the BPM5, in accordance with the harmonisation proposals made by the ECB. In this context, transfers which do not reflect a change in the stocks of assets of one or both parties involved in the transaction are recorded as current transfers. The classification of transfers as public or private primarily takes into account the criterion of the institutional sector of the resident. Thus, transfers involving the Portuguese state are registered as public transfers and those that involve other resident sectors are classified as private transfers.

The transfers data received from the EU institutions is split into current and capital transfers. Additional details reported by the Treasury are useful in this field.

The following are recorded as current transfers: the ESF (100%); the EAGGF (Guarantee) (100%); the ERDF (15%); the EAGGF (Guidance) (20%); and the FIFG (45%).

7.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

7.4 GAPS

Data relating to transfers in kind are difficult to obtain given that the b.o.p. statistical collection system mainly relies on settlement data.

7.5 INTENDED HARMONISATION

A quality assessment is made whenever Eurostat provides information on the b.o.p. of the European Union institutions vis-à-vis Portugal. Regular contacts are established with official entities in order to monitor the quality of and the breakdown into current and capital transfers.

7.6 ESTIMATION METHODS

For transfers within the European Union, a weighting scheme is applied with the aim of performing a split between current and capital transfers.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Please refer to the information on the general reporting system (see Sub-section 3.2).

8.2 DEFINITION

As far as capital transfers are concerned, the Banco de Portugal has implemented the recommendations of the BPM5, in accordance
with the harmonisation proposals made by the ECB. In this context, only transfers which reflect a change in the stocks of assets of one or both parties involved in the transaction are included as capital transfers (please refer to the information on current transfers in Sub-section 7.2).

The criterion applied to split capital and current transfers respects, above all, the Eurostat recommendation, which was adjusted in accordance with the final destination of the EU funds transferred to Portugal. The breakdown applied was based on the purposes of the EU funds with reference to the period 1993-97. Those EU transfers used to finance infrastructure projects – namely the Cohesion Fund (100%), the Specific Programme for the Development of Portuguese Industry (100%), the ERDF (85%), the EAGGF (Guidance) (80%) and the FIFG (55%) – are recorded as capital transfers. All the other funds are recorded under current transfers.

The item acquisition/disposal of non-produced, non-financial assets is derived from the general reporting system (see Sub-section 3.2).

Transactions related to the acquisition/disposal of property rights, trademarks, franchises, etc., are recorded in the capital account under acquisition/disposal of non-produced, non-financial intangible assets.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Data relating to certain capital transfers, such as migrants’ transfers (excluding workers’ remittances), investment grants in kind and debt forgiveness by companies, are difficult to obtain, as the b.o.p. statistical collection system mainly relies on settlement data reported by resident banks, which might not cover these items properly.

8.5 INTENDED HARMONISATION

Please refer to the information on current transfers (see Sub-section 7.5).

8.6 ESTIMATION METHODS

Please refer to the information on current transfers (see Sub-section 7.6).

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The Banco de Portugal collects data on a transaction-by-transaction basis for inward and outward direct investment flows via the External Transaction Report (COE) registers submitted by the resident banking community. The Banco de Portugal also receives detailed data on direct investment transactions above €250,000 via the Direct Investment Statistical Declaration, i.e. data regarding the identification of the resident and non-resident parties to the transaction, a description of the transaction, and supplementary information on the equity participation. Whenever transactions are performed via a non-resident bank, the resident must report directly the transaction settlement which takes place abroad to the Banco de Portugal.

Definitive direct investment statistics are also based on the results of annual stock surveys on both Portuguese direct investment abroad and foreign direct investment in Portugal. These surveys are the source used for recording reinvested earnings. For foreign direct investment in Portugal, the survey was first launched to gather data for end-1995. For Portuguese direct investment abroad, data based on a stock survey began to be available from 1996 onwards. Historical estimates of reinvested earnings for the years before 1996 can be made available.
The geographical breakdown is based on the residency of the actual issuers (i.e. debtor/creditor principle).

In the event that a change of ownership of a resident company from a non-resident to another non-resident direct investor is revealed from the survey, the change is, in principle, recorded both in the FDI stocks and in the corresponding b.o.p. flows.

Transactions settled via an exchange of shares are only collected from the FDI stock surveys, being recorded at the time the exchange of shares takes place and valued according to the accounting entries reported through the surveys.

**9.2 DEFINITION**

The new version of the Nomenclature of External Operations has complied with the 10% rule since the introduction of Decree Law No 321/95 of 28 November 1995, which took into account the international recommendations regarding foreign direct investment. The direct investment item in the Portuguese b.o.p. includes short-term transactions between direct investors and direct investment companies. Furthermore, all cross-border transactions in real estate are covered.

Data provided by stock surveys are also being used to improve the coverage of long-term/short-term loans between enterprises with a direct investment relationship. Equity contributions without payment (provision of real or financial assets) are also covered by those surveys, as well as trade credits between affiliated enterprises.

The distinction between direct investment and portfolio investment is possible using data on stocks acquired by investors through secondary markets. The 10% rule is mainly applied to this purpose.

Special Purpose Entities are treated, both for inflows and outflows, in accordance with the BPM5 and OECD benchmark recommendations, i.e. they are included if short-term transactions between banks or other financial intermediaries are not involved.

**9.3 DEVIATIONS FROM AGREED DEFINITIONS**

The current operating performance concept is not fully applied for the valuation of direct investment income. Instead, the Banco de Portugal has been using the net results of companies deducted from capital gains and losses and other extraordinary items.

**9.4 GAPS**

None.

**9.5 INTENDED HARMONISATION**

Consolidated balance sheets have been requested since 1997 in the surveys on direct investment. An improvement in the coverage of group-related enterprises’ operations and of those of indirectly owned companies is expected as a result of the new layout of the FDI survey.

**9.6 ESTIMATION METHODS**

There are no quarterly estimates in the field of direct investment.

Monthly estimates are produced for reinvested earnings (see the description in Sub-section 6.1.1 on investment income) and for trade credits between affiliates. Trade credits recorded under direct investment are estimated from FDI stock surveys. Monthly figures are obtained by applying the monthly year-on-year rate of change of imports (for credits received from abroad) and of exports (for credits granted to non-residents) to the stock value of trade credits derived from the results of the previous FDI stock surveys.
10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The Statistics Department introduced a new portfolio investment collection system in the first quarter of 2000, based on a single report that is used to collect information for purposes of the b.o.p., monetary and financial and the financial accounts statistics.

It is a full-automated system whereby domestic securities custodians provide information about portfolio investment transactions in domestic securities on behalf of their non-resident clients and in foreign securities on behalf of their resident clients. MFIs must also report transactions on their own account. Investors operating through non-resident custodians must report their transactions and stock data directly. This is a security-by-security and an investor-by-investor system. Resident investors are identified by their fiscal number or by their institution number in the case of pension or investment funds. Non-resident investors must have been previously identified in the system (using a specific type of record within the reporting file), with exception of households that must be identified by the ISO code for their country of origin (PRT if they are residents, other country codes if they are non-residents). Identification includes the country of residence and the institutional sector of the non-resident investor.

The investor or custodian must report monthly statistical information on transactions and quarterly data on end-of-period positions. However, they may choose to report both transactions and stocks on a monthly basis. There is also a simplified regime of annual data reporting for those entities whose transactions and balance sheet assets fall below a certain threshold, as described in Sub-section 3.3.

The ISIN codes are used in the codification of the securities reported to the Banco de Portugal. Moreover, the existence of a centralised securities database may contribute to a further harmonisation of international statistics in this domain.

The geographical allocation criteria are based on the country of residence, on the assets side, of the issuer of the security (debtor) and, on the liabilities side, on that of the first known counterpart, for both flows and stocks. The geographical breakdown is possible for monthly flows and stocks. An euro area/non-euro area assets split is possible for historical data.

COE registers and MFI balance sheets are used for checking and quality control purposes.

10.2 DEFINITION

The Banco de Portugal mainly applies the recommendations of the BPM5 for portfolio investment.

Service charges, fees and commissions are identified separately in the specific reporting of securities. These transactions are, for the time being, still compiled through the reporting system for external operations based on COE, with different codes in each category.

The money market instruments that may be identified are treasury bills, commercial paper, Negotiable certificates of deposit (with original maturities of one year or less) and other short-term securities.

As explained in Sub-section 6.1.3 on portfolio investment income, the offsetting entry for accrued interest in securities portfolios is recorded under portfolio investment. This procedure is carried out on a monthly basis.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

The geographical allocation approach applied to portfolio transactions is the debtor principle for assets and the first-known counterpart principle for liabilities. The first-known counterpart may be the final client or the broker engaged in the securities operation.
10.4 GAPS

The major difficulties in the portfolio collection system concern the capture of securities transactions not deposited with resident custodians and the coverage of private placements.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

Accrued income based on monthly estimates is included in portfolio investment transactions.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

A new system for the collection of data for financial derivatives was implemented in 1999. This new system is based on a monthly survey, among the more important banks in this domain, on both flows and positions for assets and liabilities. This survey takes into account the most recent recommendations of the ECB and the IMF.

Financial derivatives transactions are also captured through the settlement system, which has a specific code for this type of transaction.

Banks have to report both their own positions and positions opened by their clients (mainly enterprises and individuals). The Banco de Portugal (Markets and Reserve Management Department) reports data for the monetary authority sector. Data for the general government sector will have to be compiled from other sources, namely the Treasury.

Monthly data are available with a breakdown by institutional sector of the resident counterpart to the transactions.

A breakdown of data by inflows and outflows is available. This breakdown is consistent with the recommendations of the IMF that, if compilers are unable, because of market practices, to implement this approach (that is, a separation between assets and liabilities according to the market value of the contract), all cash settlement receipts be recorded as a reduction in financial assets and all cash settlement payments be recorded as a decrease in liabilities.

The recording of the net stream of settlement flows associated with interest rate derivatives (forward rate agreements, interest rate swaps and the income component of the cross-currency interest rate swaps) is made under financial derivatives.

The instrument breakdown available is based on the type of instrument and the market risk, in accordance with the structure defined in the BPM5 for “Selected Supplementary Information”. The instruments available are futures, options, swaps, forward transactions and others (a residual figure that might include, for example, credit derivatives). The possible market risks are foreign exchange, single currency interest rate, equities, commodities and others (a residual figure).

The criteria for the geographical allocation of the counterpart are based on the country of residence of the clearing house, in the case of contracts traded in organised markets, and on the country of the counterpart, in the case of over-the-counter (OTC) contracts.

11.2 DEFINITIONS

The recording of margin payments for options and futures is carried out according to the ECB recommendations, i.e., initial margins and option-style variation margins are compiled through the settlement system and registered as “Currency and deposits” under other investment, and the futures-style variation margins are to be compiled through the above-mentioned new survey and recorded under financial derivatives.
11.3 DEVIATIONS FROM AGREED DEFINITIONS

The identification of the country of the counterpart in the case of OTC contracts may not always be conducted on the basis of the risk exposure, but may in some cases be based on the country of settlement, booking or trading.

11.4 GAPS

See Sub-section 11.3.

11.5 INTENDED HARMONISATION

None.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

B.o.p. flows for the MFI sector are derived from the MFIs’ balance sheet at the beginning and end of period. Differences are calculated in foreign currency and converted into euro by using the respective monthly average exchange rates.

In order to separately identify those transactions which are carried out through TARGET, MFIs report these transactions with a “neutral” code. Finally, the Banco de Portugal, which carries out the real payments, supplies these data as cross-border transactions, so that they are allocated to the Monetary Authority sector.

The collection system for other investment of other sectors (excluding the monetary authority, MFIs and general government) relies mainly on the information reported via COE registers. Data regarding the external loans and borrowings of the general government are provided by the Treasury.

Trade credits are estimated on a monthly basis by applying the monthly year-on-year rate of change of exports and imports, as reported by the INE, to the stock value obtained through a quarterly survey of major exporters and importers. The time of recording of trade credits is the time of the change of ownership of the items, based on the time of registration in the accounting books of the companies involved in these operations. At the time the i.i.p. is compiled, data on trade credits are reviewed within the reconciliation exercise between flows and stocks, taking into account the results of the surveys.

Actual flows of other investment, and not the change in stocks, are registered in the b.o.p., except for transactions concerning the MFI and Monetary Authority sectors.

Transactions recorded under the sub-item “other assets/other liabilities” mainly relate to residual financial operations, which are still under evaluation in order to obtain a proper classification.

Geographical breakdowns of historical data concerning other investment are available as from January 1996.

Sectoral, instrument and original maturity breakdowns are available, in the other investment category, on a monthly basis.

For other investment of non-banks, stock data on both assets and liabilities are combined with market interest rates to derive monthly accruals.

12.2 DEFINITION

In general, the Banco de Portugal has implemented the recommendations of the BPM5 and the harmonisation proposals made by the ECB.

Short-term claims and liabilities between affiliated enterprises are recorded under direct investment.
Foreign currency notes and coins and financial leasing are included in “loans/currency and deposits” within other investment.

Since January 1999, new codes have been introduced in the External Operations Nomenclature in order to separately collect data on repurchase agreements, sell/buy-back transactions and bond lending within the other investment category.

12.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

12.4 GAPS
None.

12.5 INTENDED HARMONISATION
None.

12.6 ESTIMATION METHODS
Trade credits are estimated from a quarterly survey of major exporters and importers. Monthly figures are obtained by using the monthly year-on-year rate of change of exports and imports, as reported by the INE.

Other investment includes a component estimated on a monthly basis to ensure compliance with the accruals principle for non-banks.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION
Part of the general reporting system (see Subsection 3.2).

13.2 DEFINITION
The Banco de Portugal follows the recommendations of the BPM5 and those of the ECB regarding the definition of the reserves of the Eurosystem.

All instruments are identified separately within the monthly reserve assets figure. Daily transactions are calculated through the change in stocks, valued at market prices and converted to euro using daily market exchange rates, except regarding “monetary gold”, for which monthly external transactions are reported.

13.3 DEVIATIONS FROM AGREED DEFINITIONS
There are no significant deviations in the Portuguese b.o.p. data available for reserve assets.

13.4 GAPS
None.

13.5 INTENDED HARMONISATION
None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION
Once the stock figures on direct investment, trade credits and financial derivatives were made available, a complete i.i.p. was produced, for the first time in Portugal, in September 1999, regarding end-1997 and 1998 stock data. When they become definitive, statistics for i.i.p. components are mostly compiled using pure stock data. The Banco de Portugal publishes in the “Boletim Estatistico”, on a monthly basis, the last complete annual i.i.p. made available and detailed end-of-quarter figures, based on pure stocks and accumulated flows, for the main components of the Portuguese i.i.p. (assets and liabilities), namely for direct investment, portfolio investment, other investment, financial derivatives (on a net basis) and reserve assets.
14.2 DEFINITIONS

14.2.1 GENERAL

14.2.2 DIRECT INVESTMENT
Final data on stock statistics are available through the Foreign Direct Investment in Portugal Questionnaire (first data concerning 1995), and through the Portuguese Direct Investment Abroad Questionnaire (1996 data were first made available), which are conducted in alternate years (biennially). Data supplied to the Banco de Portugal are based on book values, which are supposedly revalued according to accounting principles at current prices. Quarterly estimates are produced through a mixed stock data/accumulation of flows procedure over the following year in which pure stock data are not immediately available.

A full geographical allocation can be provided on an annual basis.

14.2.3 PORTFOLIO INVESTMENT
Until the end of 1999, pure stock statistics on resident holdings of securities were produced on the basis of information reported through a specific form. Detailed annual information was provided on the identity of the investor, the custodian, the denomination of the security (on a security-by-security basis), the codification of the security (e.g. ISIN), the type of security, the identity of the issuer and the valuation of stocks (physical quantity, currency and quotation of securities). Additional items, such as the currency of denomination of the securities and the sector of both the investor and the issuer, which were not included in the IMF 1997 Co-ordinated Portfolio Investment Survey, were requested. A complete geographical allocation was available according to the country of residence of the security issuer.

Data on stocks of domestic securities held by non-residents were produced on a monthly basis, until the end of 1999, through the reports collected from custodians (concerning physical quantities and nominal values of securities deposited in non-resident dossiers) and from the Portuguese stock exchange (concerning prices). A complete geographical allocation was available, based on the country of residence of the first known counterpart.

From 2000 onwards, stock data for both assets and liabilities are collected monthly, on a security-by-security basis, using the ISIN code as the security identifier. A complete geographical breakdown is available, based on the country of residence of the security issuer (assets) or of the first known counterpart (liabilities). Information reported under the security-by-security system is used to produce monthly estimates on stock statistics. Quarterly estimates on stock data are being published.

MFI balance sheets, data on stocks for collective investment institutions (CIIs), as reported by the CMVM, and Euroclear information on public debt securities are all used for checking and quality control purposes.

14.2.4 FINANCIAL DERIVATIVES
Options, futures, swaps and forwards are valued at market prices. In the case of futures, the market practice usually involves a daily settlement of gains and losses (variation margin), implying that their market value is zero.

14.2.5 OTHER INVESTMENT
Data on the monetary authority’s assets and liabilities are derived from the Banco de Portugal’s balance sheet. Data on the General Government assets and liabilities are collected directly from the Treasury. Data on banks’ assets and liabilities are collected through external positions of the banks’ balance sheets. A mix of BIS figures and an accumulation of flows was used to compile deposits of resident non banks with non-resident banks until 1997; accumulation of flows have been used since then. Stock figures on loans are derived from the accumulation of flows based on pure stocks
A quarterly survey of major exporters/importers is used to produce stock data on trade credits.

**14.2.6 RESERVE ASSETS**

The balance sheet of the Banco de Portugal is the source of these data. It is available, for this purpose, on a monthly basis.

**14.3 DEVIATIONS FROM AGREED DEFINITIONS**

Book values, supposedly revalued at current prices according to accounting principles, are applied to the stock figures on direct investment, instead of pure market values. The first disclosure of data is based on mixed stock data/accumulation of flows. After the results of the surveys are made available, in principle two years after the reference period, the figures become definitive, the final data being based on pure stock statistics.

The first known counterpart criterion is applied to split stocks on portfolio investment liabilities.

In the case of financial derivatives, contracts for hedging purposes are not always valued at market prices.

**14.4 GAPS**

End-of-period positions for external deposits and loans of the non-monetary private sector are currently obtained via the accumulation of flows.

**14.5 INTENDED HARMONISATION**

The Banco de Portugal is currently planning the implementation of a survey of end-of-period positions for external deposits and loans of non-monetary financial and non-financial enterprises.

**14.6 ESTIMATION METHODS**

None.

**15 ADMINISTRATION**

**15.1 TITLES OF PUBLICATIONS**

General publications of the Banco de Portugal:
- *Boletim Estatístico* – on a monthly basis;
- *Monthly Economic Indicators* – on a monthly basis;
- *Economic Bulletin* – on a quarterly basis;
- *Annual Report* – on an annual basis.

Specific publications on statistics related to the b.o.p./i.i.p.:
- “Investimento Directo de Portugal no Exterior: Estatísticas de fluxos e stocks para o ano de 1997 e estimativa de stocks para 1998 e 1999”, Supplement 1/00 to the Statistical Bulletin of December 2000 (available only in Portuguese; presents the first results for stocks of direct investment abroad).

**15.2 CONTRIBUTORS**

This country information was drafted by the ECB’s External Statistics Division and subsequently amended and agreed with Portugal. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Portugal should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

In accordance with the National Programme of Statistical Surveys and the Foreign Exchange Act, the official compiler of the Slovenian balance of payments (b.o.p.) is Banka Slovenije.

Banka Slovenije has been responsible for compiling the b.o.p. since 1991. Before then, Slovenia was part of Yugoslavia and its b.o.p. was compiled using a different methodology.

Slovenia’s b.o.p. is compiled by Banka Slovenije on the basis of the recommendations of the 5th edition of the IMF Balance of Payments Manual (BPM5) and under limitations as regards the availability of data.

Responsibility for the collection of the data necessary for b.o.p. compilation is shared between the Statistical Office of the Republic of Slovenia (SORS) and Banka Slovenije. Such data is collected through Slovenia’s International Transaction Reporting System (ITRS). Within the framework of the ITRS, the SORS is responsible for collecting trade statistics from customs declarations, while Banka Slovenije collects reports on other transactions between residents and non-residents. Stock data for the international investment position (i.i.p.) are collected exclusively by Banka Slovenije.

2.2 LEGISLATIVE PROVISIONS

(i) The Law on the Bank of Slovenia and subsequent amendments established the Bank’s independence and provide for it to collect the data needed for its operations.

(ii) The Law on National Statistics guarantees the confidentiality of individuals’ personal data and established the annual National Programme of Statistical Surveys, under the terms of which Banka Slovenije is obliged to publish b.o.p. data.

(iii) The Decree on the Obligation of Residents to Report Data on the Stock of Claims and Liabilities and Transactions with Non-residents provides for the confidentiality of individuals’ personal data.

2.3 INTERNAL ORGANISATION

Banka Slovenije is responsible for several sets of statistics provided by the Financial Statistics Department, which in turn comprises the following five divisions: the Monetary Statistics Division, the International Investment Division, the Financial Markets Division, the Statistical Methods Division and the International Credit and Payments Division. This last division is responsible for collecting data on transactions with non-residents settled via commercial banks. It also collects data on long-term loans and trade credits to and from non-residents, as well as short-term loans to and from non-residents. The International Investment Division, for its part, collects data on direct investment, short-term trade credits and accounts held by non-bank residents with foreign banks, as well as inter-company accounts with non-residents.

The Financial Statistics Department has a total of 49 staff, while the International Credit and
Payments Division has 17. The International Investment Division has 15 staff, five of whom are responsible for compiling b.o.p. and i.i.p. reports.

2.4 EXTERNAL COOPERATION

The SORS is an important external partner of the Financial Statistics Department. It provides the b.o.p. compilers with foreign trade statistics that are used to derive data for transactions in goods for the Slovenian b.o.p.

Sources for some estimates are the SORS and institutions in neighbouring countries.

2.5 USERS

B.o.p. and i.i.p. statistics are sent to internal users at Banka Slovenije and external users in Slovenia. The external users include the SORS, the Chamber of Commerce, the Ministry of Finance and some commercial banks.

The b.o.p. and i.i.p. data are also sent to the Organisation for Economic Co-operation and Development (OECD), the ECB, the International Monetary Fund (IMF) and Eurostat according to their respective standards.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The reporting system for the b.o.p. is the ITRS, which is a closed system. There is integrated reporting of the positions on non-resident accounts (these explain the changes in the assets or liabilities in the b.o.p.’s capital and financial accounts) and the transactions settled through these accounts (these principally explain the changes in the b.o.p.’s current account). In the reporting form, the position on each non-resident account at the end of the reporting period should equal the position at the beginning, plus the credit transactions minus the debit transactions. The transactions are classified on the basis of their description, as provided by the banks’ customers, and the assignment of a transaction code. There are more than 300 of these transaction codes and a list of them is available from Banka Slovenije on request. They form the basis of the methodology that allows banking forms (e.g. payment orders and forms relating to incoming payments) to be used in the compilation of b.o.p. statistics.

The main reporting pillars of the ITRS are:

(i) Reports on transactions settled between residents and non-residents via bank accounts (so-called non-resident accounts). These accounts comprise:
- the banks’ foreign correspondent accounts (nostro and loro accounts, including the central bank); and
- non-bank resident accounts abroad.

Transactions are classified using descriptions provided by the banks’ customers.

(ii) Customs declarations as the main source for recording merchandise (compiled by the SORS).

(iii) Reports to Banka Slovenije on registered credits granted and disbursed abroad.

(iv) Banka Slovenije accounting data.

(v) Commercial bank balance sheet data.

(vi) Data on direct investment (reinvested earnings).

(vii) Reports on goods sold to non-residents in duty-free and border shops.

Some estimates are used in the b.o.p. and i.i.p. for the valuation of data on imports, incoming travel, labour income, foreign exchange and deposits of resident households in foreign banks and debt forgiveness.
For the i.i.p., data are collected from residents’ reports on inward and outward direct investment, reports of enterprises on short-term trade credits and some of the other above-mentioned sources.

### 3.2 Reporting Agents

The b.o.p. and i.i.p. are compiled on the basis of reports from the following agents:

(i) **Commercial banks**, which report transactions between resident and non-resident entities (banks, enterprises, individuals, etc.) as well as transactions for their own account;

(ii) **Non-bank residents** report data on their accounts held abroad, on inter-company accounts with foreign partners and on the sale of goods in duty free shops. They also report short-term trade credits to and from non-residents;

(iii) **Residents** report inward and outward direct investment stocks and transactions;

(iv) **the SORS** provides data derived from customs declarations;

(v) **Banka Slovenije** provides its accounting data; and

(vi) **Residents** report data on loans and long-term trade credits to and from non-residents.

### 3.3 Thresholds

There is no special threshold for ITRS data.

**Frequency of reporting**

**Timeliness (deadline for submission after the end of the reference period)**
3.4 AVAILABILITY OF DATA

The b.o.p. is compiled monthly and disseminated no later than six weeks after the end of the reference month. Although the data have been available since 1988, only data for the key b.o.p. items are available for the period 1988-1993. Figures for the period 1988-1991 exclude transactions with the former Yugoslavia.

The i.i.p. is compiled yearly and disseminated no later than six months after the end of the reference year. Data have been available since 1994.

An advance release calendar is published on Banka Slovenije’s website (www.bsi.si) and in its Monthly Bulletin.

3.5 DATA CONTROLS

The first type of controls are computerised. They are installed on the reporting programs used by the reporting agents. These controls warn the agents of processing errors.

The second type of controls are performed within Banka Slovenije. They check the completeness of reports and their plausibility. If any data are missing from or incorrect in the reports, the reporting agents are contacted and the mistakes corrected. All discrepancies are checked directly with the reporting agent concerned.

The reports on flows are also compared with the external position of the reporting bank. With high-value transactions, a manual check is carried out.

The coding of data is also checked so that the flows and stocks are included under the correct item of the b.o.p.

3.6 REVISION POLICY

Revisions of b.o.p. and i.i.p. data occur as follows:

- revisions of monthly data are made with the release of:
  - the corresponding quarterly data;
  - the corresponding revised quarterly data;
  - the i.i.p. data for the corresponding year;
  - the revised i.i.p. data for the corresponding year;
- revisions of quarterly data are made with the release of:
  - the data for the following quarter;
  - the i.i.p. data for the corresponding year;
  - the revised i.i.p. data for the corresponding year;
- revisions of the annual international investment position are made with the release of the data for following years.

Banka Slovenije revises the annual b.o.p. data for the year t-1 when the i.i.p. data and the final goods data for the corresponding year become available (at the end of August). It also revises data for the year t-2. In the case of major methodological changes or discrepancies between data sources, data for the year t-3 will be revised as well.

3.7 DISSEMINATION

The data are first released on Banka Slovenije’s website (at http://www.bsi.si/html/financni_podatki for the Slovenian version and at http://www.bsi.si/html/eng/financial_data for the English version). They are subsequently distributed to all interested parties by fax or e-mail and are also published in Banka Slovenije’s Monthly Bulletin approximately one week later.

Detailed data on direct investment are published in Banka Slovenije’s annual publication “Direct Investment”.

Details of data users are given in Sub-section 2.5.
4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

As explained in Sub-sections 3.1 and 3.2, the main data source for imports and exports of goods are customs declarations. However, some goods cross the border without customs declarations. The data on these goods are collected through transaction reporting systems and questionnaires returned by duty-free shops.

4.2 DEFINITION

The definition of goods in the Slovenian b.o.p. complies with that given in the BPM5. Goods are classified as:
- general merchandise;
- goods for processing;
- repairs on goods;
- goods procured in ports by carriers; and
- non-monetary gold.

Coverage adjustments (for goods crossing the border without customs declarations) and valuation adjustments are made. A valuation adjustment is necessary because exports are valued on an f.o.b. basis and imports on a c.i.f. basis. Import data are therefore converted from a c.i.f. to an f.o.b. basis using a coefficient equal to the weighted average of coefficients between the c.i.f. and f.o.b. values of imported goods (for the available sample) and are calculated separately for each type of merchandise, means of transport and exporting country.

4.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

4.4 GAPS

The most significant gap is in the b.o.p. coverage of free-trading zones.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

Besides valuation adjustment (see Sub-section 4.2), there are no estimation methods used for the goods component of the b.o.p. current account.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

As explained in Sub-sections 3.1 and 3.2, the main data source for services is the transaction reporting in the ITRS. Some estimates are also included when compiling the services component of the current account.

5.2 DEFINITION

The definition of services in the Slovenian b.o.p. complies with that stated in the BPM5. Services are divided into:
- transportation;
- travel;
- communications services;
- construction services;
- insurance services;
- financial services;
- computer and information services;
- royalties and licence fees;
- other business services;
- personal, cultural and recreational services; and
- government services (only for imports).

Each of these items is subdivided further.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

There are some deviations in the services section of the current account.

Business travel exports are not recorded separately, but are included in the personal travel component.

</tbody>
</table>

1) Currently available only on an annual basis with a timeliness of 3 months after the reference year.
Short and long-term construction work is recorded under services. Long-term construction work is therefore not recorded as direct investment.

Exports of government services are included in other services.

Transaction reporting does not provide detailed enough data on transportation services. Therefore, in some cases, transportation services are overestimated, whilst in others they are underestimated.

5.4 GAPS

There are gaps in the coverage of exports of government services (e.g. expenditure of foreign embassies in Slovenia).

Similarly, coverage of transportation services is insufficient (see Sub-section 5.3).

5.5 INTENDED HARMONISATION

None.

5.6 ESTIMATION METHODS

An estimate of net sales of Slovene tolers (SIT) to non-residents in bureaux de change is used in the travel exports item, while estimates of the expenditure of Slovenian residents abroad are included in travel imports.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

Investment income relating to the Bank of Slovenia is recorded on an accruals principle.

6.1.1 COMPENSATION OF EMPLOYEES

As explained in Sub-sections 3.1 and 3.2, the ITRS is the main source of data on the compensation of employees. Since wages for seasonal and cross-border workers are not paid through domestic banks, an additional estimate is made for these receipts from neighbouring countries (Austria and Italy).

6.1.2 INCOME ON DIRECT INVESTMENT

As mentioned in Sub-sections 3.1 and 3.2, the ITRS is the main data source covering income on direct investment.

Reinvested earnings are derived from residents’ reports on direct investment and an offsetting entry is made for them under direct investment in the financial account. The reinvested earnings are included in the b.o.p. on monthly basis.

Income on equity and reinvested earnings are included in direct investment income, whereas income on debt (e.g. inter-company loans) is not.

6.1.3 INCOME ON PORTFOLIO INVESTMENT

As explained in Sub-sections 3.1 and 3.2, the ITRS is the main data source covering income on portfolio investment.

Income on debt (regardless of whether there is an FDI relationship) and income on equity (where there is less than 10% ownership) are included in portfolio investment income.

A breakdown by sector is available. This breakdown has four components: Banka Slovenije, government, banks and other.

6.1.4 INCOME ON OTHER INVESTMENT

As mentioned in Sub-sections 3.1 and 3.2, the ITRS is the main data source for income on other investment.

Income on other investment is broken down by sector into Banka Slovenije, government, banks and other.

6.2 DEVIATIONS FROM AGREED DEFINITIONS

As explained in Sub-section 6.1, the most significant deviation from the BPM5 in the Slovenian b.o.p. is for income on direct
investment, i.e. only total income on equity is included in income on direct investment and therefore income on debt is missing.

6.3 GAPS

None.

6.4 INTENDED HARMONISATION

None.

6.5 ESTIMATION METHODS

An estimation of workers’ income is made on the basis of data provided by neighbouring countries (Austria and Italy).

7 CURRENT TRANSFERS

See Section 8 on the capital account.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The ITRS is the main source for data on capital account transactions.

8.2 DEFINITION

The definition of the b.o.p. capital account complies with that given in the BPM5. Capital account transfers are classified under two sectoral components:

– government; and
– other sectors.

Current transfers, like capital transfers, are subdivided into two sectoral components:

– government; and
– other sectors.

Under other sectors, there are three groups of current transfers: first there are workers’ remittances, then there is insurance, and last there are other transfers. The main source for current transfers is also the ITRS.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Other sectors/other transfers are not covered in capital transfers.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The ITRS is the main source for collecting data on direct investment. Direct investment is therefore recorded on the basis of transaction reporting and data from customs declarations.

The source for reinvested earnings is yearly resident reports on direct investment.

9.2 DEFINITION

The definition of direct investment is in line with the recommendations set out in the BPM5. It is classified as:

– equity capital;
– reinvested earnings; and
– other capital.

The 10% ownership criterion is applied to distinguish direct investment from portfolio investment.

Reinvested earnings are derived from the yearly reports and are entered in the b.o.p. on a monthly basis (1/12 of the yearly value per month).
Inter-company debt transactions between affiliated enterprises (a capital share of 10% or more) are recorded as other capital transactions under direct investment in accordance with the BPM5. Until 2001, such transactions were recorded as loans and could not be recorded separately as direct investment when there was a direct affiliation between residents and non-residents. There is thus a break in series in the foreign direct investment and loan items of the b.o.p. as from 2001.

In the case of affiliated banks or financial intermediaries, only mutually subordinated claims and liabilities (i.e. permanent debt) are classified as direct investment/other capital.

9.3 DEVIATIONS FROM AGREED DEFINITIONS
See Sub-section 9.4.

9.4 GAPS
None.

9.5 INTENDED HARMONISATION
None.

9.6 ESTIMATION METHODS
Before the results of the annual surveys become available, reinvested earnings are estimated on the basis of the previous annual survey data.

For portfolio investment, two types of breakdown are available: one by sector and one by instrument.

Until 1997 only data on sales and purchases of debt securities through banks were included in this item. Since February 1997, equity securities without the characteristics described in Section 9 on direct investment have also been included in portfolio investment.

10.2 DEFINITION
The definition of portfolio investment complies with the recommendations set out in the BPM5. Portfolio investment in the b.o.p. is classified as:

– equity securities;
– debt securities; and
– money market instruments.

All of the categories listed above are also subdivided into sectors (government, banks and other).

10.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

10.4 GAPS
None.

10.5 INTENDED HARMONISATION
None.

10.6 ESTIMATION METHODS
None.
11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The main source for data on financial derivatives is the ITRS.

11.2 DEFINITIONS

The definition of financial derivatives in the Slovenian b.o.p. complies with that given in the BPM5. Financial derivatives are broken down by sector into Banka Slovenije, government, banks and other.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The ITRS is the main source for data on other investment. Other investment is therefore recorded on the basis of transaction reporting, commercial bank balance sheets, registered credits, Banka Slovenije accounting data, data from customs declarations and some estimates. The sources for short-term trade-credits are reports of enterprises on short-term trade-credits.

12.2 DEFINITION

The definition of other investment complies with the recommendations set out in the BPM5. Other investment in the b.o.p. is classified as:

- trade credits;
- loans;
- currency and deposits; and
- other assets and liabilities.

Furthermore, trade credits are subdivided into short-term and long-term credits.

Loans are recorded on a gross basis and are broken down by sector and maturity.

Foreign exchange and deposits and other assets and liabilities are broken down by sector, while those of the banking sector are also broken down by maturity.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

Data on repurchase agreements are recorded according to the underlying instrument.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

Estimates of net sales of foreign exchange to residents in bureaux de change are used in the other assets/other sectors item.
13  RESERVE ASSETS

13.1  SPECIFIC FEATURES OF DATA COLLECTION

Reserve assets are recorded on the basis of Banka Slovenije accounting data. As a monetary authority, Banka Slovenije is the only source for data on reserve assets. Reserve assets include accrued income.

13.2  DEFINITION

The definition of reserve assets is in accordance with the recommendations set out in the BPM5. Reserve assets in the b.o.p. are classified as:

- monetary gold;
- special drawing rights (SDRs);
- the reserve position in the IMF; and
- foreign exchange assets.

Foreign exchange assets are subdivided into foreign currency and deposits and securities. Transactions with residents are excluded.

13.3  DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4  GAPS

None.

13.5  INTENDED HARMONISATION

None.

14  INTERNATIONAL INVESTMENT POSITION

14.1  SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1  GENERAL

The i.i.p. methodology is based on the BPM5 recommendations.

The i.i.p. is compiled for all financial account items (direct investment, portfolio investment, other investment and reserve assets), except for financial derivatives. Assets and liabilities are compiled separately.

Data sources for the i.i.p. and b.o.p. are different for some items. For most items, the i.i.p. and b.o.p. can be reconciled.

14.1.2  DIRECT INVESTMENT

Data on direct investment are collected from residents’ reports on inward and outward direct investment. In accordance with the recommendations of the BPM5, this item comprises investment where direct investors own 10% or more of the equity capital of an enterprise. All claims on and liabilities to affiliated enterprises are included under direct investment in the i.i.p., except for short-term claims and liabilities of affiliated banks. In the case of affiliated banks or financial intermediaries, only mutually subordinated claims and liabilities (i.e. permanent debt) are classified as direct investment.

Data on investment by Slovenian enterprises in indirectly affiliated enterprises abroad, since 1996, been included in the direct investment abroad item (in cases where enterprises abroad with Slovenian direct investment hold 10% or more of equity in other foreign enterprises). In the direct investment in Slovenia item, data on investment by foreign enterprises in indirectly affiliated enterprises in Slovenia are included (in cases where Slovenian enterprises with foreign direct investment hold 10% or more of equity in other Slovenian enterprises).

Direct investment data are recorded at book value.

14.1.3  PORTFOLIO INVESTMENT

The definition of the portfolio investment component of the i.i.p. is principally that recommended in the BPM5. Portfolio investment is classified as equity securities and debt securities. Money market instruments and financial derivatives are not included in the portfolio investment component of the i.i.p.
Data on equity securities and other equity shares are available (as are data on direct investment) from residents’ reports on direct investment. However, these reports only include data where investors own less than 10% of an enterprise’s equity.

Data on debt securities are available from credit registration forms and commercial bank balance sheets.

In the portfolio investment component of the i.i.p., two types of breakdown are available: one by instrument and one by sector.

Portfolio investment data on equity are recorded at book value.

14.1.4 FINANCIAL DERIVATIVES
Data on financial derivatives are recorded according to the underlying instrument.

14.1.5 OTHER INVESTMENT
The definition of the other investment component of the i.i.p. is in line with that recommended in the BPM5. The other investment component is subdivided into trade credits, loans, foreign exchange and deposits, and other assets and liabilities.

The sources for short-term trade credits are reports of enterprises on short-term trade credits and inter-company accounts between residents and non-residents.

The sources for long-term trade credits and loans are credit registration forms and are the same for the i.i.p. and the b.o.p. In the i.i.p., claims and liabilities between affiliated enterprises are recorded under direct investment and are excluded from the items trade credits and loans.

Data sources for currency and deposits, other assets and other liabilities are bank reports and Banka Slovenije accounting data and are the same as those for the b.o.p.

The assets/foreign exchange and deposits/other sectors sub-item of the i.i.p. also includes estimates based on data from the Bank for International Settlements (BIS) on deposits of Slovenian households in banks in BIS member countries.

The other liabilities/other sectors sub-item of the i.i.p. includes data on contractual joint ventures.

Other investment is broken down by instrument, sector and maturity.

14.1.6 RESERVE ASSETS
The definition of the reserve assets component of the i.i.p. is in line with that recommended in the BPM5. They are classified as: monetary gold, SDRs, the reserve position in the IMF and foreign exchange assets. Claims on residents are excluded.

The only source of data for the reserve assets item is Banka Slovenije accounting data.

14.2 DEVIATIONS FROM AGREED DEFINITIONS
See Sub-section 14.3.

14.3 GAPS
Neither financial derivatives nor money market instruments are covered by the Slovenian reporting system.

14.4 INTENDED HARMONISATION
At present, the possibility of collecting data on financial derivatives is being explored.

A full reconciliation of the i.i.p. and the b.o.p. is planned.

14.5 ESTIMATION METHODS
See Sub-section 14.1.5.
This country information was drafted by Slovenia and subsequently amended and agreed with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Slovenia should be addressed to:

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Since 1 January 1993, Národná banka Slovenska (NBS) – as the central bank of the Slovak Republic – has been the institution responsible for compiling balance of payments (b.o.p.) and international investment position (i.i.p.) statistics. The Balance of Payments (BOP) Section of NBS’s Monetary Policy Department collects data from a variety of sources, including the banking sector, the Statistical Office of the Slovak Republic (SOSR), government ministries (such as the Ministry of Finance and the Ministry of the Economy), government agencies (such as the National Property Fund), stock market brokers and a large number of Slovak enterprises.

The b.o.p. is compiled monthly on a cumulative basis and is published in hard copy. Data are also disseminated through NBS’s website (www.nbs.sk) with a three-month lag. Reports are submitted to the Slovak Parliament twice a year. The data are compiled in Slovak koruna (SKK) and are also published in US dollars (USD). The collection and compilation methods are being adjusted to bring them into line with the recommendations of the 5th edition of the Balance of Payments Manual (BPM5) of the International Monetary Fund (IMF) and with European Central Bank (ECB) and Eurostat requirements. The i.i.p. is compiled on a quarterly basis.

The b.o.p., i.i.p. and reserve asset data are compiled and published according to various Acts of Národná banka Slovenska, independently of the general government.

2.2 LEGISLATIVE PROVISIONS

The data are compiled under the terms and conditions of the NBS Act (No 566/1992), with subsequent amendments, the Banking Act (No 483/2001), the Foreign Exchange Act (No 202/1995) and the internal NBS Rule No 34, amended in 1997.

(i) NBS Act No 566/1992
The NBS Act defines the independence of Národná banka Slovenska in deciding on statistical methodology and the form and timing of data dissemination.

(ii) Banking Act No 483/2001
The Banking Act defines the reporting requirements of commercial banks vis-à-vis Národná banka Slovenska.

(iii) Foreign Exchange Act No 202/1995
The Foreign Exchange Act with its subsequent amendments defines the reporting requirements for non-banking sector entities.

(iv) NBS Rule No 34
NBS Rule No 34 ensures the confidentiality of individual banks’ data and requires that only aggregate information be made available to the public.

2.3 INTERNAL ORGANISATION

The BOP Section of Národná banka Slovenska is responsible for conceiving, developing, compiling and analysing b.o.p. and i.i.p. statistics. The section is also responsible for providing data to international institutions, such as the IMF, the ECB, Eurostat and the Organisation for Economic Co-operation and Development (OECD). The BOP Section operates within the Monetary Policy Department.

The Statistics Department of Národná banka Slovenska is responsible for the collection of data for the purpose of compiling b.o.p. and other external sector statistics. It consists of four sections, all of which cooperate in the task of collecting and processing accurate and comprehensive data:

(i) The Banking Statistics Section is responsible for the collection, control and processing of money and banking statistical statements from commercial
banks related to transactions in domestic currency.

(ii) The Foreign Exchange Statistics Section is in charge of the collection, control and processing of money and banking statistical statements from commercial banks related to transactions in foreign currency.

(iii) The Non-bank Entities Statistics Section is responsible for methodological management and for the collection, control and processing of data from the Slovak corporate sector.

(iv) The Statistics for International Institutions Section is responsible for the collection, control, processing and dissemination of harmonised money and banking statistics.

The Treasury Department is responsible for compiling, controlling and processing data on the reserve assets of Národná banka Slovenska. In addition, flow data for NBS and government liabilities are reported by this department.

2.4 EXTERNAL COOPERATION

The SOSR provides Národná banka Slovenska with monthly data on foreign trade. These data are compiled in accordance with the BPM5 and individual data are obtained with geographical and commodity breakdowns according to the Standard International Trade Classification (SITC). Foreign trade figures are based on information from customs declaration forms. Since EU accession, Intrastat is being used by the SOSR.

The Ministry of Finance and the Agency for State Debt Management provides Národná banka Slovenska with data on the assets and liabilities of the general government sector.

The National Property Fund provides Národná banka Slovenska with data on non-resident investment in the Slovak Republic (for state-owned enterprises only).

The BOP Section of Národná banka Slovenska maintains regular contacts and addresses methodological, collection and compilation issues with other central banks (e.g. in Austria, Germany and the Czech Republic).

The BOP Section’s staff take part in several of Eurostat’s b.o.p. technical groups and have close contacts with the ECB and the OECD. B.o.p. methodological issues are discussed regularly with the Statistics Department of the IMF.

2.5 USERS

Data are first disseminated to the public via NBS’s website. The public are informed of this practice by a note in NBS’s monthly publication “Monetary Survey”. The data are published a few weeks later in the relevant issue of the monthly “Monetary Survey”, as well as in the “Statistical Information” publications and the “Annual Report of the NBS”.

Internally, the data are used and analysed by the Monetary Policy Department.

B.o.p. and i.i.p. figures are sent regularly to the IMF, Eurostat, the ECB, the OECD and other institutions, according to their particular requirements.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

B.o.p. compilation is based on a mixed system, which uses a combination of settlement data and surveys.

The cash-based settlements system, or the International Transactions Recording System (ITRS), is a closed system that captures all foreign exchange transactions that are conducted through the banking system. Data on individual transactions are supplied on a monthly basis by each of the commercial banks, classified according to a list of codes that cover
the current account, capital account and financial account, as well as transactions that do not fall within the scope of the b.o.p.

Data are classified according to the sector of the resident transactor unit – own account transactions of banks, non-financial enterprises, financial enterprises, insurance companies and pension funds, general government, self-employed individuals, non-profit institutions serving households, natural persons and non-residents. The coding list is updated every two years. Each commercial bank supplies detailed data on a monthly basis, transaction by transaction classified according to a detailed list of codes.

This is supplemented by information on transactions through accounts held abroad by enterprises, and from the beginning of 2004, accounts held abroad by individuals (who are required to register with Národná banka Slovenska). Data on transactions through accounts held by non-residents in the Slovak Republic are also collected.

Data on foreign trade are on an f.o.b. basis and are obtained monthly through the SOSR (Intrastat and Extrastat).

The monthly survey of enterprises covers approximately 4,500 enterprises. It covers all transactions as well as stocks of financial assets and liabilities. Reporting units are financial institutions other than banks, securities traders and non-financial enterprises. There is a threshold of SKK 1 million in holdings of assets or liabilities; this will be reviewed during 2005. The survey fully covers all enterprises that are above the threshold.

The quarterly and annual surveys of direct investment enterprises cover 1,500 direct investment enterprises. These enterprises are also included in the monthly survey. Breakdowns by geographical area and by sector of economic activity are obtained quarterly, and more detailed data are obtained on an annual basis, in particular for reverse investment and reinvested earnings. The annual survey was first conducted for the year 2002.

There is direct reporting by commercial banks of their own account transactions in both domestic and foreign currency with non-residents, as well as the respective stocks.

Transactions of Národná banka Slovenska, including those in reserve assets, are obtained directly from the Treasury Department of Národná banka Slovenska.

These data sources are supplemented in several areas:

- Commercial banks act as custodians for the non-resident holders of domestic securities and report activity related to these securities.
- Data on the disbursement and repayment of government borrowings are obtained directly from Národná banka Slovenska (which conducts these transactions on behalf of the Government). The Ministry of Finance provides data on the stock of government liabilities.

3.2 REPORTING AGENTS

(i) The SOSR reports data on Slovak exports and imports of goods, which are derived from customs declarations. The external trade data record the physical movement of goods, which are valued at market prices and recorded at the time they cross the frontier of the Slovak Republic. Since EU accession, data on exports and imports of goods among Member States are obtained from statistical reports of enterprises via Intrastat.

(ii) All commercial banks submit data to Národná banka Slovenska in the required format and time. For the purposes of b.o.p. compilation, commercial banks submit statements on foreign exchange income and payments to and from non-

Table 1 Reporting scheme for b.o.p. and i.i.p. data collection in Slovakia
residents in foreign and domestic currency, reports on transactions in and stocks of foreign currency and Slovak korunas, and statistics on non-residents’ holdings of securities in their custody departments.

(iii) Národná banka Slovenska reports data on reserve assets and the liabilities of monetary authorities and government (flow and stock data are available).

(iv) Slovak enterprises are direct reporting institutions. Each enterprise with foreign assets or liabilities exceeding SKK 1 million at the reference date is required by Slovak law (the Foreign Exchange Act) to provide Národná banka Slovenska with a monthly report on those foreign assets and liabilities. Currently, Národná banka Slovenska obtains data from approximately 4,500 enterprises.

(v) The Ministry of Finance provides Národná banka Slovenska with data on the assets and liabilities of the general government sector.

3.3 THRESHOLDS

Since EU accession, the reporting guidelines for banks include an exemption threshold for all customer transactions below €12,500. For the corporate sector, a threshold of SKK 1 million has been set, above which enterprises must submit a monthly report on foreign assets and liabilities.

3.4 AVAILABILITY OF DATA

B.o.p. data are compiled monthly in a cumulative form. Data are disseminated to the public no later than three months after the reporting period, with the exception of data dissemination to the ECB, in which case estimated or preliminary data are submitted within six weeks of the end of the reporting period.

Since 2001, the BOP Section has been compiling the i.i.p. on a quarterly basis. These data are disseminated no later than six months after the reference period.

Reserve assets are compiled on a weekly basis and the reference day is always Wednesday, or the preceding working day if the Wednesday is a public holiday. Data are published on the following Friday, or the next working day if the Friday is a public holiday. On a monthly basis, data are structured according to the new IMF Data Template on International Reserves and Foreign Currency Liquidity (the IMF Data Template) and disseminated no later than one month after the reference period. Following the ECB requirements, the Data Template is provided to the ECB within three weeks.

3.5 DATA CONTROLS

A number of validation procedures are in place.

- Trade statistics based on customs declarations are cross-checked with transactions reported by banks and by non-bank entities.

- The primary data source for most of the other current account transactions is the ITRS. For non-bank entities, these are checked at the aggregate level with survey aggregates. Aggregate results are cross-checked with customs data and trade credits (for goods) and with the enterprise survey (for income).

- The financial account data are derived primarily from the government transactions through Národná banka Slovenska and from the enterprise surveys. These data are cross-checked with the aggregate results from the ITRS and are also reconciled with the i.i.p. statements.

- Cross-checks between flows and stocks are performed for the commercial banks’ financial transactions. Time-series checks are performed for each bank and for each main item.
The financial press is monitored for information on relevant corporate activity and to verify high-value direct investment as well as other investment transactions.

Checks are also performed at the aggregate level to verify consistency with other statistics. For example, commercial bank statements are checked against enterprise surveys for selected items.

3.6 REVISION POLICY

The b.o.p. and i.i.p. data are revised every time new information becomes available. Owing to the eight-month lag in obtaining final data, the trade balance is revised periodically. Commercial banks and enterprises revise their end-of-year data four months after an internal audit has been performed.

3.7 DISSEMINATION

Data are first disseminated to the public via NBS’s website. The public is informed of this practice by a note in NBS’s monthly publication “Monetary Survey”. The data are disseminated a few weeks later in the relevant issue of the monthly “Monetary Survey”, as well as in the “Statistical Information” publications and the “Annual Report of the NBS”.

B.o.p. and i.i.p. figures are sent regularly to the IMF, Eurostat, the ECB, the OECD and other institutions, according to their specific requirements. The Slovak Republic is a subscriber to the IMF’s Special Data Dissemination Standard (SDDS) and disseminates metadata on the IMF’s Data Dissemination Bulletin Board with a hyperlink to the original data.

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

The international trade statistics in Slovakia are based on a special trade system. The statistics refer to all merchandise entering or leaving the Slovak Republic free circulation area and premises for inward processing. Included are non-monetary gold, oil, electricity, military goods, goods bought under financial leasing arrangements, barter trade, postal consignments subject to customs formalities and, as of January 1998, goods for processing. The main exclusion is migrants’ effects. Estimates are not made for unrecorded trade (e.g. smuggling and non-reported trade).

The Directorate of Customs of the Slovak Republic compiles monthly international trade statistics on a cumulative basis. Exports and imports are published on an f.o.b. basis. However, it is also possible to calculate trade data on a c.i.f. basis. Since EU accession, exports and imports of goods among Member States are monitored on the basis of monthly statistical reports of enterprises via Intrastat. The SOSR updates the register of enterprises yearly, using an exemption and a simplification threshold for exports and imports.

4.2 DEFINITION

Slovak foreign trade statistics on goods are compiled according to the BPM5, which means that data are divided into:

- general merchandise;
- goods for processing;
- repairs on goods; and
- non-monetary gold.

Data on Slovak exports and imports of goods are derived from customs declarations. The external trade data record the physical movement of goods, which are valued at market prices and recorded at the time they cross the frontier of the Slovak Republic.

Since EU accession, data on exports and imports of goods among Member States are obtained from statistical reports of enterprises via Intrastat.

A geographical breakdown of figures is available, as well as a commodity breakdown according to the SITC.

1) A monthly geographical breakdown is available only for the trade balance; for other current account and direct investment items, a geographical breakdown is available on a quarterly basis.
4.3 DEVIATIONS FROM AGREED DEFINITIONS

The current system records the data at the time the border is crossed, and not at the time of the change of ownership.

4.4 GAPS

International trade statistics do not fully capture goods (e.g. fuels, including bunker fuel) procured abroad by resident carriers and those procured in the Slovak Republic by non-resident carriers. These relate mainly to purchases of fuel by trucks.

4.5 INTENDED HARMONISATION

None.

4.6 ESTIMATION METHODS

Národná banka Slovenska does not make any estimates of trade statistics data, which are obtained from the SOSR.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Generally, data for services are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”. The first report contains transactions in foreign exchange, while the latter covers transactions in domestic currency. These reports are prepared by all commercial banks on the basis of the methodology prepared by the BOP Section. The commercial banks return the data electronically to the Statistics Department of Národná banka Slovenska. The reporting forms are designed on the basis of the BPM5 and also contain information needed by the compilers.

The data are collected on the basis of a system using specific transaction codes, under which income and payments have to be assigned the relevant code from a list.

5.2 DEFINITION

Data are compiled according to the BPM5.

(i) Transportation: data for transportation are generally obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”, and several items (among them pipeline transit) are directly reported by pipeline operators.

(ii) Travel: data for travel are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”. The collection system covers purchases and sales of foreign exchange and cashless payments (i.e. transfers from one account to another), as well as transactions via credit cards. As supplementary sources, Národná banka Slovenska uses data from border surveys produced by the Institute of Tourism and statistical information on travel from the SOSR.

(iii) Other services: data for this item are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

5.4 GAPS

None.

5.5 INTENDED HARMONISATION

Národná banka Slovenska is planning to approve and implement a survey system for non-banking entities covering selected services items to complement the current banking statement system.
5.6 ESTIMATION METHODS

None.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

6.1.1 COMPENSATION OF EMPLOYEES
Data for compensation of employees are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”. Estimates of transactions in compensation of employees, both credits and debits, are obtained from the SOSR. These cover both legal and illegal workers, Slovak resident employees of foreign embassies and non-residents working in Slovakia. Data are cross-checked with Eurostat, which is working on a project related to migration.

6.1.2 INCOME ON DIRECT INVESTMENT
Income on direct investment is recorded in the b.o.p., broken down into income on equity securities and income on debt securities (interest). Data for income on debt securities are divided into bonds and notes and money market instruments.

Data are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”. Data on income received by general government and Národná banka Slovenska are obtained from the Treasury Department of Národná banka Slovenska. Data are recorded on a cash basis. A geographical breakdown for portfolio investment income is available on a quarterly basis.

6.1.4 INCOME ON OTHER INVESTMENT
Data on income on other investment are available in a sectoral breakdown. Data are obtained from the “Monthly report on foreign exchange income and payments”, the “Monthly report on receipts and payments for the account of non-residents” and the monthly enterprise survey “Monthly report on foreign assets and liabilities”. Data on interest received and paid by Národná banka Slovenska and general government are obtained from the Treasury Department of Národná banka Slovenska.

6.2 DEVIATIONS FROM AGREED DEFINITIONS

Most interest is recorded on a cash basis.

6.3 GAPS

None.

6.4 INTENDED HARMONISATION

Národná banka Slovenska is planning to introduce a security-by-security reporting system in the coming years.

6.5 ESTIMATION METHODS

An adjustment is made to estimate the accrual of interest on government bonds denominated in
domestic currency using information from the Central Depository.

Data on transactions in compensation of employees in the ITRS are adjusted using statistical information on the number, the professional and territorial structure, and the nominal wages of Slovak workers abroad. Appropriate adjustments are made to other current account components.

7 CURRENT TRANSFERS

Data for current transfers are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”. The credit entries for general government cover amounts received under foreign technical assistance projects and humanitarian aid. Debit entries cover contributions to the administrative budgets of international organisations. The entries for other sectors include workers’ remittances, inheritances, alimony payments, gifts and pensions.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Data for capital transfers are derived from the same sources as data for current transfers and mainly include migrants’ transfers and investment grants received and extended. Transfers are broken down into government and other according to the institutional sector of the resident. Transactions under the PHARE technical assistance programme are included.

8.2 DEFINITION

Capital transfers are compiled according to the BPM5.

Data are obtained from the “Monthly report on foreign exchange income and payments” and the “Monthly report on receipts and payments for the account of non-residents”.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

Non-financial transfers are not recorded.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

Direct investment data are collected through three individual surveys, one monthly, one quarterly and one annual. Národná banka Slovenska has a list of approximately 1,500 respondents, which regularly return the required questionnaires.

In addition to these surveys, Národná banka Slovenska uses supplementary sources of information, such as commercial bank statements, the National Property Fund, company reports and the press for information on new investors.

In the monthly and quarterly surveys, the column structure includes:

- the position of assets/liabilities at the beginning of the period;
- credits and debits for assets/liabilities;
- exchange rate changes, price changes and other adjustments; and
- the position of assets/liabilities at the end of the period.
The row structure of both surveys contains direct investment abroad and direct investment in the reporting economy. The assets and liabilities under foreign direct investment (FDI) are broken down into:

- equity capital (claims/liabilities);
- reinvested earnings; and
- other capital (claims/liabilities).

The quarterly survey provides Národná banka Slovenska with country and economic activity breakdowns. The economic activity breakdown is in line with the International Standard Industrial Classification (ISIC).

The annual survey also provides Národná banka Slovenska with country and economic activity breakdowns, with more detail for reinvested earnings and reverse investment. The annual survey was first conducted for 2002.

The data on FDI are disseminated monthly via NBS’s website.

9.2 DEFINITION

The definition of FDI is in line with the BPM5 and with the recommendations of Eurostat and the OECD. This means that the principles listed below are followed in the recording of FDI:

- the 10% ownership criterion;
- the directional principle for FDI;
- the inclusion of inter-company financial transactions (borrowing and lending – loans and trade credits, and securities);
- data for special-purpose entities are not compiled separately; and
- reinvested earnings are included in FDI.

When recording direct investment transactions, the actual operation concept is applied.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

9.4 GAPS

Some gaps may occur in connection with the identification of indirect relationships.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Estimates are carried out only in the case of reinvested earnings. The data are revised according to the results of the annual survey.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on inward and outward portfolio investment are published monthly, broken down by instrument (into equity securities and debt securities). On the assets side, a breakdown by creditor sector is available for foreign securities owned by residents. On the liabilities side, a breakdown by issuer sector is available for Slovak securities held by non-residents. Data on portfolio investment are collected on an aggregated basis.

The data sources are as follows:

(i) the banking sector: data are obtained monthly from the report on transactions and stocks on non-resident accounts in foreign currency and the report on transactions and stocks on non-resident accounts in domestic currency. Národná banka Slovenska obtains supplementary information on Slovak securities held by non-residents (liabilities) from a special survey of commercial banks which provide custody services to non-resident holders of Slovak securities; data are
divided by sector of issuer (government, commercial banks, other sectors);

(ii) *other sectors*: the monthly survey of the foreign assets and liabilities of domestic enterprises is used as an additional source of information on portfolio investment stocks; and

(iii) *Národná banka Slovenska*: data on securities issued abroad by Národná banka Slovenska and the Government are obtained from the Treasury Department of Národná banka Slovenska.

Národná banka Slovenska defines portfolio investment according to the methodology of the BPM5. Portfolio investment includes equity securities and debt securities (which include bonds and notes and money market instruments).

**10.2 DEFINITION**

Národná banka Slovenska defines portfolio investment in accordance with the BPM5. Portfolio investment includes equity securities (shares, participation certificates and interim certificates) and debt securities (bonds and notes and money market instruments). Neither financial derivatives nor repurchase agreements (repos) are included in portfolio investment. Service charges and brokerage fees are recorded as services.

**10.3 DEVIATIONS FROM AGREED DEFINITIONS**

None.

**10.4 GAPS**

If a resident’s assets are sold directly by a non-resident custodian or bank, the portfolio investment collection system is unable to record such information.

**10.5 INTENDED HARMONISATION**

Národná banka Slovenska intends to introduce a security-by-security reporting system in the coming years.

**10.6 ESTIMATION METHODS**

None.

**11 FINANCIAL DERIVATIVES**

**11.1 SPECIFIC FEATURES OF DATA COLLECTION**

Data on financial derivatives are compiled using existing commercial bank statements and the enterprise survey. Statements report transactions on a net basis. Regarding the instrument breakdown, only options can be separately identified.

Financial derivatives are recorded at market values.

**11.2 DEFINITIONS**

Financial derivatives are recorded as a separate item of the financial account. Financial derivative transactions are treated in line with the BPM5, which means that transactions relating to options, futures, swaps and forwards are recorded.

**11.3 DEVIATIONS FROM AGREED DEFINITIONS**

None.

**11.4 GAPS**

Geographical and sectoral breakdowns of financial derivative transactions are not yet available.

**11.5 INTENDED HARMONISATION**

Národná banka Slovenska is planning to implement a full breakdown of financial derivatives by type of instrument.
11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Other investment data is collected according to the definitions of the BPM5 and is broken down primarily into assets and liabilities. Furthermore, a breakdown by sector (monetary authorities, general government, commercial banks and other sectors) and a breakdown by maturity (short versus long-term investment) are available.

For each sector, other investment is broken down into the following instruments:

– trade credits;
– loans;
– currency and deposits; and
– other assets/liabilities.

A breakdown by currency is available for Národná banka Slovenska only.

The data sources are as follows:

(i) Národná banka Slovenska: the Treasury Department of Národná banka Slovenska provides NBS’s foreign exchange position. Information on NBS’s liabilities is provided by the relevant units of Národná banka Slovenska;

(ii) the Government: information is provided by the relevant units of Národná banka Slovenska, which is the fiscal agent of the Government in the area of debt service. Národná banka Slovenska also receives supplementary information on assets from the Ministry of Finance;

(iii) commercial banks: these banks return monthly reports on transactions and stocks on non-resident accounts in foreign currency and monthly reports on transactions and stocks on non-resident accounts in domestic currency; and

(iv) other sectors: data from domestic enterprises are obtained from the monthly survey of foreign assets and liabilities.

12.2 DEFINITION

The other investment item is basically in line with the BPM5. Trade credits and repos are also included.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

A breakdown by country is not available.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The source of the data for reserve assets is the Treasury Department (Operations) of Národná banka Slovenska, which compiles and provides data on a daily basis. However, the data are disseminated to the international institutions and the public on a weekly basis and daily data are used only for internal analysis. The Treasury Department also provides breakdowns of reserve assets by type of instrument and currency.

13.2 DEFINITION

Reserve assets are those external assets that are readily available to and controlled by monetary...
authorities for the direct financing of payments imbalances, for indirectly regulating the magnitude of such imbalances through intervention in exchange markets to affect the exchange rate and/or for other purposes. This definition is fully consistent with the BPM5.

The reserve assets are under the effective control of Národná banka Slovenska and the position of central government is excluded from these assets.

The reserve assets consist of:

- **foreign exchange**: highly liquid, marketable and creditworthy foreign currency-denominated claims (consisting of currency and deposits and securities) on non-residents. Positions vis-à-vis residents and positions in domestic currency are excluded from the reserve asset data;
- **gold**: since 2002 the total volume of gold has been valued at the market price;
- **special drawing rights**;
- the **reserve position in the IMF**; and
- **other reserve assets**

Reserve asset data are compiled in accordance with the gross concept (i.e. no netting with monetary authorities’ liabilities) and published according to the structure of the IMF Data Template.

### 14 INTERNATIONAL INVESTMENT POSITION

#### 14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

**14.1.1 GENERAL**

The classification of the i.i.p. follows the recommendation of the BPM5 and corresponds to the standard presentation of b.o.p. statistics. The i.i.p. includes the stocks of financial assets and liabilities vis-à-vis non-residents. Data for assets and liabilities are recorded separately.

Since 2001, the i.i.p. has been compiled on a quarterly basis and is published on NBS’s website no later than six months after the end of the reference year.

**14.1.2 DIRECT INVESTMENT**

Direct investment stock data (on equity capital) are compiled on a monthly basis and published on NBS’s website. The breakdown by instrument is currently available on a monthly basis, but published on a yearly basis. Breakdowns by sector, country and economic activity are also available on a quarterly basis.

The data sources are as follows:

(i) the **banking sector**: banks send on a monthly basis a report on transactions and stocks on non-resident accounts in foreign currency and a report on transactions and stocks on non-resident accounts in domestic currency. A geographical breakdown for this sector is also available on a quarterly basis; and

(ii) **other sectors**: the monthly survey of the foreign assets and liabilities of approximately 1,500 domestic enterprises provides direct investment data. From this survey, Národná banka Slovenska obtains both transaction and stock data for all direct investment items (e.g. equity capital, reinvested earnings and other capital) according to the BPM5. The country and economic activity breakdowns of FDI are available through
a separate quarterly survey, which has the same structure for FDI items as a monthly report. The column structure of both enterprise surveys is as follows:

- the position of assets/liabilities at the beginning of the period;
- credits and debits for assets/liabilities;
- exchange rate changes, price changes and other adjustments; and
- the position of assets/liabilities at the end of the period.

The annual survey provides Národná banka Slovenska with country and economic activity breakdowns, with more detail for reinvested earnings and reverse investment. The annual survey was first conducted for 2002.

Coverage and concepts are in line with the definitions used in the financial account of the b.o.p. Valuation approaches depend on the availability of market values.

### 14.1.3 PORTFOLIO INVESTMENT

Data on portfolio investment stocks are compiled and disseminated quarterly, broken down by instrument (into equity securities and debt securities). On the assets side, a breakdown by creditor sector is available. On the liabilities side, while a breakdown by issuer sector is available, currency and geographical breakdowns are not available at present.

The data sources are as follows:

(i) the banking sector: data are obtained from monthly reports submitted by commercial banks on transactions and stocks on non-resident accounts in foreign currency and on transactions and stocks on non-resident accounts in domestic currency. Národná banka Slovenska obtains supplementary information on Slovak securities held by non-residents (liabilities) from a special survey of commercial banks which provide custody services to non-resident holders of Slovak securities; data are divided by sector of issuer (government, commercial banks, other sectors);

(ii) other sectors: the monthly survey of the foreign assets and liabilities of domestic enterprises is used as an additional source of information on portfolio investment stocks; and

(iii) Národná banka Slovenska: data on securities issued abroad by Národná banka Slovenska and by the Government are obtained from the Treasury Department of Národná banka Slovenska.

Národná banka Slovenska defines portfolio investment according to the methodology of the BPM5. Portfolio investment includes equity securities and debt securities (which include bonds and notes and money market instruments).

The stock figures in all the breakdowns are given at market values.

### 14.1.4 FINANCIAL DERIVATIVES

Data on financial derivatives are compiled on the basis of commercial banking statements and the enterprise survey.

The data sources are as follows:

(i) the banking sector: banks send on a monthly basis a report on transactions and stocks on non-resident accounts in foreign currency and a report on transactions and stocks on non-resident accounts in domestic currency; and

(ii) other sectors: the monthly survey of the foreign assets and liabilities of domestic enterprises is used.

Geographical and sector breakdowns of these stocks are not yet available.
Financial derivative stocks are recorded at their real values and are treated in accordance with the BPM5.

### 14.1.5 OTHER INVESTMENT

Data on other investment are collected according to the definitions of the BPM5. Other investment is primarily broken down into assets and liabilities. In addition, a breakdown by sector (monetary authorities, general government, commercial banks and other sectors) and a breakdown by maturity (short versus long-term maturity) are available.

For each sector, other investment is broken down into the following instruments:

- trade credits;
- loans;
- currency and deposits; and
- other assets/liabilities.

Breakdowns by currency are available for Národná banka Slovenska, general government and the banking sector.

The data sources are as follows:

(i) **Národná banka Slovenska**: the Treasury Department of Národná banka Slovenska provides NBS’s foreign exchange position. Information on NBS liabilities is provided by the relevant units of Národná banka Slovenska;

(ii) **the Government**: information is provided by the relevant units of Národná banka Slovenska, which is the fiscal agent of Government in the area of debt service. Národná banka Slovenska also receives supplementary information on assets from the Ministry of Finance;

(iii) **commercial banks**: these return monthly reports on transactions and stocks on non-resident accounts in foreign currency and on transactions and stocks on non-resident accounts in domestic currency; and

(iv) **other sectors**: data from domestic enterprises is obtained from the monthly survey of foreign assets and liabilities.

The column structure of all statements (except those from commercial banks) and surveys contains:

- the position of assets/liabilities at the beginning of the period;
- credits and debits for assets/liabilities;
- exchange rate changes, price changes and other adjustments; and
- the position of assets/liabilities at the end of the period.

Coverage and concepts are in line with the definitions used in the financial account of the b.o.p.

### 14.1.6 RESERVE ASSETS

The source of reserve asset data is the Treasury Department (Operations) of Národná banka Slovenska, which compiles and provides data on a daily basis. However, the data are disseminated to the international institutions and the public on a weekly basis and daily data are used only for internal analysis. The Treasury Department also provides the breakdowns of reserve asset data by type of instrument and currency.

The definition of reserve assets is fully consistent with the BPM5.

The reserve asset data are published according to the structure of the IMF Data Template.

### 14.2 DEVIATIONS FROM AGREED DEFINITIONS

None.

### 14.3 GAPS

Currently, coverage of the household sector is insufficient.
14.4 INTENDED HARMONISATION

None.

14.5 ESTIMATION METHODS

None.

15 CONTACTS

This country information was drafted by Slovakia in agreement with the ECB's External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Slovakia should be addressed to:

4.23 FINLAND

I ORGANISATION CHART
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Suomen Pankki – Finlands Bank (referred to in this chapter as the Bank of Finland) has been responsible for compiling Finnish balance of payments (b.o.p.) statistics since 1948. This responsibility was seen as natural because exchange controls were carried out by the Bank of Finland. The system for compiling statistics has altered over time to reflect the changing stance in the process of liberalisation with regard to capital movements, which took place during the 1980s. Exchange controls in Finland were abolished in full and the current types of b.o.p financial account surveys were introduced in 1991.

2.2 LEGISLATIVE PROVISIONS

Residents are obliged under Section 28 of the Act on the Bank of Finland (214/1998), which entered into force on 1 January 1999, to report all international transactions they undertake to the Bank of Finland. Failure to report such transactions may result in a fine.

2.3 INTERNAL ORGANISATION

Since 1 June 1999 the compilation of the ESCB statistics at the Bank of Finland has been centralised in the Statistics Department, with personnel of 55. Some 25 members of staff work in the field of b.o.p. statistics. They are divided into teams for the processing of data on banks and other financial institutions as well as securities trading, data on the corporate sector and direct investment and the compilation, estimation and information service. A separate division provides general systems design expertise for all statistical areas and economist activities.

2.4 EXTERNAL COOPERATION

There is a close relationship between the Bank of Finland, Statistics Finland and the Board of Customs in the compilation of various statistics. Statistics Finland prepares general economic statistics. The Bank of Finland focuses its statistical activities on the statistics compiled for the ECB. With regard to the b.o.p. and the international investment position (i.i.p.), this means that the Bank collects the financial account and investment income data as well as compiles and disseminates the statistics. Statistics Finland is responsible for the collection of data for the current account items, except for investment income. The scope of the cooperation is defined in a set of agreements covering also the b.o.p. area. The official foreign trade statistics produced by the Board of Customs are used in the b.o.p. as well as in the national accounts.

2.5 USERS

Data in line with the standard components of the IMF Balance of Payments Manual (5th edition, BPM5) are supplied to international organisations, such as the ECB, the European Commission (Eurostat), the OECD, the IMF and the BIS, on a regular basis.

At the national level b.o.p. and i.i.p. data are used by Statistics Finland in its national accounts. In addition, Statistics Finland and the Research Institute of the Finnish Economy (ETLA) operate as data distributors in that they distribute b.o.p. data, for instance, via their commercial economic databases. The data are also supplied to various organisations, such as the Ministry of Finance, research institutes and universities.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The Bank of Finland’s current data collection system for the b.o.p. and the i.i.p. was introduced in 1991. It is a pure survey-type system with emphasis on end-investor and issuer surveys. For the financial account, surveys have been the source of information since 1991; for the current account, time series
methods have replaced the settlement data in the preliminary monthly statistics as the collection of data on settlements ceased at the end of 1998. Trade statistics are compiled on a monthly basis by the Board of Customs.

The traditional surveys carried out by the Bank of Finland concern the foreign financial assets and liabilities of enterprises, banks, other financial institutions and the general government as well as direct investment, securities trading and custodian services. In the asset and liability surveys the b.o.p. and i.i.p. data are collected simultaneously, and the respondents have to reconcile stocks, flows and related income. An essential element in conducting surveys is the use of various targeted registers as frames for selecting respondents.

The Finnish b.o.p. compilation system is based mainly on monthly and annual data collection. Since 1994 it has been compliant with the BPM5 and has been reported to international organisations. Data on most of the b.o.p. components are collected on a monthly basis, e.g. trade account data, investment income data and data on most items in the financial account, including reserve assets. Data related to international trade in services, current transfers, compensation of employees and the capital account are only available on a quarterly or an annual basis. Statistics Finland collects data on transport and travel services quarterly and on other services annually. For compensation of employees, transfers and the capital account, some data are even available from administrative sources monthly, but Statistics Finland mostly employs annual data. The extensive travel and other services surveys are described in detail in the Statistics Finland publication entitled “Internationalisation of enterprises” (November 2003, pp. 68-76). The Bank of Finland uses various estimation methods to compile the monthly and quarterly preliminary figures on foreign trade in services and other items where high-frequency data are not available.

Financial stocks are produced simultaneously with the b.o.p. flows. The monthly stock data also serve as an important quality control tool for the registration of international capital flows, which allows the consistency between flows and stocks to be monitored.

The data sources as well as the estimation and compilation methods are described in more detail in Sub-sections 4 to 12.

3.2 REPORTING AGENTS

(i) Registers
The official register of enterprises and establishments is received from Statistics Finland on an annual basis. It contains information on around 300,000 enterprises and establishments. The frames targeted for various b.o.p. surveys are, however, structured on the basis of other information. A balance sheet database with information on the 7,000 largest enterprises in Finland is used for the purpose of maintaining the survey frames. The official register contains a sub-set of 700 consolidated enterprises and an indication of foreign ownership. The balance sheet data are acquired from the same tax authority as for the official structural balance sheet statistics. In addition, the Bank of Finland monitors mergers and acquisitions and cooperates with Statistics Finland in order to keep the targeted direct investment registers up to date. The Financial Supervision Authority maintains the register of financial institutions.

(ii) Corporate sector
The Bank of Finland maintains three different frames for financial account surveys for the corporate sector. These are for the financial statement surveys on FDI abroad and FDI in Finland, and the monthly/annual surveys on all assets and liabilities in the financial account. The survey frame for FDI abroad will be controlled by the frame survey for 2004.

</tbody>
</table>
The frame maintenance of the FDI in Finland survey has become easier since the registers contain also balance sheet data. This enables an appropriate auxiliary variable analysis. In addition, the estimation of the total population from the registers is now feasible. Moreover, the frame maintenance involves a continuous monitoring of changes in enterprise structures.

The frame for the monthly foreign assets and liabilities survey is limited in size, consisting of only some 500 enterprises to facilitate a cut-off selection of respondents. The respondents are selected using a quantitative measure of the relative importance of enterprise in b.o.p. statistics. The measure is a coefficient where the enterprises’ relative weight in each item (stock data) is combined with the share of each item in the total stock (assets plus liabilities). For 2004, the overall cut-off point (cumulative coverage) of the list of enterprises in the frame has been set at 90% in descending order by size. This results in 50 consolidated monthly respondents with a full-fledged form representing some 150 enterprises. The coverage in each item varies between 50% and 100%. The rest of enterprises with a positive coefficient within the frame are surveyed annually, employing a simpler questionnaire to make up a census.

The Bank of Finland conducts annual financial statement surveys on direct investment in order to collect the data on reinvested earnings and direct investment flows and stocks, especially stocks of equity assets. The direct investment data based on the monthly survey are revised according to the results of the annual surveys. The breakdowns of direct investment by geographical location and economic activity are based on the annual surveys. The annual surveys are subject to modernisation during 2004 and 2005. The new surveys are of a cut-off type, thus having fewer respondents and being less costly than the former stratified surveys. The cut-offs allow flexibility in the definition of the statistical unit: the respondents may choose whether they prefer to report on a consolidated basis or by single enterprise. They have to state which enterprises are covered by the consolidated report.

The annual survey of direct investment abroad has around 400 respondents, while the annual survey of direct investment in the domestic economy has 570. The same definitions and concepts are used in the monthly survey and in the annual direct investment surveys. The enterprises may participate in both and the forms are tailored to the respondents’ profiles to avoid an excessive reporting burden. Data on the statistically important mergers and acquisitions in the current year, which are not included in the survey, are requested from the Finnish counterparts in detail.

For trade credits, a larger number of enterprises must be surveyed at intervals of a few years in order to check the levels of data.

There are no major gaps in the reporting system. In the financial account, monthly data are complemented later with annual information, and no specific grossing-up procedures are employed for the flow data. In practice, the monthly flows provide a reliable picture of capital flows, since enterprises with small stocks seldom have flows. However, since the monthly data collection is based mainly on non-probability sample surveys of a changing reporting population, it is possible that the coverage in terms of respondents will soon become inadequate. The frame maintenance system must be adequate, and intensive cooperation with Statistics Finland and other register data providers is called for.
(iii) Financial institutions, government and households

The Bank of Finland conducts surveys on banks, other financial institutions and general government agencies. All banks, and most other financial institutions and general government agencies are covered. As from 2004, the MFI balance sheet and MFI b.o.p. data collections are unified. In this reporting mode, the monthly b.o.p. flows are derived from the stocks (unified with MFI balance sheet statistics) employing valuation information from the MFI balance sheets and other sources. Around 60 institutions participate in the survey on banks and other financial institutions and in that on securities brokers/custodians. Securities brokers report the foreign securities trade which they carry out on behalf of the domestic sectors. On the portfolio investment asset side, securities brokers’ reports on ownership stocks are the main source of data on households’ holdings and flows.

(iv) Monetary authority

The Bank of Finland (its Accounting Department) reports on the external monetary position.

(v) Customs and Intrastat

The commodity trade data are based on the official foreign trade statistics produced by the Board of Customs. The Board of Customs publishes the monthly global commodity trade figures split between the euro area and other countries within six weeks and all geographical details within ten weeks. The f.o.b.-f.o.b. calculations are based on a survey conducted by the Board of Customs.

3.3 THRESHOLDS

None.

3.4 AVAILABILITY OF DATA

B.o.p. statistics with a euro area/non-euro area breakdown have been available on a monthly basis since January 1999; more detailed breakdowns on a country-by-country basis are available as from January 2004. Historical data according to the BPM5 are available as from 1975, except for financial derivatives (these data are available only from 1994 onwards).

3.5 TIMELINESS

The respondents are obliged to reply by the 15th banking day after the end of the reference month. The processing of the financial survey data takes just below three weeks. The Board of Customs delivers its preliminary trade statistics approximately six weeks after the end of the reference month. All in all, there are only a few days for the overall quality assessment of the monthly data. The first preliminary data are published at the national level after submission of the data to the ECB.

3.6 COMPILATION FREQUENCY

The Finnish aggregate b.o.p. is compiled on a monthly basis and more detailed breakdowns are available quarterly and annually.

3.7 DATA CONTROLS

Survey data relating to major enterprises are compared with balance sheets and news on international mergers and acquisitions. Bilateral contacts with these enterprises have been intensified during recent years. As from January 2004, b.o.p. banking data will be based on the banks’ balance sheet data for MFI statistics. In addition, a procedure for comparison with supervisory banking data is in place, and some details not included in MFI statistics are collected from the supervisory data. An understanding of the behaviour of firms and banks and their financial statements is a necessary precondition for an effective quality control of surveys. Given the limited availability of financial statement data in the
corporate sector and the fact that data collection is generally completed over time, the Finnish b.o.p. statistics have inherent risks that preliminary figures may be biased and revisions skewed. Revision analysis and a continuous monitoring of economic events are important quality control measures. Outliers in time series and the behaviour of the errors and omissions item deserve special attention.

3.8 REVISION POLICY

Data previously published can be revised. Monthly preliminary data are revised during the following month and thereafter on a quarterly basis. Quarterly data are revised when the data for the next quarter are published. Following this, the revision timetable adheres to that agreed between European statistical bodies.

3.9 PUBLICATION

The Bank of Finland disseminates the monthly b.o.p. and net i.i.p. six weeks after the end of the respective month. Data are available in monthly statistical bulletins as well as on the website (www.bof.fi) and, in greater detail, in the Statistical Review of the Bank. More detailed data on the b.o.p., i.i.p. (assets and liabilities) and external debt, including a separate annual publication on direct investment, are published at annual intervals. Detailed data are available from public and commercial databases (Statistics Finland and the Research Institute of the Finnish Economy (ETLA)). Details of the data users are given in Sub-section 2.5.

Both the publishing and the revision timetables are available in advance on the websites of the Bank of Finland (http://www.bof.fi) and of Statistics Finland (http://www.stat.fi) and on the webpages of the IMF’s SDDS (http://dsbb.imf.org/sdds.htm).

The titles of the publications produced by the Bank of Finland on b.o.p. statistics are listed in Sub-section 13.1.

4 MONTHLY BALANCE OF PAYMENTS

4.1 AVAILABILITY OF MONTHLY B.O.P. DATA

The Bank of Finland can provide all requested monthly b.o.p. items data within 30 working days after the end of the month to which the data relate.

Most of the b.o.p. data are collected on a monthly basis. The response rate to the Bank of Finland monthly surveys is nearly 100%. Exceptions are the data relating to international trade in services, compensation of employees, current transfers and the capital account. Monthly information on reinvested earnings and other financial statement data are based on estimates.

The euro area/non-euro area breakdown was implemented in the survey system at the beginning of 1999 and the Step 3 breakdown as from 2004. For commodity trade data, a full breakdown by country is available for the second preliminary figures. Estimation is applied to the geographical breakdown of the other current account data in the monthly b.o.p.

4.2 ESTIMATION METHODS FOR MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

The Board of Customs is responsible for the compilation of the Finnish foreign trade statistics. For the b.o.p. statistics, the Bank of Finland converts trade data to a f.o.b.-f.o.b. basis according to the results of a recent survey carried out by the Board of Customs. The BPM5-based exports (f.o.b.) exceed the merchandise export values of the customs statistics by approximately 0.5%. For imports, the f.o.b. values are approximately 5.9% lower than the c.i.f. values in the customs statistics. For extra-euro area imports, the f.o.b. value is approximately 6% lower than the c.i.f. value.

The Board of Customs publishes monthly data in several steps. The preliminary aggregate trade statistics, with a split into extra-euro area and other countries but excluding both detailed
country and industry breakdowns, are published approximately six weeks after the end of the month to which they relate. Monthly statistics, including country and industry-level information, are published approximately ten weeks after the month to which they relate. The data are revised by month several times in the course of the year. The final annual data become available in May.

Military goods are treated as normal goods. Transactions under special Community programmes (Satellite, Airbus and others) are, in principle, treated as normal trade in goods. Making the geographical allocation can be problematic, however, and therefore these types of transaction must be reviewed case by case.

4.2.2 FOR SERVICES
The preliminary monthly data on international trade in services produced by the Bank of Finland are based on quarterly forecasts which are produced on the basis of structural time series models (STMs). The quarterly values for services are estimated on the basis of their historical share in total foreign trade. In addition, system (multivariate) time series modelling is applied in the process to judge the recent development of the trade in services. Relevant quantitative and qualitative indicators are used as explanatory variables in the system modelling. The aggregated quarterly estimates on services are interpolated to the monthly level using the cubic spline method.¹

Data are revised in two stages. The first revisions are made when the quarterly data become available. The preliminary estimates relating to transportation and travel are replaced by the actual data, and estimates concerning other services are revised accordingly. The other revision occurs in September when the annual data on other services become available.

Statistics Finland is responsible for compiling data on financial services. The first annual survey results will be available in the summer of 2004 for the statistical year 2003.

4.2.3 FOR THE INCOME ACCOUNT
The data on compensation of employees are available from Statistics Finland only on an annual basis. The monthly and quarterly figures are estimated by the Bank of Finland on the basis of historical data. Owing to the small weight of this item in the Finnish b.o.p., the simplest possible technique is used: compensation of employees is assumed to be at the same level as in the previous year. Neither trends nor seasonal effects are calculated. The euro area/non-euro area breakdown is based on historical data.

For investment income, see Sub-section 5.

4.2.4 FOR CURRENT TRANSFERS
The monthly preliminary estimation of current transfers is performed separately for private and public transfers. Owing to the small weight of private current transfers, the simplest possible technique is used: they are assumed to be at the same level as in the previous year. Neither trends nor seasonal effects are calculated. Data on public current transfers (central government only) are available from the Ministry of Finance and the central accounting function of the Treasury on a monthly basis.

The euro area/non-euro area breakdown of private current transfers is based on historical data. It is possible to obtain the geographical breakdown of public transfers by area.

4.2.5 FOR THE DIRECT INVESTMENT ACCOUNT
See Sub-section 3.2 for a general description of the system and Sub-sections 7 to 12 for detailed information on the compilation of data on direct investment, portfolio investment, financial derivatives, other investment and reserve assets.

¹ The cubic spline finds the monthly path which fits best between quarterly data points, constraining the sum of the three individual months to the published quarterly total. This generates a "smooth" series without any jumps which could occur between quarters if, for instance, a monthly series were derived simply by dividing each quarter into three equal months.
4.2.6 FOR THE PORTFOLIO INVESTMENT ACCOUNT
See Sub-section 3.2

4.2.7 FOR THE FINANCIAL DERIVATIVES ACCOUNT
See Sub-section 3.2

4.2.8 FOR THE OTHER INVESTMENT ACCOUNT
See Sub-section 3.2

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

5.1.1 GENERAL
The collection of investment income data is an integral part of the survey system described in Sub-section 3.2 and in Sections 7 to 12.

Reporting agents identify monthly investment income flows, and income on interest-bearing instruments is recorded on an accruals basis. On the assets side, a breakdown into income on euro area and non-euro area assets is available. Reporting agents are instructed to apply the creditor/debtor principle in the surveys.

The geographical breakdown (euro area/non-euro area) for investment income has been in a readily available format on a quarterly basis since 1994. Prior to 1999, however, this information (excluding direct investment income) was based on settlement data, so that the creditor/debtor principle cannot be applied. Instead, the country of settlement is used, which may be misleading and distorts the allocation in favour of major international financial centres.

Investment income is broken down further into:

- direct investment income – equities and debts;
- portfolio investment income – equities and debts (bonds and notes, money market instruments); and
- other investment income.

The definitions applied conform to the BPM5.

5.1.2 INCOME ON DIRECT INVESTMENT
Direct investment income data with a euro area/non-euro area breakdown of inward and outward investment are compiled on a monthly basis. Preliminary data on distributed dividends and interest on inter-company loans on an accruals basis are derived from the high frequency surveys on foreign assets and liabilities. Reinvested earnings and dividends distributed by foreign-owned enterprises in Finland are based on estimates by the Bank of Finland which are made before the final figures for direct investment income from the annual surveys become available. The results of the surveys are available within nine months of the end of the reference year.

In the annual direct investment surveys, respondents are requested to report both the total profits of direct investment enterprises and, separately, the capital gains and losses included in those total profits.

Quarterly and annual income data are consistent with monthly data. Annual income data are available by economic activity of Finnish investor/Finnish investee and by country of immediate foreign investee/foreign investor.

5.1.3 INCOME ON PORTFOLIO INVESTMENT
Reporting agents identify income on equities/CIIIs on a cash basis and income on bonds, notes and money market instruments on an accruals basis. A breakdown by sector is available for all instruments.

Income on equities:
For credits, reporting agents covered by the survey of securities brokers identify monthly income on the foreign assets (equities and CIIIs) in their custody. Other reporting agents identify

2 In principle, the split is available for backdata from 1986 onwards.
income on their own foreign assets. The income on CIIs is also reported on a cash basis, as the amounts are negligible. In practice, only income actually paid is currently recorded for Finnish residents’ investments in non-resident CIIs. However, the amounts outstanding on this item are insignificant and do not have impact on the level of income flows. Income related to resident CIIs’ assets and liabilities is estimated on the basis of investment stocks outstanding.

Reporting agents are furthermore required to divide the income according to the euro area/ non-euro area split.

For debits, the amounts reported in the survey of brokers are negligible, except in March and April when most Finnish companies pay out their dividends.

Income on bonds and notes and on money market instruments:

For credits, reporting agents in the survey of brokers identify monthly income on the foreign assets in their custody. Other reporting agents identify income on their own foreign assets. Bonds/notes and money market instruments are reported separately in the surveys, and a euro area /non-euro area split is required.

For debits, reporting agents in the survey of brokers identify monthly investment income debits on the foreign liabilities in their custody. Other reporting agents identify debits on their own foreign liabilities. In the case of the survey of brokers, estimation methods are applied to derive accruals (see Sub-section 5.6).

The accruals principle (based on stocks) is applied to both credits and debits on all debt instruments. For bonds/notes, reporting agents are instructed to accrue interest on their stocks monthly, taking into account discounts/ premiums on the issue price. Thus, accrued interest is based on effective (historical cost) interest rates, and flows/stocks are reported at market price (dirty price). The difference between the issue price and the nominal price in the case of zero-coupon instruments is also accrued during the life of the instrument. In the survey of brokers transactions are to be reported at market value, thus including interest accrued since the last coupon. Reporting agents also identify interest on a cash basis for quality control purposes.

Implied interest on repo transactions (or net interest in the case of coupon washing) is impossible to identify in the current reporting system, but there is reason to believe that this factor is not very significant in the Finnish b.o.p. Nevertheless, a project concerning the importance of repos in the Finnish b.o.p. is under way.

5.1.4 INCOME ON OTHER INVESTMENT

The respondents report interest on an accruals basis for all types of assets, including interest on loans to non-affiliated enterprises. The survey system does not collect information from private individuals because the amount of other investment income flows arising from the household sector is considered to be insignificant.

Leasing payments made according to the agreement are considered to include in the principal both repayments and interest, and they are reported in the monthly survey as described in the agreement. Income on trade credits is not recorded because, in practice, trade credits are payable without interest.

5.2 DEFINITIONS

The Bank of Finland primarily applies the recommendations of the BPM5 for investment income.

5.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

5.4 GAPS

None.
5.5 INTENDED HARMONISATION

None.

5.6 ESTIMATION METHODS

Direct investment:
The results of the surveys are available within nine months of the end of the reference year. The Bank of Finland estimates the yearly results of the direct investment enterprises. The figures related to the results of enterprises for the previous year are considered to be a proxy for the results in the current year. The developments in the global economy and any noteworthy changes in the population of direct investment enterprises are taken into account in the estimation as well. The monthly estimates of the results are calculated by dividing the yearly estimates by twelve. The monthly estimates of reinvested earnings are calculated by deducting monthly dividend payments from the monthly estimates of the results of direct investment enterprises.

Since the preliminary data from the annual surveys for the previous year are available within six months, the estimates of reinvested earnings for the first four months of the current year are based partly on the information derived from the monthly survey of the previous year and partly on the revenue forecasts made by the investment banks. The estimates are revised in September for the figures for the period from January to August. At the same time, when the monthly estimates of reinvested earnings for the current year are revised, the monthly data on all the direct investment income items for the previous year are revised to correspond to the annual data.

As for the dividends distributed by foreign-owned enterprises in Finland, the monthly survey is not very extensive. For this reason, the Bank of Finland estimates the dividends of foreign-owned enterprises for May and June (traditionally, dividends are distributed in these months), using the annual survey of foreign direct investment in Finland, with the previous year serving as a reference year.

Accruals on government bonds:
The State Treasury cannot report accrued interest on domestic currency-denominated bonds held by non-residents as the ultimate creditor is unknown. Therefore, the accruals on these serial bonds have to be estimated by the Bank of Finland.

The data on which the estimation is based are stocks held in custody, as reported in the survey on brokers. The estimation method is the historical cost method, as presented by the EMI. This method takes into account discounts/premiums in the issue price of a tranche, and thus implies the use of effective interest rates when calculating the accrued interest. Empirical evidence, as well as the practicality of the method, provided strong arguments in favour of adopting this approach for Finnish b.o.p. purposes.

The actual calculations based on the historical cost method are carried out using two files, one of which is designed to maintain a register of all tenders for any of the serial bonds in the market. The other file contains a record of the interest accrued on every individual tranche on a month-by-month basis. The interest accrued is calculated as compound interest, and thus takes into account the time which has elapsed since the last coupon payment.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION

Statistics Finland is responsible for the collection of capital account data. The data only partially cover the capital transfers of central government on a quarterly basis. Preliminary quarterly figures are adjusted if necessary when final annual figures become available.
6.2 DEFINITION

Current and capital account classifications follow the recommendations of the BPM5. The central government data are compiled on the basis of the State’s annual accounts, which makes it possible to identify current, capital and financial transfers between Finland and the EU. Debt forgiveness by the central government is recorded by the Ministry of Foreign Affairs.

The euro area/non-euro area breakdown is based on current information.

6.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

6.4 GAPS

As from 1999 data on capital transfers by the central government are available on a quarterly basis. No estimation methods for preliminary data have been developed owing to the small amounts involved and the high level of volatility.

6.5 INTENDED HARMONISATION

None.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION

Flows and stocks of inward and outward direct investment are compiled on a monthly basis. The preliminary figures are based on the monthly survey of foreign assets and liabilities and on the data on statistically important international mergers and acquisitions (purchase or selling price of at least €10 million) which are not covered by the monthly surveys. Before the results of the annual surveys are available, reinvested earnings and exchange rate and other valuation changes in equity assets are estimated.

The data from the annual direct investment surveys is used to improve the coverage of the preliminary monthly/quarterly flow and stock figures. In other words, the annual surveys provide the Bank of Finland with information on the stocks of inter-company loans and trade credits from the respondents not covered in the high-frequency surveys, and the corresponding flows of these items are estimated as a change in stocks. All those Finnish direct investors and foreign direct investment enterprises that, according to publicly available information, have been involved in an international merger or acquisition during the year are included in the annual survey. In this way, it is possible to check that all relevant mergers and acquisitions have been recorded in the flow figures.

Quarterly and annual flow data are consistent with monthly data. The monthly stock figures are calculated by accumulating monthly flows, exchange rate and other valuation changes starting from the preceding year’s closing stocks.

Annual flow and stock data are available by economic activity of the Finnish investor/investee and by country of the immediate foreign investee/investor within around nine months of the end of the reference year. Monthly and quarterly data have been compiled with a euro area/non-euro area breakdown as from the beginning of 1999. The geographical breakdown is based on the residency of the actual issuers (i.e. debtor/creditor principle). The geographical breakdown of historical monthly data can be estimated using the annual geographical data.

In the event that a change of ownership of a resident company from a non-resident to another non-resident direct investor is revealed by the survey, the change is, in principle, recorded both in the FDI stocks and in the corresponding b.o.p. flows.

Transactions settled through an exchange of shares are recorded at the time when the exchange of shares takes place.
Valuation of transactions settled through an exchange of shares is primarily based on the agreed price. In cases where there is no agreed price, the price quoted on the market is applied. Where companies are unlisted, book values are used.

### 7.2 Definition

The Bank of Finland applies the 10% principle for the direct or indirect ownership of the equity of an enterprise as the criterion for direct investment. So-called special purpose entities are defined as direct investment enterprises. Direct investment capital transactions are recorded on a directional basis. Cross-border transactions in real estate are included, based on an estimate.

The components of direct investment capital are equity capital, reinvested earnings and other capital. The item other capital consists of inter-company loans and trade credits. Trade credits have been recorded in direct investment as from the beginning of 1999. Earlier they were recorded under other investment.

Owing to the survey-based data collection, equity contributions without payment (i.e. the provision of real or financial assets) are also covered.

Both short-term and long-term inter-company loans are included in direct investment capital. To be more precise, the respondents are asked to report promissory note loans, leasing credits, subordinated loans equivalent to equity and those deposits in intra-group accounts that the respondent classifies as inter-company assets and liabilities in its own accounting as inter-company loans.

In the annual direct investment surveys, the Bank of Finland collects stock data on the possible inter-company debt securities outstanding at the end of the year. Reported inter-company debt securities have been insignificant in value and are therefore not included in the direct investment figures.

In the annual direct investment surveys data are also collected on any cross-participations of less than 10% existing at the end of the year. So far, there are few foreign direct investment enterprises which own shares in Finnish direct investor enterprises. Stocks of equity assets are based on the balance sheets of direct investment enterprises, i.e. the stocks are valued at book value.

### 7.3 Deviations from Agreed Definitions

None.

### 7.4 Gaps

None.

### 7.5 Intended Harmonisation

None.

### 7.6 Estimation Methods

See Sub-section 5.6 for the estimation methods for reinvested earnings.

**Estimation of monthly exchange rate and other valuation changes in equity assets:**

The Bank of Finland estimates monthly exchange rate changes in equity assets of outward investment using the annual data on the geographical breakdown of stocks of equity assets abroad. In addition, any large valuation changes originating from individual international mergers and acquisitions are estimated using the purchase or selling price of the shares and the latest balance sheet value of the shares.

**The estimation of direct investment in shares listed in Finland:**

The Bank of Finland will use the same data source as for other international mergers and acquisitions, i.e. publicly available information. There is a lot of information available, especially on companies listed in Finland. On the website of the Helsinki Exchanges the stock exchange bulletins of companies listed in
Finland are available. In these bulletins the companies are to report on all mergers and acquisitions. According to the Finnish Securities Market Act, the companies also have to report if the ownership or voting power of an individual shareholder exceeds or falls below 5%, 10%, 20%, 33%, 50% or 66%. If the date and the purchase or selling price are not mentioned in these bulletins, the Bank of Finland contacts the company. The market prices of shares can be used as estimates in the case of gradual investments. In addition, with regard to the annual direct investment surveys, the annual reports of all companies listed in Finland in which foreign ownership is at least 10% are examined (information provided by the Finnish Central Securities Depository).

In their annual reports companies publish the lists of their major shareholders at the end of the financial year. In this way, it is possible to check that all the relevant direct investment is included.

In the monthly data collection the respondents report all the data on purchases and sales of shares listed in Finland under portfolio investment. In order to avoid double recording, the Bank of Finland deducts the direct investment transactions in question from the portfolio investment figures.

The estimation of cross-border transactions in real estate:
Estimation of cross-border real estate transactions is based on historical data. The volume of this type of transaction is insignificant in the Finnish b.o.p.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

The collection of portfolio investment data is part of the general reporting system (see Subsection 3.2), which is based almost entirely on end-investor surveys (directed at non-financial companies, financial institutions and general government) and surveys of brokers. The highly concentrated nature of the Finnish banking and securities markets implies that good quality data are available from a relatively small selection. It is also worth noting that the reconciliation of stocks and flows is inherent in the high-frequency surveys to which all major institutions and enterprises respond.

The ISIN code is not used directly for the compilation of the Finnish b.o.p., although reporting agents use it when identifying securities for the euro area/non-euro area split. There is no ISIN security database available at the national level, and some reporting agents in the survey of brokers have encountered considerable difficulties in implementing the euro area/non-euro area split for certain instruments. This has been due to the ambiguity of the ISIN code regarding the issuer in the case of debt instruments. Therefore, a centralised securities database which is available to the reporting agents would be most welcome for the purposes of the Finnish b.o.p.

The euro area/non-euro area split is available for all portfolio investment assets, but not for liabilities. Reporting agents are required to break the assets in the surveys down according to the creditor/debtor principle on a monthly basis.

In the banking sector the monthly balance sheets of banks are used for quality control purposes.

8.2 DEFINITION

The Bank of Finland primarily applies the recommendations of the BPM5 for portfolio investment. The portfolio investment statistics include shares/participations in funds, bonds and money market instruments. Private placement loans are classified as loans and not as portfolio investment. Portfolio investment is broken down by sector and by euro area/non-euro area issuer, but not by country. Money

3 The assets split is not available for backdata.
market instruments were introduced into surveys at the beginning of 1994.

The reconciliation adjustment between stocks and flows takes place through exchange rate changes and other changes in the surveys. The item other changes includes price changes and it can be calculated as a residual item. All instruments (both flows and stocks) are to be reported at market value (dirty price in the case of bonds), and the offsetting entry for accrued interest is recorded monthly under portfolio investment in accordance with BPM5 recommendations. Recording practices for debt instruments take into account premiums/discounts on the issue price. Reporting agents are instructed to exclude service charges, fees and commissions.

As far as the Finnish money markets are concerned, banks’ certificates of deposit (CDs) are by far the most popular instrument, but they are mainly used in the domestic interbank market. From the Finnish b.o.p. point of view, Finnish government Treasury bills are the most important instrument, as they are actively traded in the secondary market. Moreover, commercial paper programmes issued by enterprises are apparent in the Finnish b.o.p. There are no significant problems regarding money market instruments in the Finnish b.o.p.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

None.

8.6 ESTIMATION METHODS

Accrued interest on government bonds:
The accrued interest calculated according to the principles described in Sub-section 5.6 (together with the accrued interest on foreign bonds, as reported by the State Treasury) is recorded monthly in the current account/investment income debits, with an offsetting entry in the portfolio investment credits. When the coupon is paid (reported in the survey of brokers in the case of serial bonds and by the State Treasury in the survey on government assets and liabilities in the case of foreign bonds), it is deducted from the b.o.p. bond stocks through portfolio investment debits. Finally, it is worth noting that the process produces not only quarterly and annual, but also monthly estimates of the accrued interest in the Finnish b.o.p.

Estimation of mutual funds’ monthly flows:
The monthly capital movements pertaining to mutual funds’ investments are based on the monthly mutual funds reports published by the Helsinki Stock Exchange. The data available from the Stock Exchange are on an aggregate basis. The Bank of Finland estimates the necessary geographical and instrument breakdowns on the basis of data received from Statistics Finland’s quarterly survey of all resident CIIs. The monthly estimates are revised to be consistent with the quarterly survey data when they become available.

Estimation of the government bond stock:
The end-of-month government bond stocks comprise two elements:

(i) the end-of-month foreign bond stocks, as reported by the State Treasury in the survey on government assets and liabilities. These stocks are given at market value and take account of the interest accrued/paid;

(ii) the serial bond stocks reported by brokers/custodians in the survey of brokers. The initial, reported stocks are given in terms of nominal value and do not take account of repos. The following two aspects have to be considered when estimating the ultimate adjusted stocks:
In the survey directed at securities broking firms only flow data are collected. These flow data cover, on the one hand, net payments related to derivative contracts entered into by residents on non-resident derivatives exchanges, classified according to the direction of the payments and the domestic sector involved. On the other hand, the data also cover net payments related to derivatives contracts entered into by non-residents on resident derivatives exchanges, classified according to the direction of the payments.

In line with the ECB recommendations, flow data for derivatives are collected on a net basis only. Payments related to derivatives assets are not distinguished from those related to derivatives liabilities in the surveys. Stock data are, however, basically collected on a gross basis. The net value of outstanding contracts at the end of the reporting month is broken down into gross positive market value (assets) and gross negative market value (liabilities).

The information collected for derivatives covers both exchange-traded and bilateral, OTC-type derivatives (e.g. options, warrants, subscription rights, futures, forward contracts, foreign exchange swaps and cross-currency interest-rate swaps). Interest rate instruments are, in principle, included in derivatives (and not in investment income). The respondents report only aggregated data on their derivatives transactions and stocks, and no breakdowns by instruments are provided. Based on earlier observations and experience, however, it is known that currency swaps linked to individual assets or liabilities have been the most common instrument category, especially for central government. As from 1999, instruments such as forward contracts and interest rate swaps have also become significant in the data (earlier they were excluded from derivatives). If considered necessary, special inquiries directed at the most important respondents are occasionally conducted to ascertain the breakdown of their derivatives by instrument. Geographical breakdowns are available as from 2004.
Regarding the issue of residency in the context of derivatives contracts, identifying the residency of the counterpart should pose no difficulties for respondents in the case of bilateral contracts. In the case of exchange-traded derivatives the decisive criterion has been stipulated as the residency (location) of the derivatives exchange/the clearing house in question.

As for margin payments, respondents have been instructed to report all non-repayable margin payments as derivatives transactions (to be included in net payments) if these can be distinguished. All repayable margin payments (including initial margins and option-style variation margins) and collateral deposits must, as stipulated, be reported as transactions in deposits. If repayable and non-repayable margin payments cannot be separated by the respondent, they will most likely be reported as transactions in deposits.

### 9.2 DEFINITIONS

The Bank of Finland follows the basic conceptual framework and methodology originally set out in the BPM5 and subsequently revised by the IMF. Nowadays both exchange-traded derivatives and OTC-type derivatives are included. Payments related to interest rate swaps and forward rate agreements (FRAs) are classified as transactions in financial derivatives (and are not recorded in investment income flows).

Transactions in derivatives cover, in principle, all payments related to option contracts as well as forward-type contracts (including swaps): payments at inception (option premiums), during the life of and at the close of contracts. Secondary market trades in marketable derivatives are included. The difference between the contract (or strike) price and the prevailing market price in the case of delivery of the underlying instrument in a contract is also classified as a transaction in derivatives. Non-repayable margin payments are included to the extent possible (see Sub-section 9.1).

The valuation of stock positions for derivatives is based on gross market values. Assets are defined as the sum of contracts with a positive market value (including purchased options), and liabilities as the sum of contracts with negative market value (including written options).

### 9.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no deviations from agreed definitions at the conceptual level, because the survey instructions for respondents are based on these definitions. In practice, however, it may not always be possible for respondents to follow the instructions in full. For example, in the case of delivery of the underlying instrument in a contract, some respondents find it very difficult to report the difference between the contract (or strike) price and the prevailing market price as a transaction in derivatives. Margin payments represent another example (see Sub-section 9.1).

10 OTHER INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Data are obtained via surveys on foreign assets and liabilities (see Sub-section 3.2). The respondents to monthly surveys report data on stocks (at the start and at the end of the reporting period), net changes, exchange rate changes and other valuation changes (not significant) during the reporting period. The smaller enterprises reporting annually supply only stock data. The compilation of annual statistics is also based on data derived from the monthly/annual surveys.

The stocks of import-related supplier credits and import advances are grossed up by a coefficient calculated on the basis of the results of a special enterprise survey. This survey is carried out every fifth year in order to check the overall level of import credits. The net changes for these trade credit items are computed as differences between stocks after the grossing-up procedure.

10.2 DEFINITION

The Bank of Finland applies the recommendations of the BPM5. Other investment includes loans, trade credits, currency and deposits, and other assets and liabilities.

Loans include promissory note loans (including private placements), financial leasing and repurchase agreements.

Trade credits include import-related supplier credits, export advances, import advances and export claims.

Credit accounts of companies are classified under other assets and liabilities, except for inter-company accounts, which are classified under direct investment. Short-term claims and liabilities between affiliated enterprises are also recorded under direct investment.

In the Finnish b.o.p., genuine repos and sell/buy-back transactions are recorded under collateralised loans. Under the current reporting system, reporting agents are not required to separate repos from other short-term activities.

As far as the Finnish repo market practices are concerned, the instruments used in repo transactions are usually Finnish government benchmark bonds. Sell/buy-back transactions are more commonly used than outright ones, but it has to be noted that there seems to be no clear distinction between the two in back-office confirmations. Thus, a crucial feature is that traders agree on the price, so that the ambiguous definitions do not cause confusion. Moreover, some market participants discourage their repo dealers from trading in bonds with a coupon due during the repo period.

When the Finnish repo markets were thinner, maturities were largely dictated by settlement day aspects, but now the need for various (longer) repo periods has grown. The popularity of one-week repos, in particular, has increased, but periods of one month or longer are not yet common.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Data collection forms part of the general reporting system (see Sub-section 3.2). The Accounting Department reports the data on reserve assets stocks monthly. The flows are derived from this data.

11.2 DEFINITION

According to the BPM5, the reserve assets comprise gold, special drawing rights (SDRs), the reserve position in the IMF, foreign exchange and other claims. This definition and the ECB recommendations of the Working Group on Balance of Payments and External Reserves Statistics are followed. The breakdown by instrument is available monthly for reporting to the ECB, but is not yet published nationally.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Data related to the international investment position (i.i.p.) are collected together with the flow data via monthly surveys. See Sub-section 3.2 for a general description of the data collection system of the Bank of Finland and Sections 7 to 11 for specific descriptions of direct investment, portfolio investment, financial derivatives, other investment and reserve assets data collection. Geographical details for the i.i.p have been collected via an annual survey since 2000, but will be added to high-frequency collections as from 2004.

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

Sveriges Riksbank (the Riksbank) is accountable to the Swedish Parliament as stated in the Constitution Act. This means that the Riksbank’s activities are governed by laws enacted by Parliament, in particular the Sveriges Riksbank Act. The Riksbank is administered by its Governing Board. The different departments of the Riksbank are supervised by the Board of Directors.

2.2 LEGISLATIVE PROVISIONS

The regulations on statutory reporting to the Riksbank for balance of payments (b.o.p.) statistics are laid down in Article 9, of the Sveriges Riksbank Act (1988:1385). The reporting obligations are set out in the Riksbank’s Statute Book, which lays down the rules for statutory reporting to the Riksbank for b.o.p. statistics. It is possible for the Riksbank to make changes to the Statute Book at short notice. The current reporting obligations (RBFS 2002:4) became effective on 1 January 2003, the date on which the Riksbank’s rules on statutory reporting to the Riksbank ceased to be effective (RBFS 1997:4). The reporting obligations have been adapted to reflect the changes in the reporting system.

2.3 INTERNAL ORGANISATION

The Riksbank has a new organisation effective from 1 June 2000. The current organisation comprises the following departments:

- the Financial Stability Department is responsible for overseeing and analysing payment system stability;
- the Market Operations Department manages the Riksbank’s foreign reserves and the RIX payment system. It implements monetary and exchange rate policy and is also responsible for the supply of banknotes and coins;
- the Monetary Policy Department is responsible for overseeing and analysing monetary stability, besides compiling and publishing the b.o.p., as well as money and banking statistics;
- the Administration Department is responsible for organisational and administrative matters, for personnel and planning as well as for accounting;
- the IT Department is responsible for the technical and logical structure of the Riksbank’s IT operations and for the operation of the computer and telecommunications network;
- the Secretariat of the Board is responsible for the legal aspects of the Riksbank’s operations;
- the Communications Department is responsible for the coordination of communication with the media, moulders of public opinion and the general public, as well as for the production of Riksbank publications. Further duties include internal communications;
- the International Department is responsible for the preparation, coordination and support of the participation of the Riksbank in international monetary and financial cooperation;
- the Research Department is responsible for conducting research in areas that are of relevance to the Riksbank’s duties and activities;
- the Internal Auditing Department has been mandated by the Governing Board to examine the activities of the Riksbank and to aim for an efficient operation and accomplishment of objectives; and
- the Risk Management Department.
The production of b.o.p. statistics takes place in the Monetary Policy Department (MPD). There are 70 staff in the MPD. The production of both b.o.p. statistics and money and banking statistics is undertaken by the Statistics Division, with 20 staff members, 17 of whom currently work on b.o.p statistics and three on money and banking statistics.

2.4 EXTERNAL COOPERATION

For b.o.p. statistics purposes, the Riksbank cooperates closely with other authorities in Sweden, but retains overall responsibility for their production. The Riksbank and Statistics Sweden (the Swedish National Institute of Statistics) liaise to compile data for the current account and capital account, in particular data on trade in goods, transportation, services and transfers. Statistics Sweden also compiles data on trade credits and non-financial sector other investment and financial derivatives. The two organisations discuss methodological issues and the development of the statistics in joint task forces. One of the most important tasks performed over the past few years has been the full harmonisation of definitions between the national accounts and the b.o.p. In addition, data exchange takes place between the Riksbank and Statistics Sweden, which are linked electronically.

There are regular contacts with data providers, especially with large banks and enterprises, and with data users, such as market players and analysts. Close and regular contacts are maintained with other European central banks, in particular those of the other Nordic countries (Denmark, Finland, Iceland and Norway); these contacts include annual “Nordcap” meetings on issues relating both to the b.o.p. and to money and banking statistics.

2.5 USERS

B.o.p. data are sent to the following international organisations: the Statistical Office of the European Communities (Eurostat), the ECB, the International Monetary Fund (IMF) the Organisation for Economic Co-operation and Development (OECD) and the Bank for International Settlements (BIS).

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

As from January 2003 the Riksbank no longer uses settlement data as a source of information for the b.o.p. On the contrary, the current data collection system for b.o.p. statistics is primarily based on surveys. A number of relatively stable items are estimated on the basis of quarterly sample surveys. The Riksbank collects monthly data on the most volatile items in the financial account by conducting monthly surveys aimed at the largest players.

The current account and the capital account are compiled on the basis of a quarterly sample survey that Statistics Sweden has been commissioned to undertake. Investment income and trade in goods are excluded from the survey. Exports and imports of goods are compiled monthly from foreign trade statistics. Investment income is compiled through a combination of estimates and monthly surveys.

The quarterly sample survey of services and transfers has replaced the previous monthly surveys and settlement system information. Capital transfers are included in the quarterly survey for the non-government sectors and, on an annual basis, for the government sector. The Riksbank has to a large extent compiled capital transfers through monthly surveys; these reports are now being collected by Statistics Sweden.

Data on financial derivatives and other investment of non-financial companies are also compiled, as of January 2003, quarterly by adding appendices to Statistics Sweden’s survey of “Corporations' financial assets and liabilities”.
Data on foreign direct investment, portfolio investment, financial derivatives (excluding non-financial companies), other investment (excluding non-financial companies) and reserve assets are compiled monthly on the basis of monthly cut-off surveys conducted by the Riksbank. In addition, the Riksbank estimates portfolio investment income. As a complement, two annual surveys are conducted by the Riksbank, one on foreign direct investment and the Co-ordinated Portfolio Investment Survey (CPIS).

In order to fulfil ECB requirements, some of the monthly b.o.p. data are estimated using a forecasting model. The estimates are made for trade in services and transfers. Financial account data are largely collected on a monthly basis. The Riksbank rarely estimates figures that are missing owing to late reporting. The estimation methods employed, which are described below, comply with the BPM5.

3.2 IMPLEMENTATION OF THE BPM5

Most of the adaptations needed to comply with the BPM5 were implemented in October 1997. Some aspects of the adaptation, namely the f.o.b./f.o.b. adjustment for the freight and merchandise items, are to be developed further at a later stage. For both items, Statistics Sweden will develop new methods which are more in line with the BPM5 requirements. Furthermore, the “full” geographical breakdown for financial transactions was implemented in January 1999, with the exception of the breakdown for debt securities issued by residents, which does not identify the country of the creditor. Data on financial transactions are being collected, with a breakdown into at least 20 countries as of this year.

Data for earlier periods have been revised and adapted to comply to a limited extent with the BPM5. For the current account, comparisons will be possible at an aggregated level. As a result, most b.o.p. data series before and after October 1997 are not fully comparable.

3.3 STANDARD COMPONENTS – QUARTERLY AND ANNUAL

The presentation of the Swedish b.o.p. complies with the IMF standard components (BPM5).

3.4 REPORTING AGENTS

The Riksbank receives the following b.o.p. reports:

(i) Monthly cut-off surveys
Under the Sveriges Riksbank Act, enterprises and individuals are obliged, upon request, to report all transactions with non-residents directly to the Riksbank on a monthly basis. One aim of the monthly surveys is to ensure, as far as possible, that reports are tailor-made with regard to the scale and type of foreign operations of the enterprises. The populations were originally targeted by means of settlement data. Enterprises are identified by means of an identification number. The following data are collected by the Riksbank:

- major players and all monetary financial institutions (MFIs) supply data on financial transactions as well as on stocks and investment income (with stock data on own issues of interest-bearing securities in domestic currency being based on custody reports) on an accruals basis (approximately 150 reporting agents);

- data on secondary market trade in securities are reported by intermediaries, including banks. These agents also supply data on debt securities held in their custody (60 to 70 reporting agents). Major players, other than intermediaries, report their trade with foreign counterparts directly, as well as stock data on securities not held in Swedish custody (75 to 100 reporting agents);

- data on financial derivatives and other investment are reported by the government and financial sectors (approximately 120 reporting agents). The reports cover flows and stocks. Data on derivatives include

In addition to the above-mentioned reporting forms, Sweden also has reporting on repo positions, and primary trade in equity, etc.
those within foreign direct investment (FDI) relationships.

- major players report financial transactions and dividends payable within direct investment relationships (approximately 150 reporting agents).

(ii) Annual surveys
The Riksbank conducts two major annual surveys. The first covers direct investment stocks and profits, while the second is the Co-ordinated Portfolio Investment Survey (CPIS).

Statistics Sweden collects and/or provides the following data:
(i) Surveys conducted by Statistics Sweden
Statistics Sweden conducts a quarterly sample survey on services and transfers. As from January 2003, Statistics Sweden collects information on other investment for the non-financial enterprise sector via a quarterly sample survey. The necessary b.o.p.-related items are included in an already existing survey of non-financial enterprises which has been carried out by Statistics Sweden for a number of years. Some of the cross-border transactions were already covered in the “old” survey and it proved possible, by adding a few more items, to reduce the reporting burden for the non-financial enterprises.

(ii) Other data collected by Statistics Sweden
Statistics Sweden also collects the following data:
- merchandise data on a monthly basis;
- quarterly data on sea transport;
- calculated adjustments of the basic trade statistics (Intra-Community Trade Statistical System (Intrastat) and Extrastat) on a quarterly basis (calculated by the National Accounts Section of Statistics Sweden);
- information on stocks of Swedish portfolio equities held by non-residents on the basis of a semi-annual survey; and
- quarterly data on trade credits, stocks and flows.

3.5 Thresholds
For the monthly surveys, a general rule of thumb is applied for the cut-offs so as to cover approximately 90% of the data in terms of stocks for each b.o.p. item. For portfolio investment, the aim is to have a higher coverage of at least 95%.

3.6 Availability of Data
Complete quarterly and annual b.o.p. data are available. Data on portfolio investment are available monthly.

3.7 Timeliness
For the purpose of fulfilling ECB requirements, the Riksbank compiles monthly b.o.p. data within seven weeks of the end of the reporting period. Estimations are made for the items in cases where only quarterly or annual data are collected.

3.8 Compilation Frequency
The Swedish b.o.p. is compiled on a quarterly basis. The main part of the financial account is still being compiled on a monthly basis.

3.9 Data Controls
Data go through numerous checking processes before being published. There are ordinary checks on format and integrity, etc. for all data received. In addition, there are several forms of regular quality controls on the data: current contacts with the respondents; comparisons between income and the corresponding stocks; the comparison of transactions and corresponding changes in stocks (e.g. securities
and loans). Comparisons are also made with other sources, e.g. banking statistics and newspapers.

3.10 REVISION POLICY

The revision policy of the Swedish balance of payments contains three elements:

Regular revisions
Each quarter, the data for the preceding quarter are revised. At the release of data for the fourth quarter, the whole year is revised. If necessary, earlier years are revised at the same time. Key items and portfolio investment are revised monthly so as to be consistent with the quarterly data.

Consistency with other official statistics
To the extent that other official statistics constituting an input to the balance of payments are revised, a corresponding revision is always made within the balance of payments. These revisions might therefore go beyond the regular revisions. This applies to the following statistics:

– merchandise trade;
– national accounts adjustments;
– sea transportation;
– trade credits; and
– income on direct investments (annual survey by the Riksbank).

The reason is a strong user requirement that the b.o.p. should not deviate from other openly available statistical sources.

Ad-hoc revisions of statistics collected by the Riksbank
Revisions are made when new data give a changed picture of the developments in the b.o.p. The reason is that users should be provided as soon as possible with statistics that give an accurate picture of the b.o.p. These ad hoc revisions regard mainly big financial transactions, such as direct investments. On rare occasions, current account transactions are revised for this reason.

3.11 PUBLICATION

The b.o.p. statistics are presented and commented on by the Monetary Policy Department in two different publications. A full account of the b.o.p., with comments, is published quarterly. The quarterly publication also contains biannual statistics relating to Sweden’s international investment position (i.i.p.). As a complement to the publication, time series on the b.o.p. are published on the internet. Data on portfolio investment are published on a monthly basis. In addition, statistics with stock data on non-residents’ holdings of Swedish interest-bearing securities are published monthly on the internet. The annual foreign direct investment (FDI) survey is also published and commented on in a separate publication. The Riksbank has also implemented the survey of Swedish portfolio holdings of foreign shares and debt securities, CPIS. This survey is carried out annually.

The titles of publications produced by the Riksbank concerning b.o.p. statistics are listed in Sub-section 13.1.

4 GOODS

Statistics Sweden collects and compiles merchandise trade data from customs data (extra-EU) and Intrastat. A survey of approximately 1,800 intra-EU traders (75% of the total intra-EU trade value) is carried out on a monthly basis. This survey enables Statistics Sweden to fulfil the timeliness requirements for the reporting of global trade data.

For extra-EU trade, imports are classified according to the country of consignment and exports according to the country of final destination. For intra-EU trade, imports are classified according to the Member State of consignment and exports according to the Member State of destination.

In order to comply with international recommendations, the valuation of imports is converted from a c.i.f. to a f.o.b. basis.

5 SERVICES

Statistics Sweden conducts a quarterly sample survey on services and transfers that covers 4,700 enterprises stratified by sector, economic activity, size and direction of services (i.e. imported or exported). The Neyman allocation method is used. Only the largest enterprises have to provide a geographical breakdown of services and transfers, while a less detailed questionnaire is sent to the smallest enterprises requiring them only to report the main b.o.p. items.

The sample is drawn from a population frame consisting of information from several different sources. The Value Added Tax (VAT) Register provides information on exports and imports of services. Foreign trade in goods statistics are also a source for the maintenance of registers, since all companies with goods exports and imports of more than SEK 1.5 million are included in the population frame. Within the sample survey of services and transfers, there is monthly reporting for travel services. The use of Swedish credit cards abroad and of foreign credit cards in Sweden is reported by credit card companies (approximately 15 reporting agents). Sales and purchases of banknotes and traveller’s cheques are reported by banks and other companies that trade in currencies with the general public (approximately 50 reporting agents). Monthly data on services are estimated by the Riksbank using a forecasting model.

6 INVESTMENT INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION

6.1.1 GENERAL
Income on financial assets and liabilities is broken down according to the standard components in the BPM5.

6.1.2 INCOME ON DIRECT INVESTMENT
This component includes all income on assets and liabilities between parties in a direct investment relationship and is broken down according to:

- dividends payable;
- interest; and
- reinvested earnings.

Reinvested earnings are calculated as the difference between total profit (consolidated data according to the COPC concept) after tax and dividends. While dividends are reported when payable, reinvested profits are allocated to the year in which the profit was earned and distributed evenly over the months. Interest rates have been reported on an accrual basis since October 1997.

The main sources of data on direct investment income are monthly surveys from major players and an annual survey of profits of direct investment companies.

Since total profits on direct investment income, and consequently reinvested earnings, are calculated with a considerable time lag, forecasts have to be made.

In line with the recommendations made by the Task Force on Foreign Direct Investment (TF-FDI), the following changes have been made to the data compilation:

- as from 2003, the consolidation of total profit covers indirect ownership links of more than 50%;
- the consolidated data are allocated to the immediate affiliate or parent company; and
- starting in 2004, dividends from exceptional capital gains are recorded in the financial account.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
A partly new system for portfolio investment income was introduced at the beginning of 2003. On the basis of monthly stock data,
estimates are made for dividends and for income from debt securities issued by non-residents. The estimation methods used are based largely on market valuation principles. By contrast, interest income from domestic debt securities denominated in Swedish krona is estimated on the basis of stocks at nominal value and the interest rates prevailing at the time of the issue. This estimation method results in interest income figures being very close to what they would be under the concept of historical cost valuation. For the greater part of the income item (i.e. for both equity and debt securities), estimates (calculations) are used. Specifically, the estimates of dividends now also cover reinvested dividends of unit trusts, etc.

In line with the BPM5, income on debt securities is calculated on an accruals basis.

For income on debt securities issued by residents, the data are based on both monthly reports and estimations. An estimate is made of accrued interest on Swedish krona-denominated instruments on the basis of detailed information from custodians. The interest income on Swedish debt securities denominated in foreign currency is collected by monthly surveys of Swedish issuers. The respondents are asked to report on an accruals basis and in accordance with their own bookkeeping practices. This implies that this part of interest income is based on the historic-cost principle, rather than on prevailing market rates.

6.1.4 INCOME ON OTHER INVESTMENT
Interest on loans, etc. has primarily been reported on an accruals basis since October 1997. Monthly cut-off surveys of all relevant sectors have been the primary source and supplemented with settlement data. As from 2003, data on income on other investment are entirely based on monthly cut-off surveys for the government and financial sectors, in combination with a quarterly sample survey for non-financial companies.

6.2 DEFINITIONS
In principle, the Riksbank has implemented the recommendations of the BPM5 and the harmonisation proposals made by the Task Force on Financial Flows and Stocks, which has now been succeeded by the Working Group on Balance of Payments and External Reserve Statistics.

6.3 DEVIATIONS FROM AGREED DEFINITIONS
Data prior to 2003 were partly based on settlement data and were, accordingly, not compiled on a full accruals basis. As from January 2003, no interest income is based on settlements data. The accruals principle is used, but the historic-cost principle, rather than market interest rates, is used for domestic securities. Data prior to 2003 do not cover dividends and reinvested dividends of unit trusts, etc.

6.4 GAPS
None.

6.5 INTENDED HARMONISATION
None.

6.6 ESTIMATION METHODS
In accordance with the description in Subsections 4.2.3 and 5.1.3, estimations are made on the basis of monthly stock data for equity income and for income on debt securities issued by non-residents.

7 CURRENT TRANSFERS
Data for current transfers are based on the quarterly survey conducted by Statistics Sweden (cf. Section 5 on services).
8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on the capital account are primarily compiled from Statistic Sweden’s quarterly survey on services and transfers. Within the scope of the survey, monthly data are collected on aid to developing countries and contributions from the EU.

8.2 DEFINITION

In principle, the Riksbank has implemented the recommendations of the BPM5 and the harmonisation proposals made by the Task Force on Financial Flows and Stocks, which has now been succeeded by the Working Group on Balance of Payments and External Reserves Statistics.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The Riksbank collects data on direct investment flows and stocks from two different sources:

(i) monthly cut-off surveys, which cover all FDI transactions from respondents with considerable stocks and transactions regarding loans, etc. The selection of respondents is based mainly on the annual sample survey on FDI stocks. All the largest players, including all banks and insurance companies, are covered.

(ii) information on stocks and reinvested earnings is obtained from an annual sample survey. The samples are stratified by size and sector. Classification by size is based on simulated direct investment assets computed as the most recent survey data for the direct investment asset plus the accumulated net flow up to the measurement date.

The current method of calculating reinvested earnings has remained essentially unchanged in the b.o.p. compilation system (i.e. monthly estimates, ex post information from the annual survey).

The geographical breakdown is based on the debtor/creditor principle.

In the event that a change of ownership of a resident company from a non-resident to another non-resident direct investor is revealed in the survey, the change is recorded, in principle, both in the FDI stocks and in the corresponding b.o.p. flows.

9.2 DEFINITION

The combination of the two data sources leads to a good coverage and quality of direct investment data. The 10% criterion is applied. The directional principle is used, but data are also compiled according to the assets/liabilities principle.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

In addition, for intra-group trade credits, a 50% ownership criterion is applied instead of the 10% criterion. All FDI data are in line with the BPM5 as from October 1997, with some minor deviations.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

The recommendations of the TF-FDI regarding treatments that are not already applied are
planned to be implemented in the next few years.

9.6 ESTIMATION METHODS
None.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION
In the b.o.p. data compilation system, data relating to the portfolio investment account are based entirely on monthly surveys, i.e. banks and brokers report aggregated transactions in which they have acted as intermediaries on behalf of customers and for themselves; major players report aggregated direct transactions with customers abroad, i.e. transactions executed without the intermediation of Swedish banks and brokers, aggregated transactions in securities issued abroad by the major players themselves, and information on repo transactions; custodians report monthly information on stocks and redemptions.

10.2 DEFINITION
A full breakdown by instrument of the portfolio investment account, in line with the BPM5, was introduced in October 1997.

For repurchase agreements and related instruments, the Riksbank compiles only so-called genuine repos as collateralised loans. Other related instruments – so-called non-genuine repos – are recorded as portfolio investment.

10.3 DEVIATIONS FROM AGREED DEFINITIONS
At present, no geographical breakdown is available for portfolio investment liabilities. For assets, a geographical breakdown is available as from January 2000.

10.4 GAPS
No data are available on bond lending.

10.5 INTENDED HARMONISATION
None.

10.6 ESTIMATION METHODS
None.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION
The Riksbank has been collecting data on financial derivatives since March 1995. The data are collected via monthly surveys of MFIs and other major players, among them the Swedish clearing house OM. As from January 1999 a full geographical breakdown based on the country of the counterpart has been included. As from 2003, Statistics Sweden collects data on financial derivatives from non-financial enterprises on a quarterly basis.

The transaction data are collected broken down by:

(i) option premiums;
(ii) the realised value of derivative contracts redeemed/matured; and
(iii) net flows of interest rate swaps and forward rate agreements (FRAs) and the interest part of cross-currency interest rate swaps (CCIRS).

The data on financial derivatives are collected in a highly aggregated form. Therefore, Sweden is not in a position to produce a breakdown by instrument other than those outlined in items (i) to (iii) above.

The data are collected and recorded on a gross basis according to the recommendations of the BPM5, i.e. net of all derivative instruments which indicate a realised profit for the reporting agent are reported as credits. Accordingly, all instruments which indicate realised losses are reported as debits.
Margin payments are included in the reported data, but data are not collected separately. Furthermore, the Riksbank is not in a position to distinguish between options-style and futures-style variation margin payments.

11.2 Definitions

In principle, the Riksbank has implemented the recommendations of the BPM5 and the harmonisation proposals made by the Task Force on Financial Flows and Stocks, which has now been succeeded by the Working Group on Balance of Payments and External Reserves Statistics.

11.3 Deviations from Agreed Definitions

Derivatives within FDI relationships are included in the data, but are not reported separately.

11.4 Gaps

None.

11.5 Intended Harmonisation

None.

11.6 Estimation Methods

None.

12 Other Investment

12.1 Specific Features of Data Collection

The Riksbank collects data on other investment flows, stocks and income from basically two different sources: monthly cut-off surveys of banks and other major players; Statistics Sweden collects the corresponding data for non-financial enterprises on a quarterly basis. Data on trade credits are also supplied by Statistics Sweden.

Data on non-financial enterprises’ financial derivatives and loans, etc., are collected by Statistics Sweden and incorporated in its regular survey of financial assets and liabilities of non-financial corporations. The survey is conducted on a quarterly basis and is aimed at a population of just over 10,000 companies that have a balance sheet total of more than SEK 20 million. A sample of 720 companies is drawn from this population, and this is sorted into ten strata, the upper four of which are fully covered. For the remaining six strata, a sample is drawn and is then grossed up.

It is primarily in the upper, fully covered strata that external items are to be found.

The Riksbank has access to the data of individual companies on all external items on the main questionnaire, i.e. including data that is not used for the b.o.p. This data will be useful for updating the Riksbank’s register of direct investment and portfolio investment. It will also be used for cross-checking direct investment data.

Data on trade credits are based on a quarterly sample survey designed for the financial accounts system conducted by Statistics Sweden. Data are broken down into intra group trade credits (to be recorded under direct investment) and others using the 50% ownership criterion. Before the outcome of the survey is available, estimations are made for trade credit stocks. No estimations are made for flows. As soon as the result of the survey is available, the figures are introduced in the b.o.p. statistics.

Life insurance claims and the non-service part of premiums are estimated on the basis of insurance transactions, as collected by Statistics Sweden in the quarterly survey on services and transfers.

For repos, bond lending and other related instruments, see Sub-section 8.
12.2 DEFINITION

In principle, the Riksbank has implemented the recommendations of the BPM5 and the harmonisation proposals made by the Task Force on Financial Flows and Stocks, which has now been succeeded by the Working Group on Balance of Payments and External Reserves Statistics.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

Since the above-mentioned survey on the non-financial sector is conducted on a quarterly basis, the Riksbank makes estimates in order to provide monthly figures for the ECB. The Riksbank judges this to be a fairly reliable procedure since the non-financial sector accounts for less than 10% of all Swedish sectors’ other investment stocks and flows. Another argument for estimated monthly transactions is that the volatility of other investment flows and stocks of the non-financial sector is far more stable than that of other sectors, i.e. the MFI sector.

Monthly figures on trade credits are estimated by the Riksbank.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on reserve assets are recorded on a transaction basis, using the Riksbank’s accounting records. Income is recorded on an accrual basis.

13.2 DEFINITION

According to the BPM5, reserve assets comprise gold, special drawing rights (SDRs), the reserve position in the IMF, convertible currency claims and the euro amount receivable from the ECB. All reserve assets of the Riksbank are readily available to (i.e. highly liquid, marketable and creditworthy) and controlled by the central bank, are held against non-residents and are denominated in foreign currency (i.e. in currencies other than the Swedish krona). Holdings of the general government are not included. The gross concept is applied, i.e. there is no netting of the central bank’s assets and liabilities.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION

Sweden’s i.i.p. is compiled by the Riksbank and published semi-annually with a time lag of seven weeks. Data are revised when new i.i.p. data are released. At the time of the first publication estimates are made for direct investment assets and liabilities, portfolio equity and trade credits. Definitions of the various instruments, etc. coincide wholly with those applicable to the b.o.p.

The Swedish i.i.p. consists almost entirely of pure stock data. However, accumulation of flows is used for the calculation of stocks relating to:
– private non-commercial real estate;
– life insurance and pension fund savings; and
– the repatriation of Swedish interest-bearing securities in foreign currency, i.e. Swedish investors buying Swedish debt securities from abroad.

The i.i.p. is reported broken down by assets and liabilities, and by instrument.

The Riksbank collects the majority of the statistics via monthly surveys of the major players and via annual surveys. Information on foreign holdings of Swedish portfolio equity and on trade credits is also obtained from Statistics Sweden. For the non-financial sector, data on financial derivatives, loans and banking account arrears as from January 2003 are obtained from Statistics Sweden. Data collection is supplemented by calculations for certain items.

The Swedish i.i.p. statistics were adapted to the international nomenclature (BPM5) in October 1997. Owing to insufficient underlying material, retrospective adjustment of data has only been possible to a very limited extent, which means that there are some breaks in the time series.

Most of the items of the Swedish i.i.p. are broken down geographically as from January 1999. At present portfolio investment liabilities and foreign exchange reserves are not allocated geographically.

14.2 DEFINITIONS

14.2.1 GENERAL

14.2.2 DIRECT INVESTMENT
Stock information on direct investment refers mainly to book values. However, the Riksbank has also developed a method of market valuation which is based on the price/earnings ratio of listed companies with a similar business structure. Stock information at market value was published for the first time in August 1999, as supplementary information to the official book values. The definitions of direct investment stocks are the same as those for the transaction data. This means, for example, that the 10% criterion and the directional principle are applied.

Statistics for direct investment are mainly based on three sources:

– sample surveys;
– calculations by the Riksbank; and
– Statistics Sweden (trade credits).

Sample survey
The Riksbank carries out an annual sample survey to measure on a consolidated basis direct investment stocks in the form of:

– equity capital; and
– loans and other capital provided and received in a direct investment relationship.

The survey also measures total profits from direct investment abroad and in Sweden in order to calculate reinvested earnings.

The results of the survey are presented in a special publication.

The outcome of the sample questionnaire becomes available after a time lag of around 11 months. Statistics are therefore supplemented with forecasts, mainly based on previous stock data supplemented with transaction data and adjusted for some valuation changes.

Following the recommendations of the TF-FDI, the Riksbank has implemented the following measures:

– as from 2003, the consolidation of equity stocks is done on the basis of 50% ownership for indirectly owned companies; and
– the data are allocated to the immediate affiliate or parent company.
Further adaptations to the TF-FDI recommendations will be made in the next few years.

Calculations – private non-commercial real estate
Private non-commercial real estate is included in the concept of direct investment, according to the international nomenclature. The statistics are based on calculated flows, which are accumulated to provide stock figures. These are adjusted to take account of both inflation and – with regard to private real estate abroad – exchange rate fluctuations.

Statistics Sweden – trade credits
Information on trade credits within direct investment relationships is obtained from Statistics Sweden, which bases the information on quarterly surveys.

As the information is obtained after a three-month lag, stocks are forecast by projecting the most recently available outcome.

14.2.3 PORTFOLIO INVESTMENT

Foreign equity
Every year the Riksbank carries out a survey with the aim of measuring the size of Swedish assets abroad in the form of foreign equity. Holdings of both individual shares and shares in foreign unit trusts are included in the results of the study. As from 2001, this information is obtained from the annual CPIS survey.

For compilations produced at times when survey results are not available, forecasts are made on the basis of previous stock and transaction data, which are adapted to take account of changes in foreign stock prices and exchange rates.

Swedish equity
Information about the size of foreign holdings of Swedish equities is obtained from Statistics Sweden, which sends a semi-annual questionnaire to the Swedish National Numbering Agency and Swedish deposit managers. Forecasts are made in the same way as for foreign equity.

Foreign interest-bearing securities
Information about Swedish holdings of interest-bearing securities with foreign issuers is based on monthly reports from Swedish deposit managers and from players holding paper deposited abroad. Data are stated in terms of market value. This information is also compared with the annual CPIS survey, which is based entirely on end-investor information. For the time being, the monthly stock information, rather than the CPIS results, is being used in the official i.i.p.

Swedish interest-bearing securities
Statistics on the foreign holdings of interest-bearing securities with Swedish issuers are based on monthly reports from players who have issued securities abroad. This information is completed by using monthly reports from deposit managers on Swedish krona-denominated securities that are held in Swedish custody. Finally, securities that serve as collateral in repo agreements are added to the stock. A method to calculate market values for all interest bearing securities denominated in Swedish crowns has recently been developed. As from 2001, data are stated in terms of market values.

14.2.4 FINANCIAL DERIVATIVES

Stock information for financial derivatives is mainly based on monthly reports from the largest players and is recorded on a market valuation basis. Information on financial derivatives for the non-financial sector is obtained from Statistics Sweden and is based on a quarterly survey. Information is reported in aggregate, i.e. not broken down by the type of instrument.

The data are reported on a gross basis, as recommended in the IMF manual.

From January 1999 onwards, a full geographical breakdown by counterpart country is collected.

Financial derivatives within direct investment relationships are recorded under financial derivatives and not under direct investment.
### 14.2.5 OTHER INVESTMENT

**Trade credits**
Statistics Sweden compiles statistics on trade credits on the basis of a quarterly survey. Intragroup trade credits are reported under direct investment.

**Loans, etc.**
Data on loans, etc. (including deposits, financial leasing and repos) are mainly based on monthly reports from major players. Statistics Sweden compiles statistics on loans and banking accounts for the non-financial sector on the basis of a quarterly survey.

**Other**
Interim items (transactions contracted, but not settled), certain assets and liabilities in relation to international organisations and insurance saving are reported under the sub-item other.

The sub-item is based on monthly reports and, to a minor extent, on accumulated flows.

**Insurance saving**
Saving in the form of life insurance and pension fund savings is calculated on the basis of accumulated transactions, corrected for exchange rate and stock exchange price movements and the level of interest rates. Data on transactions are obtained from Statistics Sweden.

### 14.2.6 RESERVE ASSETS

Data on reserve assets are based on the Riksbank’s report on holdings of gold and foreign assets. These data are available on a monthly basis. All items, including gold, are recorded at market prices.

### 14.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

### 14.4 GAPS

None.

### 14.5 INTENDED HARMONISATION

None.

### 14.6 ESTIMATION METHODS

None.

### 15 ADMINISTRATION

#### 15.1 TITLES OF PUBLICATIONS

- Balance of payments (quarterly b.o.p. data and semi-annual i.i.p. data with comments and charts).
- Cross-border trade in securities (monthly statistics with commentary).
- Direct investment companies (annual statistics with commentary).
- Swedish portfolio holdings of foreign securities (annual statistics with commentary).

All the reports are available free of charge in Swedish and English and can be ordered from the Riksbank’s Information Centre; the data are also available on its website (http://www.riksbank.se). Some information is also published by Reuters.

Data on the following are available, but are only published on the internet:
- non-residents’ holdings of Swedish interest-bearing securities (monthly stock data);
- non-residents’ repo positions in Swedish interest-bearing securities (monthly stock data);
- direct investment, by country;
- trade with non-residents in Swedish portfolio shares; and

2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The compilation of the United Kingdom’s balance of payments (b.o.p.) is carried out on the basis of data submitted to both the Office for National Statistics (ONS) and the Bank of England, with the ONS responsible for compiling the overall aggregates. The ONS collects data from non-bank financial institutions and is the government agency responsible for compiling, analysing and disseminating most of the United Kingdom’s economic, social and demographic statistics, including the national accounts, retail price index, trade figures and labour market data, as well as a periodic census of the population and health statistics. The Bank of England collects data from UK banks and is responsible for compiling banking and money supply data.

2.2 LEGISLATIVE PROVISIONS

(i) ONS
The ONS was formed in April 1996 following a merger of the Central Statistical Office and the Office of Population Censuses and Surveys. On 7 June 2000 the United Kingdom launched “National Statistics” as the new framework under which economic and business data would be collected for statistical purposes only, under the Statistics of Trade Act. This Act sets out the need for timely and accurate data. Statutory penalties are available, where necessary, under the Statistics of Trade Act. Data on trade in goods are collected by the Board of Customs and Excise and supplied to the ONS.

The National Statistics Code of Practice sets out the key principles and standards which official statisticians, including those of the ONS, are expected to follow and uphold. It will be supported by twelve Protocols which describe how those principles and standards are to be implemented in practice. All of these documents are issued for public consultation prior to publication (http://www.statistics.gov.uk/about_ns/cop/default.asp).

(ii) Bank of England
The Bank of England Act 1998, which came into force on 1 June 1998, gives the Bank the power to obtain information (principally from monetary financial institutions (MFIs)) for the purposes of its functions in relation to monetary policy. The scope of information relevant for this purpose is set out in secondary legislation pursuant to the Act. In essence, the coverage is the same as in the previous, long-standing, voluntary arrangements to supply data for macroeconomic purposes, including data related to the money supply and the b.o.p., and for the preparation of the national accounts. The Act also allows the UK regulatory body, the Financial Services Authority (FSA), to require supervised institutions to report prudential supervisory information to the Bank acting on its behalf. As with the Statistics of Trade Act (see above), statutory penalties are available, where necessary, under the Bank of England Act.

The arrangement between commercial banks, as represented by the British Bankers’ Association, and the Bank of England to supply financial statistics originated following widespread acceptance within the financial community of the 1959 report by the Parliamentary Committee on the Working of the Monetary System (known as the Radcliffe Report). The report contained a
recommendation regarding the publication of statistical information necessary for an understanding of the financial positions of the main sectors of the economy. A regime of regular statistical reporting by commercial banks to the Bank of England was introduced in 1963 and was based on a quarterly (now monthly) balance sheet.

2.3 INTERNAL ORGANISATION

(i) **General**

The ONS and the Bank of England work closely together on a number of issues. The relationship exists not only with respect to the b.o.p., which is part of a larger overall process culminating in the production of the UK national accounts, but also in relation to macroeconomic issues. The ONS and the Bank of England have joint statistical work programmes and there are both formal and informal mechanisms which enable this cooperation to work successfully.

The formal mechanism is the “Firm Agreement”, which was drawn up to define clearly the responsibilities of both institutions, including timetables, deadlines and joint representation at international meetings.

The informal mechanism involves high levels of communication in terms of frequent liaison meetings between representatives of the ONS and the Bank of England. The two institutions exchange information regularly and discuss their respective work programmes in detail.

(ii) **ONS**

The ONS is the official b.o.p. compiler for the United Kingdom. The collection and compilation of statistics are carried out separately. The Newport office of the ONS Surveys and Administrative Sources Directorate (SASD) is responsible for the preparation of surveys and for the actual data collection. The Balance of Payments and Financial Sector (BoPFS) Division of the ONS, located in London, is responsible for producing and developing statistics for the rest of the world (RoW) and the financial sectors of the national accounts, including the compilation and publication of b.o.p. statistics. In addition, the BoP Co-ordination Branch within the BoPFS Division is responsible for taking the lead for the United Kingdom in liaison with the European Commission (Eurostat), the ECB and the International Monetary Fund (IMF) on b.o.p. issues in general. In particular, its Head of Branch is a UK representative in the Working Group on Balance of Payments and External Reserves (WGBP&ER), together with a representative from the Bank of England.

The BoPFS Division is part of the National Accounts Group (NAG) within the Macroeconomics and Labour Market Directorate (MLD), which is responsible for the national accounts. As the b.o.p. forms an integral part of the national accounts, the BoPFS Division of the ONS cooperates very closely with other Divisions within the NAG. There are both formal and informal links between the NAG and the SASD, with many shared work programmes.

(iii) **Bank of England**

The Bank of England collects the data on the banking sector used in the b.o.p. and in the national accounts. The Bank also supplies b.o.p. data on reserve assets and official liabilities obtained from administrative sources within the Bank. The Monetary and Financial Statistics Division (MFSD) of the Bank of England is responsible for providing statistics. The Financial Statistics Group deals specifically with b.o.p. statistics for the MFI sector (current account and direct and portfolio investment in the financial account) and for reserve assets and
official liabilities. The remainder of the contribution of the MFI sector to the UK b.o.p. is drawn from data processed elsewhere in the Division primarily for other purposes. The Bank also liaises with the FSA, for example, in the event of the repeated late submission of survey forms.

The Bank of England provides the ONS with support both in discussions on data for the banking sector, the provision of data and advice on capital markets, and in its attendance at international b.o.p. meetings, for example at meetings organised by the ECB and the European Commission (Eurostat).

2.4 EXTERNAL COOPERATION

The ONS is an executive agency independent of any other government department and is accountable to the Chancellor of the Exchequer. Within the National Statistics framework, it works in partnership with other entities within the Government Statistical Service (GSS) located in many government departments. The overall objective of the ONS is to provide Parliament, the Government and the wider community with the statistical information, analyses and advice needed to improve decision-making, stimulate research and inform debate.

The reporting burden for data suppliers is kept to a minimum. To this end, extensive use is made of some external data suppliers:

(i) Bank for International Settlements (BIS) data are used to estimate bank accounts (deposits and borrowing) abroad (for the non-bank sector);

(ii) government official records are used to provide information on government services and transfers; and

(iii) some bilateral counterparty data are used to provide information on private transfers.

Data for private sector loans from the European Investment Bank (EIB) are sent directly to the ONS.

2.5 USERS

The ONS and the Bank of England both supply data to the Government (mainly HM Treasury, but also other government departments), City analysts, universities (for research), forecasters, etc. The ONS supplies data to international organisations such as the Organisation for Economic Co-operation and Development (OECD), the European Commission (Eurostat), the IMF and, via the Bank of England, to the ECB and the BIS. The data supplied to the European Commission (Eurostat), the OECD and the IMF are used in analysis of direct investment data by country and by industry, and for other purposes as well. These institutions also produce publications in which UK data are quoted and comparisons are made with data from other countries. The Bank of England also supplies data to the BIS and publishes the international reserves and liquidity Template on its website.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The United Kingdom’s economic data collection system can be broadly described as an “enterprise survey system” (as defined in paragraphs 131 and 132 of the Compilation Guide to the 5th edition of the IMF Balance of Payments Manual (BPM5)). In a survey system enterprises are surveyed using registers. The surveys cover all units in the population in some areas. In other areas, different techniques are used for grossing-up which are generally based on either the population counts or an independent variable such as historical turnover held on the register. In the United Kingdom the b.o.p. surveys are completely integrated into the statistical system for the economic accounts (national accounts). Sample surveys keep inquiry costs to a minimum both for the

Government, in terms of processing, and business, in terms of filling-in forms. They also lead to a quicker delivery of survey results than might be the case with a census. The surveys are largely based on paper forms1 which are sent, depending on the survey, to either the enterprise or the head of the enterprise group within the United Kingdom, in which case consolidated information for the group as a whole is requested.

The enterprise survey system used by the United Kingdom includes stock statistics; i.e. some balance sheet data are collected on the surveys. Data extracted from a securities database system are used to compile estimates of non-resident transactions in bonds and notes within portfolio investment in the United Kingdom. Data from the BIS database are used to compile estimates of non-banks’ transactions, balance sheets and earnings from the rest of the world.

3.2 REPORTING AGENTS

Surveys are geared to different sectors of the economy and the responding agents are selected on the basis of registers. The main groups of respondents are summarised below.

(i) Banks are defined as all financial institutions recognised by the Bank of England as UK banks for statistical purposes. This includes

1 Although the Bank of England reporting system has largely moved away from a paper-based system in favour of electronic reporting.

(1) institutions which have a permission under Part 4 of the Financial Services and Markets Act 2000 (FSMA) to accept deposits other than (i) credit unions, (ii) firms which have a permission to accept deposits only in the course of effecting or carrying out contracts of insurance in accordance with that permission, (iii) friendly societies, and (iv) building societies;

(2) European Economic Area credit institutions with a permission under Schedule 3 to FSMA to accept deposits through a UK branch; and

(3) the Banking and Issue Departments of the Bank of England (the latter from April 1998).

Resident banks are required to report balance sheet and other returns; details of the principal b.o.p.-related forms are given in Table 1.

Data on banks’ deposit liabilities and lending vis-à-vis non-residents are taken from the core balance sheet return which is primarily used for the compilation of the domestic monetary and credit aggregates.

Equivalent data, to the extent that they are relevant, are collected from building societies (which are also monetary financial institutions) by the Financial Services Authority. Aggregate data are passed to the ONS for inclusion in the b.o.p.

(ii) Government sector: information is provided by the various government departments. Most of the government services and transfers are obtained as a by-product of the compilation of government accounts and from official records.

(iii) Securities dealers are all firms principally dealing in securities and regulated by the Financial Services Authority (FSA) for that activity. The target population is supplied to the ONS by the FSA (the regulator). The ONS design the surveys and securities dealers are required to report via the Quarterly Inquiry (i.e. survey) of Liabilities and Assets, the Quarterly Inquiry of Transactions in Securities, and the Quarterly Inquiry of Income and Expenditure.

(iv) Insurance companies are all authorised insurers in the United Kingdom and all
companies authorised in other EU countries that have places of business in the United Kingdom. The surveys to be completed are the following: Quarterly Income and Expenditure, Quarterly Transactions in Financial Assets, Annual Income and Expenditure, and the Annual Balance Sheet. All surveys are statutory. In addition, all insurance companies with foreign subsidiary or parent companies are required to report on the Annual Foreign Direct Investment (outward) Survey and the Annual Foreign Direct Investment (inward) Survey. These two surveys collect details of transactions with foreign subsidiary and associate companies, the capital and reserves of foreign subsidiaries and associates, and transactions with foreign branches and agents.

(v) *Pension funds* are all self-administered pension funds located in the United Kingdom. The requirement to respond to the three surveys Quarterly Transactions in Financial Assets, Quarterly Income and Expenditure, and Annual Balance Sheet is statutory. The information is used to compile the current and financial accounts within the national accounts. It is also included in the b.o.p. account and as a component of both insurance and pension funds.

(vi) *Investment trusts* are those companies in the United Kingdom which are published in the Directory of Trusts by the Association of Investment Trust Companies. This is a sample survey. The selected companies are required to report on the Quarterly Return of Transactions and the Annual Return of Liabilities and Assets. The information is supplied on a statutory basis.

(vii) *Unit/property trusts* are those authorised under the Financial Services Act 1986. This list is published in the Financial Times Unit Trusts Yearbook. The two survey forms, the Quarterly Return of Transactions and the Annual Return of Liabilities and Assets, collect balance sheet information on the short-term assets and liabilities of collective investment schemes and their transactions in various long-term financial instruments. This information is supplied on a statutory basis.

(viii) *Private non-financial corporations* are surveyed on trade in services and direct investment. For both quarterly and annual data, sample surveys are based on stratified designs and include samples of smaller enterprise groups. The services surveys are primarily focused on consultancy and business services; insurance brokers; fund management; education services; merchanting; and film and television services. Royalties are reported as a separate product in the services survey. For direct investment, enterprise groups receive surveys on direct investment capital and earnings.

(ix) *Households*: some surveys are specifically aimed at the household sector, such as the International Passenger Survey (IPS).

(x) *Customs and Intrastat data*: data on international merchandise trade outside the European Union are collected via customs returns. Intra-EU trade is collected via Intrastat.

(xi) *Transport sector*: the transportation account covers sea, air and other transport. It includes the movement of passengers and freight, and other related transport services.

– Sea transport: statistics relating to UK operators are provided by the Chamber of Shipping (CoS) which conducts surveys into its members’ participation in foreign trade. Since 1995, the CoS has surveyed all its
members annually. Estimates of passenger fares paid to non-resident shipping operators are derived mainly from the results of the IPS.

- Air transport: the transactions of UK airlines are derived from returns supplied by the airlines to the Civil Aviation Authority. Fares paid by UK passengers to non-resident airlines is derived from the IPS.
- Other transport: this covers the movement of passengers and freight, and other related transport services, by rail, road and pipeline. Information is provided by Le Shuttle and Eurostar, and by the International Road Haulage Survey.

3.3 THRESHOLDS

In general, the United Kingdom does not apply thresholds for reporting since the data are collected through surveys. The ONS survey forms request data in millions of pounds sterling to one decimal place, although the option to complete the forms in euro is also available. The Bank of England collects data in thousands of pounds sterling. All survey results are grossed up for sampling fractions and non-response.

3.4 AVAILABILITY OF DATA

The UK b.o.p. is available on a quarterly basis. There are some surveys specific to the b.o.p. In general, the surveys are designed so as to produce high quality national estimates. However, a Eurostat level-three geographical breakdown is available for the current account total; broken down into trade in goods, trade in services, transfers and income. Experimental monthly b.o.p. data have been available since December 1999 (reference month October 1999). An annual geographical breakdown of the UK’s international investment position (i.i.p.) is now available for end-2001 and end-2002 data.

3.5 TIMELINESS

Timeliness varies from survey to survey. In general, the data become available eight weeks after the end of a quarter. There is a four-week turnaround time. Estimates are made for late responses or in the absence of a response either through the grossing procedure or by imputation. Publication of the quarterly b.o.p. accounts takes place 13 weeks after the end of the quarter.

3.6 COMPILATION FREQUENCY

The UK b.o.p. is compiled on a quarterly basis, although data on trade in goods and services are available on a monthly basis.

3.7 DATA CONTROLS

The Statistics of Trade Act used by the ONS contains provisions relating to the provision of inaccurate, false or misleading information. In particular, it is an offence to provide false or misleading information in certain circumstances.

Possible anomalies as a result of inconsistency, implausibility and inconsistencies between reporting schemes are detected by computer programs and/or manual checking by the ONS and the Bank of England. These are usually followed up with the reporting company/bank the following day. The quality of the data received is checked using a combination of validation, auditing and credibility checks, which have been devised over time and which are considered to be appropriate to the ultimate use of the data.

Response rates and reminder procedures are set for each ONS survey. Response rates are set as ONS targets. For banks, the response rate is close to 100%.

Users need to be provided with reliable data as soon as possible after the period to which the data relate. Possible anomalies are detected as early as possible and the reporters concerned
are notified by telephone. Queries and resulting amendments to data are initially carried out over the telephone and changes to data which have been reported are annotated and processed immediately. Persistent problems may result in a visit to the responding company/bank to assist in identifying data problems. Late reporters are initially contacted by telephone and subsequently by letter if the information required is not forthcoming. Enforcement action is taken in cases of persistent non response.

3.8 REVISION POLICY

The ONS and the Bank of England aim to provide accounts that are timely, reliable and internally consistent. Therefore, a balance has to be struck between the need to take account of revisions to component series and the need for coherent accounts. Normally, when the national accounts figures are being prepared for publication in the “Blue Book” and “Pink Book” each year, the estimates for the past four complete years (t-4) are reassessed in the “annual round” and balanced within the input-output framework for years up to t-2. An internal Revisions Task Force decides whether and, if so, which revisions should be introduced. Any methodological changes are subject to a process of “peer group appraisal” involving all other sectors affected by the change.

After publication of the annual figures, the data for all the quarters of the past year covered and those for subsequent quarters only are reassessed in each “quarterly round” (similarly, monthly data are only revised for the years in question). The accounts for periods earlier than those to which reference is made are not usually re-opened in the relevant round. (A detailed description of the revisions in the national accounts is provided in the articles entitled “Handling Revisions in the National Accounts”, by David Wroe, Economic Trends, No 480, October 1993 and “Revisions to the UK Balance of Payments”, by Stuart Brown and Tim Jones, Economic Trends, No 518, December 1996.)

3.9 PUBLICATION

The UK b.o.p. forms an integral part of the national accounts and this is reflected in the compilation process and the revision policy. Data used to compile the b.o.p. are collected within the framework of the national accounts. Within the national accounts the different accounts (including the RoW account) must balance.

The ONS Pink Book is a b.o.p. publication which is prepared by the BoPFS Division of the ONS in collaboration with other divisions within the ONS, other government departments and the Bank of England. Comments on the nature of the publication from various external bodies are welcome.

Publication and dissemination of b.o.p. data are governed by the National Statistics Protocol on Release Practices. Although the Bank of England supplies data for the UK b.o.p., only the Governors of the Bank of England, who are members of the Monetary Policy Committee, have access to the complete b.o.p. data prior to publication, along with the Chancellor of the Exchequer, the Prime Minister, and selected officials at the Treasury. Published data may not reveal, either directly or through residual values, statistics relating to individual institutions unless the prior consent of the latter has been obtained.

The titles of the publications produced by the United Kingdom on b.o.p. statistics are listed in Sub-section 13.1.

4 IMPLEMENTATION

4.1 MONTHLY BALANCE OF PAYMENTS

The BoPFS Division of the ONS manages a programme of work to provide monthly b.o.p. data to the ECB as part of the United Kingdom’s agenda of wider preparations prior to entering EMU if a decision is taken to do so. The programme is sponsored by the Head of the
EMU policy team at HM Treasury and by the Head of the Monetary and Financial Statistics Division at the Bank of England.

A key element of the programme is to ensure that all possible means to estimate the monthly data within existing resources are utilised. Monthly data are used where available, monthly proxy indicators where appropriate, and forecasting techniques elsewhere to estimate a monthly path from quarterly data. As part of its quality assurance programme, the ONS consults with the ECB to examine the quality and use of all the monthly data.

Trade in goods statistics are derived from Intrastat returns for trade within the European Union, and from HM Customs & Excise (HMCE) returns for trade outside the European Union. Data for EU and non-EU trade are published within the six-week deadline after the end of the reference month.

Trade in services statistics are derived from a variety of sources, the majority of which are either monthly or quarterly sample surveys. In some cases, these are supplemented by more comprehensive annual surveys or censuses. Monthly estimates have been produced since 1997, and are published within the monthly Trade First Release within six weeks after the end of each month.

Investment income data are published quarterly by the ONS. The main data sources are quarterly surveys, but monthly balance sheet data collected by the Bank of England are used to derive monthly MFI income flows. For each of the investment income groups, both credits and debits are broken down to a lower level of aggregation to enable monthly data and estimates from the Bank of England to be incorporated where appropriate. Where data are available only at a quarterly frequency, ARIMA methodology is applied to calculate a quarterly forecast; a cubic spline is then used to interpolate the quarterly data and thus produce monthly estimates.

The Bank of England also supplies data for inclusion in the financial account (including reserve assets). The Bank of England has a slightly different approach to that of the ONS, owing to its different expertise and differing collection system. The b.o.p. collection system is a sub-set of the money and banking statistics data collection system. For those series for which it is not possible to find a suitable proxy or a soundly based estimate, the reporting banks will be asked to supply the data on a monthly basis if the United Kingdom joins Monetary Union.

Quarterly estimates for the financial account, which covers flows of investment, are generally based on the same data sources as investment income, i.e. quarterly and annual data. The development of a methodology for monthly estimates will therefore follow a path similar to that for investment income. The flow series are very erratic and it is hard to find a suitable ARIMA model. For those series where no satisfactory data projection method is found, data will have to be collected by the Bank of England (MFIs) and the ONS (non-MFIs) if the United Kingdom joins Monetary Union.

The initial development of estimates for the monthly b.o.p. has focused on national totals vis-à-vis the rest of the world. A significant, and challenging, next step in the programme is to derive a split between intra and extra-euro area flows on a monthly basis. This split is under development for current and capital account series; a system using forecasting and splining methodology, based on quarterly estimates of the EU/non-EU split that have been published alongside global data since September 1997, has been set up and the figures are currently under quality review. The same split for the financial account will be more difficult to achieve, as no similar quarterly estimates are published.

The United Kingdom commenced delivery of monthly b.o.p. data to the ECB in December 1999 and the process was described in more detail in an article in the December 1999 edition.
(No 553) of the ONS publication “Economic Trends”. An update to this was published in the June 2001 edition (No 571), coinciding with the monthly b.o.p. dataset becoming available on the National Statistics website (www.statistics.gov.uk). These articles also gave outside users the opportunity to comment on the approach and the methods adopted to derive the monthly b.o.p., and stressed that research into improved methodology was continuing. While the United Kingdom is not participating in Stage Three of EMU, the data that are provided to the ECB and appear on the internet are supplied on the basis that they are experimental data only.

4.2 ESTIMATION METHODS FOR THE MONTHLY B.O.P. DATA

4.2.1 FOR GOODS

The basic sources of data on trade in goods are customs declarations (SADs – i.e. Single Administrative Documents) for trade with non-EU countries and Intrastat forms (Supplementary Declarations) for trade with EU countries. The statistics are compiled in accordance with the “general trade” system, as described in the UN’s “International Merchandise Trade Statistics: Concepts & Definitions”. Imports are classified according to the country from which goods are consigned and exports according to the country of consignment, as identified at the time of export. For statistical purposes, the customs data use the valuation bases recommended in the UN’s “International Merchandise Trade Statistics: Concepts & Definitions”, namely exports valued on a f.o.b. basis and imports valued on a c.i.f. basis. However, in order to comply with the IMF’s BPM5 a number of adjustments to these basic source data are made by the ONS. One of these adjustments is the conversion of the valuation of imports from c.i.f. to f.o.b., which is made in the following way:

**Insurance**: the cost of insurance premiums on non-oil imports is estimated as a fixed percentage of the value of imports.

Other adjustments are made in order to include certain transactions not reported to Customs and to exclude others that do not involve a change of ownership. These are as follows:

**Second-hand ships**: to include purchases and sales of second-hand ships which are excluded from the Overseas Trade Statistics as the transactions are not notified to Customs.

**New ships delivered abroad**: to include deliveries of new ships built abroad for UK owners while the vessels are still in foreign ports as the transactions are not notified to Customs.

**North Sea installations**: to include goods (including drilling rigs) directly exported from and imported to the UK production sites in the North Sea. This adjustment is also used when there is a redistribution of the resources of fields which lie in both UK and non-UK territorial waters (e.g. the Frigg, Murchison and Statfjord fields). In these circumstances, the imported from various countries) to tonnage of goods arriving by sea. For the land legs, estimates of freight rates per tonne-kilometre for different commodities and estimated distances are used. Estimates of rail freight through the Channel Tunnel are made from data provided by Le Shuttle and freight operators. The cost of freight for imports arriving by air is derived from information on the earnings of UK airlines on UK imports and the respective tonnage landed by UK and foreign airlines at UK airports. Pending investigations into an alternative methodology, the cost of freight and insurance for oil and gas imports is projected from data formerly supplied by the Department of Trade and Industry. The information sources are as follows: tonnage from Customs; freight rates from the Chamber of Shipping, the Civil Aviation Authority, road hauliers and Le Shuttle.

**Freight**: the cost of freight services for the sea legs of dry cargo imports is estimated by applying freight rates (derived from the rates for a large sample of individual commodities imported from various countries) to tonnage of goods arriving by sea. For the land legs, estimates of freight rates per tonne-kilometre for different commodities and estimated distances are used. Estimates of rail freight through the Channel Tunnel are made from data provided by Le Shuttle and freight operators. The cost of freight for imports arriving by air is derived from information on the earnings of UK airlines on UK imports and the respective tonnage landed by UK and foreign airlines at UK airports. Pending investigations into an alternative methodology, the cost of freight and insurance for oil and gas imports is projected from data formerly supplied by the Department of Trade and Industry. The information sources are as follows: tonnage from Customs; freight rates from the Chamber of Shipping, the Civil Aviation Authority, road hauliers and Le Shuttle.
contribution to (or reimbursement of) a proportion of the development costs has been treated as a purchase (or sale) of fixed assets at the date of the re-determination and appears as an adjustment to imports (exports) of goods.

_NAAFI:_ to exclude goods exported by the Navy, Army and Air Force Institute for the use of UK forces abroad since these are regarded as sales to UK residents.

_Goods not changing ownership:_ the Overseas Trade Statistics exclude temporary trade (i.e. when goods are to be returned to the original country within two years and there is no change of ownership). However, goods may well have originally been recorded as “genuine” trade, but are subsequently returned to the original country. Examples of these “returned goods” are goods traded on a “sale or return” basis; goods damaged in transit and returned for replacement or repair; and contractor’s plant. The same amount is deducted from both imports and exports for the month in which the return movement is declared to Customs.

_Gold:_ trade in gold (i.e. gold bullion, gold coin, unwrought or semi-manufactured gold and scrap) is reported to HMCE, but is excluded from the total export and import statistics published in the Overseas Trade Statistics. However, trade in ores and concentrates and finished manufactures of gold (e.g. jewellery) are included in total exports and imports.

For b.o.p. purposes, all trade in non-monetary gold should be included under trade in goods. Non-monetary gold is defined as all gold not held as reserve assets (monetary gold) by the authorities. Non-monetary gold can be subdivided into gold held as a store of value and other (industrial) gold. The United Kingdom currently makes adjustments to include industrial gold. In exports, the adjustment reflects the value added in refining gold and producing proof coins. In imports, the adjustment reflects the value of gold used in finished manufactures (such as jewellery and dentistry).

Within the transactions of the London Bullion Market, the United Kingdom cannot currently distinguish between monetary gold and non-monetary gold held as a store of value. Accordingly, the United Kingdom has obtained an exemption from adopting IMF recommendations, as specified in the BPM5, on the treatment of gold until 2005. For the time being, these transactions are included in the financial account.

_Letter post:_ to include exports by letter post which are not included in the Overseas Trade Statistics.

_Additions and alterations to ships:_ to include work carried out abroad on UK-owned ships and work carried out in UK yards on foreign-owned ships.

_Repairs to aircraft:_ to include the value of repairs carried out in the United Kingdom on foreign-owned aircraft.

_Goods procured in ports:_ to include fuels, provisions, stores and supplies purchased for commercial use in ships, aircraft and vehicles.

_Smuggling of alcohol and tobacco:_ Customs provide volume figures for smuggled goods entering the United Kingdom based on published estimates of revenue loss and revenue evasion through smuggling. This information is supplemented by information on the average prices of alcohol and tobacco goods in France and Belgium from the published sources of the statistical and banking institutions in those countries in order to estimate the value of smuggled alcohol and tobacco entering the United Kingdom.

_Territorial coverage adjustment:_ for the purposes of the Overseas Trade Statistics, “UK” is defined as Great Britain, Northern Ireland, the Isle of Man, the Channel Islands and the Continental Shelf (UK part). Therefore, the Overseas Trade Statistics exclude trade between these different parts of the United
Kingdom, but include their trade with other countries.

For b.o.p. purposes, the Channel Islands and the Isle of Man are not considered part of the UK economic territory. Adjustments are made to exports to include UK exports to those islands and to exclude their exports to other countries; and to imports to include UK imports from those islands and to exclude their imports from other countries.

Diamonds: much of the world’s trade in rough (uncut) diamonds is controlled from London by the Diamond Trading Company, which is part of De Beers. Prior to 2001, in order not to distort the trade statistics, all imports into and exports from the United Kingdom of uncut diamonds which remain in the ownership of foreign principals were excluded from the Overseas Trade Statistics by Customs. In addition, the value of diamonds imported into the United Kingdom can be reassessed after the diamonds have been cleared by Customs. Prior to 2001, this adjustment reflected these changes in valuation. From 2001, the procedure for recording movements of diamonds was changed so that all trade was included in the Overseas Trade Statistics by Customs. From 2001, this adjustment removes movements of diamonds where no change of ownership has taken place.

Adjustments to imports for the impact of VAT Missing Trader Intra-Community (MTIC) fraud: VAT missing trader intra-Community fraud is a systematic criminal attack on the VAT system, which has been detected in many EU Member States. In essence, fraudsters obtain VAT registration to acquire goods VAT-free from other Member States. They then sell on the goods at VAT inclusive prices and disappear without paying over the VAT paid by their customers to the tax authorities. The fraud is usually carried out very quickly, with the fraudsters disappearing by the time the tax authorities follow up the registration through their regular assurance activities.

- “Acquisition fraud” is where the goods are imported from other EU countries into the United Kingdom by a trader, who then goes missing without completing a VAT return or Intrastat declaration. The “missing trader” therefore has a VAT-free supply of goods, as he makes no payment of the VAT monies due on the goods. He sells the goods to a buyer in the United Kingdom and the goods are available on the home market for consumption.

- “Carousel fraud” is similar to acquisition fraud in the early stages, but the goods are not sold for consumption on the home market. Rather, they are sold through a series of companies in the United Kingdom and then re-exported to another Member State, hence the goods move in a circular pattern like a carousel.

The VAT system (and therefore the Intrastat collection of trade statistics) picks up the exports of any “carouselled” goods, but does not pick up the associated import at the time the carouselled goods entered the United Kingdom. As a consequence, UK import statistics have been under-reported.

The ONS in partnership with HMCE have developed a methodology to estimate these adjustments. The method used relies heavily on information uncovered during HMCE’s operational activity. As such, the method cannot be detailed for risk of prejudicing current activity, including criminal investigations and prosecutions, and more generally undermining HMCE’s ability to tackle the fraud effectively. The method is applied only to some of the transactions involving mobile phones and computer components – the commodities of choice of the fraudsters. It specifically excludes other commodities and adjustments for the acquisition variant of the fraud, which cannot be quantified at present.

Adjustment for under-recording and for currency and other valuation errors: these
adjustments compensate for the following types of error:

- failure on the part of traders or their agents to submit details of shipments;
- incorrect valuations recorded; and
- declarations wrongly given in foreign currency instead of sterling.

Regular reviews show the adjustments for non-EU trade remaining broadly constant over time. Those for EU trade have decreased since the early days of the Intrastat system.

Adjustments to estimates for non-response: a review of the introduction of the Intrastat system carried out in 1994 identified a number of difficulties regarding the initial monthly estimates of trade with EU countries provided by Customs. The following describes the adjustments made by the ONS to cope with these difficulties.

The Customs method of estimation for non-response relies on linking the values of trade reported by traders in the current period with previous periods. Problems can arise when traders change their VAT registration (perhaps as a result of an internal reorganisation, mergers or sales). Similarly, problems can arise when a trader starts submitting returns for the first time. If the trader then becomes a non-responder, there may be no history of previous trade upon which to base an estimate. To allow for this, the ONS makes an initial adjustment of +£30 million to both exports and imports (reducing to zero over the following two months).

Furthermore, some traders may submit first declarations for a month that do not include all their trade in that month. Later declarations are then received for the rest of their trade. The pattern of receipt at Customs of these partial returns is analysed to enable the ONS to make initial adjustments to both exports and imports to anticipate these later declarations. These initial adjustments are progressively reduced in subsequent months as late declarations are processed.

The time series for trade with the rest of the world are available monthly on a BPM5 basis from 1980, with a split of the monthly data between EU(15) and non-EU countries on a BPM5 basis available from 1988. These data are available both seasonally adjusted (using X11ARIMA) and not seasonally adjusted. Monthly data on a BPM5 basis are published 40 calendar days after the end of the month for trade with both EU and non-EU countries.

Customs data are subject to revision for some months after they are first published, so that, for example, final monthly data from that source for 2003 were not available before September 2004. In addition, there may be further revisions, generally of a minor nature, to the adjustments made to convert this data to a BPM5 basis.

Exports and imports of military goods to non-UK bases abroad are included within the trade in goods data, but not separately identifiable. Information, including a country breakdown, is supplied to HMCE by the Ministry of Defence. Goods that are shipped abroad for use in UK military bases abroad are excluded from the trade figures.

Exports and imports under special Community programmes (Satellite, Airbus and others) are included within the main trade figures.

4.2.2 FOR SERVICES
Monthly estimates are produced at a high level of disaggregation, using models, where no actual or proxy data exist, to produce estimates at the six-week stage. The most volatile contribution to the monthly profile is the travel item. The timeliness of this item has been improved to meet the six-week deadline.

Components for which monthly data are available comprise some 25% of trade in services credits and 40% of debits, mainly
travel data collected via the IPS, as well as some insurance services data. For the remainder, other monthly data sources are being examined to see if they provide a good correlation with existing quarterly series and might be used as proxies, for example, monthly data on UK airline traffic and passengers on overseas aircraft. Where no monthly data or proxies are available, ARIMA forecasting models are used to extrapolate a quarterly estimate from the existing sources, and a monthly path is interpolated using a cubic spline.

For credits, the monthly estimates predicted the first published quarterly figure to within 5% in ten of the thirteen quarters for which results were produced. For debits, monthly results in all of the thirteen quarters predicted the quarterly figure to within 5%. The quality of the estimates continues to be monitored with the move to the BPM5 presentation.

4.2.3 FOR INVESTMENT INCOME
Monthly estimates have been produced using statistical models (usually ARIMA) with monthly data from the Bank of England based on rates of return applied to monthly balance sheets.

ARIMA models are generally used where no real data are available: a quarterly estimate is extrapolated and then a cubic spline provides the monthly path. The models are reviewed regularly, as the behaviour of certain series might change significantly over time. Identification of ARIMA models has been carried out using a specialised statistical modelling tool developed by the SAS™ software company. In general, estimates of income from direct investment, non-banks’ portfolio investment and non-banks’ other investment are derived using forecast and spline methodology.

4.2.4 FOR CURRENT TRANSFERS
Components for which monthly data are available comprise around 40% of total current transfer credits and debits. For those series with no monthly data or acceptable proxies, statistical modelling is used to extrapolate a quarterly estimate and interpolate a monthly path. As the majority of the volatility in the current transfers data is driven by those series that are available on a monthly basis, this methodology should provide a good predictor of the quarterly outturn.

4.2.5 FOR THE CAPITAL ACCOUNT
Components for which monthly data are available comprise up to around 50% of total capital account credits. For those series with no monthly data or acceptable proxies, statistical modelling is used to extrapolate a quarterly estimate and interpolate a monthly path.

4.2.6 FOR DIRECT INVESTMENT
The ONS maintains a continuous database of reported cross-border merger and acquisition deals, the results of which are being used as monthly proxies for the equity component of quarterly direct investment. Monthly reinvested earnings and other capital transactions are derived using ARIMA modelling. It has been found that use of the merger and acquisition data significantly improves the quality of the forecast compared with modelling alone.

4.2.7 FOR PORTFOLIO INVESTMENT
Monthly portfolio investment data are not available from ONS or Bank of England surveys, but data from banks’ balance sheets are used as proxies in the modelling of some series, together with the counterparty share, cash and fixed-interest security values of major merger and acquisition deals.

4.2.8 FOR FINANCIAL DERIVATIVES
No monthly data are available here. A monthly estimate is derived using ARIMA modelling and interpolation.

4.2.9 FOR OTHER INVESTMENT
Monthly other investment data are not available from ONS surveys. Estimation of these series is generally via ARIMA modelling and interpolation. However, the Bank of England produces a monthly financial account of other investment transactions for banks, using

</table>
monthly balance sheet levels, and these monthly data are used to derive OI bank deposits and lending estimates. Until the introduction of the supplementary reporting arrangements, the distinction between transactions with the euro area and the rest of the world, and the split into short-term and long-term debt, will have to be estimated.

4.3 MONTHLY B.O.P. – IMPLEMENTATION PLAN

A table showing details of the implementation of monthly b.o.p. is shown on the following page. A distinction is made between current data availability and future implementation requirements for the United Kingdom.

4.4 IMPLEMENTATION OF THE BPM5

B.o.p. accounts for the United Kingdom are consistent with the BPM5. The full implementation took place in September 1998, and included the production of extensive detailed historic quarterly data on a consistent basis going back to 1987: for the key economic indicators, data have been re-estimated in line with the BPM5 for almost 50 years.

The adoption of the BPM5 has required a number of complementary activities, such as the interpretation of the new framework within the UK context and the identification of new data sources for concepts and transactions not previously identified. Inevitably, some parts of the new accounts are more firmly based than others. For instance, where new information has been required, this has been more readily available for recent periods than for the more distant past.

In order to produce a full and consistent set of BPM5 accounts, the ONS and the Bank of England had to undertake numerous initiatives. As the United Kingdom uses a survey-based system, this meant changing the survey forms in order to collect new information which was not previously required. A prime example was the quarterly survey of trade in services where there was a greater need for product detail.

The Bank of England also implemented changes to its surveys in conjunction with its Banking Statistics Review. These changes were fully implemented early in 1998. All changes to surveys are discussed with respondents.

One of the major changes to the coverage of the accounts was the removal of the offshore centres, i.e. the Channel Islands and the Isle of Man. With this change to the “definition” of the United Kingdom, the b.o.p. was brought into line with the rest of the national accounts as specified in the Council Directive of 13 February 1989 on the harmonisation of the compilation of gross national product at market prices (89/130/EEC).

Investigations have been carried out into data sources for investment on the part of the household sector, but surveys are relatively ineffective. The possible shortfall in coverage must be kept in perspective; there is little tradition in the United Kingdom of individuals holding foreign-issued securities directly. Most financial investment by households in the RoW sector is undertaken through collective investment media (i.e. unit and investment trusts).

4.5 STANDARD COMPONENTS – QUARTERLY AND ANNUAL

From September 1998 onwards data have been compiled and presented on a BPM5 basis.

5 INVESTMENT INCOME

5.1 SPECIFIC FEATURES OF DATA COLLECTION

Estimates for investment income are largely based on quarterly and annual surveys undertaken by the ONS and the Bank of England. The Bank of England conducts quarterly surveys covering UK banks’ earnings on portfolio investment abroad (credits), UK banks’ earnings on borrowing and lending (within other investment credits and debits) and UK banks’ direct investment earnings (both
Survey conducted by the ONS cover direct investment earnings by sectors other than banks (both credits and debits), portfolio investment earnings (credits only) by insurance companies and pension funds and other financial intermediaries. In some instances earnings are estimated by applying appropriate rates of return to stock data. Since June 2002, the Export Credit Guarantee Department (ECGD) supplies data on income from its taking over of bad debt resulting from ECGD-guaranteed loans.

The ONS has not observed a bias towards the under-recording of credits in the income account. No adjustments are made between annual, quarterly and monthly figures; nor is any reconciliation undertaken between estimates and outcome.

The ONS has been publishing a quarterly EU/non-EU breakdown of income consistent with the BPM5 since March 1999. Furthermore, an annual country breakdown of the main aggregates of the balance of payments current account, which closely approximates level three of the European Commission’s (Eurostat’s) “Vademecum”, has been published since 1996. Compilation systems which produce the quarterly and annual geographic split are used to provide estimates of investment income with EU Member States not participating in Monetary Union. Quarterly back data are available from the first quarter of 1996 onwards.

Investment income estimates for both credits and debits are allocated to countries using the residency of the actual counterpart, i.e. the creditor/debtor principle. There are, however, a number of conceptual and practical limitations associated with the collection of geographical data on investment income. In particular, flows through financial intermediaries are harder to allocate correctly to an individual country. These estimates should be seen as a broad indication of the earnings on investment between the United Kingdom and non-residents.

In general, revisions are carried out as a result of the annual surveys, which are more comprehensive in terms of the sample size and the detail of the questions asked than the quarterly surveys. Moreover, historical quarterly series are revised in line with UK national accounts revisions policy each quarter. This usually means that up to seven recent quarters are liable to be revised on the basis of late returns and corrections to the quarterly survey.

### 5.2 Definitions

In principle, the United Kingdom complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves. Investment income consists of direct investment income, portfolio investment income and other investment income. Dividends are recorded as of the date they are paid. Earnings on reserve assets are included as a separate category for domestic publications, but are included in other investment, as specified by the BPM5, in the data supplied to the ECB.

#### 5.2.1 Direct Investment Income

Earnings from direct investment could, for example, take the form of a dividend or interest on an outstanding loan. The information is collected in annual and quarterly sample surveys which include grossing to the population. Earnings data are collected on:

- the profit or loss attributable to the parent company;
- interest payments and receipts between related concerns; and
- branch profits (currently collected on an all-inclusive basis for branches of financial institutions).

Rates of return can be calculated from the above data, e.g. earnings as a percentage of investment positions held at the end of the period. Reinvested earnings are calculated as profits earned during the period less dividends paid, both for inward and outward investment. Interest payments and receipts between related
concerns as a result of inter-company loans are recorded quarterly and annually.

Once the quarterly figures are published, the monthly estimates are constrained to the real data by maintaining the same path but adjusting the levels. Similarly, quarterly data will be revised to reflect final annual survey results. Annual survey results for foreign direct investment surveys are available around t+12 months.

5.2.2 PORTFOLIO INVESTMENT INCOME
Although income data for banks are collected separately and are not derived from levels, they are also checked against stocks for plausibility. Income from unit and investment trusts is attributed to households if distributed, or to the trusts themselves, if reinvested.

5.2.3 OTHER INVESTMENT INCOME
Although income on loans and deposits by banks are collected separately and are not derived from levels, data are also checked against stocks for plausibility.

5.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

5.4 GAPS
None.

5.5 INTENDED HARMONISATION
None.

5.6 ESTIMATION METHODS
See Sub-section 5.1 above for a summary of the estimation methods. Income data are collected on an accrued basis on ONS and Bank of England survey forms. The ONS and the Bank of England are continuing with preparations to meet the statistical requirements set out in Guideline ECB/2004/15. All the requirements set out in the document entitled “Statistical requirements for Stage Three of Monetary Union – Implementation package” (Implementation Package) would be met on time.

6 CAPITAL ACCOUNT

6.1 SPECIFIC FEATURES OF DATA COLLECTION
Part of the general reporting system (see Sub-section 3.2).

6.2 DEFINITION
In principle, the United Kingdom complies with the recommendations of the BPMS. Since June 2002, the capital account has included debt forgiveness data from the ECGD.

6.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

6.4 GAPS
None.

6.5 INTENDED HARMONISATION
The United Kingdom has published estimates for the capital account routinely in the b.o.p. First Release and Pink Book since September 1998.

Sales and purchases of non-produced non-financial assets have been identified from the extended quarterly survey of trade in services and estimates were included for the first time in the 1998 Pink Book.

7 DIRECT INVESTMENT

7.1 SPECIFIC FEATURES OF DATA COLLECTION
Extensive use is made of commercial databases (e.g. Dun & Bradstreet and Worldbase) in order to maintain a company register as the basis for the sample framework.
The Bank of England collects data on outward direct investment by banks and inward direct investment in banks; the ONS collects data from other sectors. The surveys are based on paper forms which are generally sent to the head of the enterprise group within the United Kingdom and from which consolidated information for the group as a whole is requested. In view of the nature of direct investment, the questionnaires used are relatively complex. Therefore, over the years, there have been a number of changes to the forms to improve consistency and coherence. The latest change concerns the move to the new ESA 95 and the BPM5. In the b.o.p. the historical series have been amended in order to overcome the discontinuity problems.

For non-banks, a geographical breakdown of investment is collected only as part of the annual survey. The analysis of inward investment is based on the country of ownership of the immediate parent company. Thus, inward investment in a UK company may be attributed to the country of the intervening overseas subsidiary, rather than to the country of the ultimate parent. Similarly, the country analysis of outward investment is based on the country of residency of the immediate subsidiary. For example, to the extent that overseas investment in the United Kingdom is channelled through holding companies in the Netherlands, the underlying flow of investment from this country is overstated and the inflow from originating countries is understated.

Quarterly estimates by country based on annual breakdowns are available for investment earnings going back to the first quarter of 1996.

Transactions settled through an exchange of shares are recorded when the deal goes wholly unconditional according to the company involved (respondent). The valuation of transactions settled through an exchange of shares is based on the price declared by the company involved (respondent) at the time when the deal is declared unconditional.

7.2 DEFINITION

Data include the investors’ share of the reinvested earnings of the subsidiary or associated company, the net acquisition of share and loan capital, changes in the inter-company accounts and changes in branch/head office indebtedness. All short-term and long-term loans between affiliated enterprises (including trade credits) are included in the figures for inter-company loans, except for those between affiliated banks and financial intermediaries. Real assets in the sense of investment in land, structures or equipment are recorded in the annual and quarterly surveys.

In the United Kingdom, for the purposes of the statistical survey, direct investment is based on a holding of 10% or more in the foreign enterprise. The surveys cover investment in subsidiaries, associate companies and branches. They do not cover cross-border investment by public corporations or investment in property. These are regarded as direct investment in the national accounts, however, and figures for that activity are added to survey totals when they are used in the b.o.p. and national accounts.

The definitions used to compile direct investment information are based on international guidelines. These include the BPM5, the OECD Benchmark Definition of Foreign Direct Investment (third edition) and the ESA 95. They also take account of corporate accounting practices in the United Kingdom through periodic reviews, which include consultation with contributors.

Direct investment and portfolio investment are measured independently.

It is not possible to identify direct investment specifically from the portfolio investment surveys, mainly because they do not collect information on ownership. The direct investment surveys include special purpose entities in the form of holding companies.

2 See footnote on Sub-section 3.1.
7.3 DEVIATIONS FROM AGREED DEFINITIONS

The United Kingdom does not completely use the fully consolidated system for recording direct investment. On the outward side, respondents are asked to consolidate the figures for each of the indirectly owned subsidiaries and associates with the directly owned businesses, but – if that is not possible – data for indirect subsidiaries and associates should be reported separately. On the inward side, the United Kingdom generally approaches the head of the UK part of the group and asks for consolidated figures for the group as a whole. If requested to do so by the group, the United Kingdom approaches individual enterprises.

Direct investment surveys record earnings net of tax, but tax is added on for national accounts purposes. Earnings of financial institutions are compiled on an all-inclusive basis, rather than according to the current operating performance concept, but the latter concept is applied to non-financial enterprises. Financial derivatives between affiliates are not identified separately.

7.4 GAPS

All sectors are covered, either by the ONS or by the Bank of England, via sample survey data. Monthly data are not collected, except for returns on cross-border mergers and acquisitions.

7.5 INTENDED HARMONISATION

None.

7.6 ESTIMATION METHODS

Estimates for individual concerns not selected for the annual surveys are produced using the actual survey returns. Quarterly aggregates are produced by projecting forward annual figures using the quarterly survey sample.

8 PORTFOLIO INVESTMENT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

For banks, outward portfolio investment is effectively covered by the total outward portfolio investment survey carried out by the Bank of England.

UK banks’ investment in money market instruments issued by the RoW are reported directly to the Bank of England as part of monthly/quarterly surveys, and include debt securities with similar characteristics but issued with an original maturity of over one year.

For non-banks, information on outward investment is obtained from the Annual Balance Sheet Survey form which the ONS sends to pension funds, insurance companies, asset financing companies, non-bank credit grantors, unit trusts and investment trusts. The actual population varies for each survey. The surveys are all conducted on a statutory basis.

The ONS calculates estimates of transactions in foreign-issued securities on the basis of integrated quarterly surveys which have separate questions on securities issued by non-residents and by UK residents. Estimates of holdings are based on similar but less frequent (e.g. annual) surveys. Financial companies report transactions directly (acquisitions and disposals), while those of non-financial companies are estimated from changes in balance sheet values. Estimates of UK investment in money market instruments issued by non-residents are obtained from quarterly/annual surveys carried out by the ONS.

Investment in UK government securities is calculated by the ONS as the difference between net new issues and net investment from UK domestic sources, including the banking statistics. The correct sectorisation of holdings is complicated by the widespread use of nominees. To address the latter problem, the Bank of England and the ONS have conducted a
periodic survey of the beneficial ownership of British government securities.

Investment in UK company bonds is calculated by the ONS as the difference between net new issues and net investment from UK domestic sources. The sectorisation of these bonds is currently based on the assumption that UK banks’ and other sectors’ liabilities to non-residents are roughly in proportion to their percentage of the total company bonds issued that quarter. A similar methodology is used to estimate non-resident acquisitions or disposals of government foreign currency bonds. Purchases by non-residents are assumed to be the residual value after accounting for acquisitions and disposals by UK banks and non-banks.

Estimates of investment in ordinary shares of UK companies are derived from quarterly surveys conducted by the ONS and the Bank of England and from Stock Exchange data. These data are then adjusted to take account of total stocks of non-resident investment in ordinary shares collected in the ONS’ annual Share Ownership Survey (formerly the Share Register Survey – SRS). Estimates are also included for investment in unquoted shares. Estimates for non-resident investment in money market instruments issued by UK banks are derived by the Bank of England from monthly/quarterly surveys. Estimates of non-bank money market instrument liabilities are predominantly derived from residual values after accounting for all net issues and net purchases. This residual estimation method is used, in particular, to estimate non-resident investment in commercial paper and sterling Treasury bills.

In common with many other countries, the United Kingdom has problems compiling accurate information on the geographical allocation of tradable inward portfolio investment (including equities, bonds and money market instruments) when the securities can be sold on in secondary markets – as the issuer of the security may not be aware of the current holder.

It is not possible to identify direct investment specifically from the portfolio investment surveys, mainly because they do not collect information on ownership.

8.2 DEFINITION

Estimates of non-resident investment in UK company bonds are obtained by assuming that any net transactions in UK securities not attributed to the domestic sectors (using all the sources of information available) are attributable to non-residents.

Geographical analysis of assets is based on balance sheets (stocks) on a quarterly basis for banks and annually for non-banks.

Fee and commission earnings for banks are collected on Form PL (see Sub-section 3.2), and are included (on a gross basis) in the trade in services component of the current account – and are therefore not included within portfolio investment income.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

The United Kingdom does not currently produce portfolio investment income with a maturity breakdown.

8.5 INTENDED HARMONISATION

The ONS and the Bank of England are currently carrying out a study to assess the feasibility of adopting an improved data collection model for portfolio investment.

8.6 ESTIMATION METHODS

See Sub-section 8.1 for a description of the estimation methods. Quarterly estimates are produced for portfolio investment.
Surveys for pension funds, insurance companies and securities dealers use common methods for compiling quarterly estimates. In each case the information is collected from a sample of companies. The data are then grossed up using auxiliary information, which is available for the complete population of the industry. The samples are broken down in strata that group together companies with similar characteristics. Any unusual returns will be validated and abnormally large returns will be given a reduced weight in the estimation process.

9 FINANCIAL DERIVATIVES

9.1 SPECIFIC FEATURES OF DATA COLLECTION

The Bank of England has collected quarterly data on the derivatives activity of banks since the fourth quarter of 1997 and has published a breakdown of positions outstanding by product, risk category and sector of the counterparty (including separate identification of non-residents) since the second quarter of 1998. The ONS has collected information from the major non-bank financial institutions since the first quarter of 1998. Separate derivative balance sheet information is published in the Pink Book, but this is for information only, and is not included in the UK i.i.p.

For non-bank financial institutions, additional questions have been added to the existing ONS surveys to collect annual balance sheet information and quarterly transactions data. In addition, for the securities dealers’ sample, the quarterly transactions and balance sheet surveys includes some additional questions on the product and sectoral breakdown of the counterparties. The sectoral breakdown is collected on a quarterly basis. Respondents are asked to provide a split between transactions and positions held with central banks, banks, building societies, other financial institutions, non-financial institutions and the RoW. The instrument breakdown requested on the forms is swaps, FRAs and other derivative instruments. The process of estimation is the same for each instrument specified. No geographical breakdown is collected other than resident/non-resident.

9.2 DEFINITIONS

Data are collected according to the international statistical standards, using the normal residency criterion (country of incorporation of the counterparty). Although stocks are collected on a gross basis, transactions in derivatives are collected on a net basis, i.e. transactions in assets are not separately identified from transactions in liabilities.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

The United Kingdom does not currently publish comprehensive data on financial derivatives. Settlement receipts and payments on interest rate swaps only are published within the financial account.

9.4 GAPS

No geographical breakdown is available for non-bank financial institutions and, except in the case of security dealers, the instrument and counterparty sector breakdowns are limited: investigations are continuing into whether the information can be compiled at the level of detail requested. It is not possible to distinguish...
between option-style variation margins and future-style variation margin payments.

9.5 INTENDED HARMONISATION

None.

9.6 ESTIMATION METHODS

Some banks approximate the split between resident and non-resident transactions in derivatives. In addition, a full geographic analysis of transactions is not currently possible, and any split between euro area/non-euro area countries will need to be estimated from stocks.

All the surveys that collect derivatives data, including pension funds, insurance companies and securities dealers, will use common methods for compiling quarterly estimates. These surveys are linked to those collecting information on portfolio investment (see Sub-section 8.6). The estimation of a geographical breakdown will probably be based on experience with the data collected for the banks.

The sectoral breakdown of other investment produced by the ONS is limited to a split between MFIs (with banks and building societies separately identified), central government, public corporations and other sectors. The other sectors category consists of insurance companies and pension funds, other financial intermediaries, private non-financial corporations and the household sector, but these sectors cannot be separately identified.

Estimates concerning the assets and liabilities of other UK residents (non-government, non-banks) come from a variety of sources including the ONS, the Bank of England, the European Investment Bank and the BIS. Export credits are taken from the ECGD, together with long-term sterling assets acquired from UK banks under ECGD refinancing agreements. In principle, trade credit is recorded at the time of the extension of credit. The Bank of England and the ECGD submit real trade credit data on a quarterly basis, and this is incorporated into the quarter’s figures. Since June 2002, data supplied by the ECGD on the taking over of bad debt resulting from ECGD-guaranteed loans have been published quarterly. Associated debt forgiveness figures are also included in the capital account.

For inward other investment in banks, the United Kingdom sees no distinction between loans and deposits. The estimates for foreign loans to UK banks are therefore included indistinguishably under deposits. For outward investment, all loans by MFIs are assumed to be short-term and, for inward investment, all loans to UK securities dealers are assumed to be short-term.

Flow data for MFIs’ deposits from, and lending to, non-residents are derived from end-period stock data adjusted for exchange rate movements and other identified changes in outstanding liabilities and claims not arising from ‘transactions’. Balance sheet positions, reported in sterling equivalent at middle-market end-period rates are reconstituted in their original currencies using supplementary returns covering the currency composition of assets and liabilities (there is some element of brigading of
positions in statistically less significant currencies, which may be translated by an appropriate proxy). The resulting first differences in original currencies are retranslated into sterling at average exchange rates for the period concerned.

Within the breakdown by domestic sector, the contribution of the central bank (monetary authorities) is subsumed within the aggregates for the MFI sector as a whole, of which it forms a part. The central bank completes a full set of statistical returns so the data sources are the same as for other MFIs and positions will be recorded according to the definitions in the monetary statistics. This ensures coherence across the Sector Financial Accounts as a whole. The estimates of flows, as described above, are compiled at the level of the MFI sector overall.

10.2 DEFINITION

In principle, the United Kingdom complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves. Other investment consists of trade credit, loans, currency and deposits and other assets and liabilities. MFIs’ trade credit was reclassified under loans in June 2002. Finance leasing is included within loans and is recorded according to standard international guidelines. Foreign currency notes and coin are included under currency and deposits.

repos (i.e. sale and repurchase agreements for securities), and the similar sell/buy-back transactions, are recorded on a collateralised loan basis. The majority of repos usually mature within a single month. Loan portfolio trading should, in principle, be recorded indistinguishably within total loans, but – as the data are not collected separately – it is not possible to assess its significance.

All acquisitions of bonds are recorded under either direct or portfolio investment.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

With regard to the classification of non-monetary gold, the United Kingdom had a derogation under Council Regulation (EC) No 2223/96 until 2005, but this was abrogated by Council Regulation (EC) 1267/2003. According to the SNA 93/ESA 95, all non-monetary gold is treated as a commodity. In the United Kingdom, financial gold is traded in the same way as any other financial asset and is treated like any other foreign currency in the b.o.p. Reporting requirements for the period after the abrogation of the derogation are under review.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

Quarterly estimates are produced for other investment. See Sub-section 10.1 above for a summary of the estimation methods.

11 RESERVE ASSETS

11.1 SPECIFIC FEATURES OF DATA COLLECTION

The United Kingdom’s reserve assets are the property of Her Majesty’s Government and are held in the Exchange Equalisation Account (EEA), a government account. They are managed by the Bank of England on behalf of HM Treasury under agreed procedures. Data for the b.o.p. entry for reserve assets are drawn

3 Debt and reserves management report 2004-05, HM Treasury, March 2004 (http://www.hm-treasury.gov.uk/documents/uk_economy/debt_management_report/ukecon_dmr_04to05.cfm)
from administrative sources at the Bank of England (primarily from the information systems used in the process of reserves management). Since July 1999 data on the UK reserves have been produced in accordance with the IMF Data Template on International Reserves and Foreign Currency Liquidity. As a result an instrument breakdown is available on a monthly basis (within three working days) and a currency breakdown is available (with a two-month lag) on a quarterly basis.

Reserve assets are valued at market prices and converted into sterling using mid-market closing rates at the end of each month. Reserve assets in the United Kingdom are recorded on a contract date basis allowing the incorporation of off-balance sheet items such as swaps and forwards into the reserves.

11.2 DEFINITION

Reserve assets are presented on a BPM5 basis in the UK b.o.p. In practice, all reserve assets of the United Kingdom are readily available (i.e. highly liquid, marketable and creditworthy) and denominated in foreign currency (i.e. in currencies other than pounds sterling). For b.o.p. purposes, only claims on non-residents are included.

Central government acquisitions of rest-of-world money market instruments are identified separately and published in the Pink Book 2003.

Details of the instrument breakdown are published monthly on the UK version of the IMF Data Template on International Reserves and Foreign Currency Liquidity.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

The reserve assets of the United Kingdom comprise the holdings of the UK Government (Treasury), reflecting the present legal and institutional arrangements in the United Kingdom – which differs from euro area institutional arrangements.

11.4 GAPS

None.

11.5 INTENDED HARMONISATION

None required at present.

12 INTERNATIONAL INVESTMENT POSITION

12.1 SPECIFIC FEATURES OF DATA COLLECTION

The i.i.p. is published quarterly as part of the UK b.o.p. dataset, with a timeliness of three months. I.i.p. levels are fully consistent with the RoW sector accounts balance sheets.

For banks, data on levels are collected on a quarterly basis with respect to both direct and portfolio investment assets and, on a monthly basis, for other investment assets and liabilities (loans and deposits). A full country breakdown of stocks is reported quarterly for deposits, loans and portfolio investment assets and annually for direct investment assets and liabilities. See Table 1 for more details of the reporting forms. Data are collected according to international guidelines, and to the same time scale as the b.o.p. (see Sub-section 3.9).

For other financial intermediaries, quarterly levels are based on a combination of pure stock data and accumulated flows. However, with the exception of liabilities for portfolio and other investment, surveys on levels are conducted at least annually. Annual benchmark surveys – typically with an expanded sample compared with quarterly surveys – are conducted for direct investment and portfolio investment assets, and take place around 10 months after the year-end. Therefore, published levels for the year-end are considered to be provisional until the release of those data published after 12 months. Quarterly levels between benchmark survey levels are revised on the basis of the previous quarterly profile. (Essentially, quarterly flows are pro-rated to the annual flow.
and accumulated to the previous year’s level to bring them into alignment.)

The United Kingdom participated in the 1997 and 2001 IMF Co-ordinated Portfolio Investment Surveys (CPIS) and will now continue to participate on an annual basis. Data relating to banking activities were collected from standard balance sheet returns (primarily servicing the BIS international banking statistics), while additional data collection has been launched for non-banks.

The ONS published a first geographical breakdown of the UK’s i.i.p. in the summer of 2003. This includes existing information from Bank of England and ONS surveys, data collected as part of the UK’s contribution to the CPIS and information on non-resident holders of UK securities derived from other countries’ CPIS participation.

12.2 DEFINITIONS

In principle, the United Kingdom complies with the recommendations of the BPM5 and the harmonisation proposals made by the Working Group on Balance of Payments and External Reserves.

12.2.1 GENERAL

I.i.p. definitions are in line with international guidelines, with practices being similar to those outlined in earlier chapters for information on income.

12.2.2 DIRECT INVESTMENT

Direct investment positions are recorded at book value, equal to historic cost minus allowances for depreciation and write-offs. The directional principle is used, and reinvested earnings are also included.

12.2.3 PORTFOLIO INVESTMENT

The United Kingdom estimates the level of portfolio investment liabilities for equity held by non-residents directly. The ONS conducts the annual Share Ownership Survey (SOS) in order to identify holdings by the domestic sector as well as the RoW (see also Sub-section 8.1). Data are also sourced from the electronic CREST registration system, which also includes UK government securities (gilts). There is a limited geographical breakdown available from the SOS; there is none from CREST. Otherwise there is no direct measurement of RoW levels for debt liabilities: these are generally deduced from total UK issues less domestic acquisitions.

Portfolio investment instruments are collected according to international definitions, with money market instruments being recorded at the market, or discounted, price.

12.2.4 FINANCIAL DERIVATIVES

The vast majority of stock data are collected on a marked-to-market basis, although some banking book data are collected on an accruals basis. This applies to all instrument types – including options, swaps, FRAs and forwards. Data are recorded on a gross basis, meaning that levels with a positive value are recorded separately from positions with a negative value.

12.2.5 OTHER INVESTMENT

International guidelines are followed in recording other investment stocks.

12.2.6 RESERVE ASSETS

Reserve assets data are recorded at closing middle market exchange rates and valued at end-period market prices. Data recorded in the i.i.p. are based on stock data produced from administrative information. Since July 1999 data on the UK reserves have been produced in accordance with the IMF Data Template on International Reserves and Foreign Currency Liquidity. For further information on the compilation of reserves data, see Sub-section 11.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

There is currently no reconciliation between flow data in the b.o.p. and levels data in the i.i.p.
12.4 GAPS
None.

12.5 INTENDED HARMONISATION
See Sub-section 12.3.

12.6 ESTIMATION METHODS
None.

5.1 BULGARIA

As of 1 February 2004
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The Bulgarian National Bank has been responsible for compiling the balance of payments (b.o.p.) since 1991. Data are processed by the Balance of Payments and External Debt (BOPED) Division within the Statistics Directorate of the Bulgarian National Bank. The Bulgarian National Bank compiles and publishes the monthly b.o.p. in accordance with methodological principles of the fifth edition of the IMF "Balance of Payments Manual" (IMF, 1993) (BPM5) and the European Central Bank Guideline ECB/2003/7. In compiling the b.o.p., the Bulgarian National Bank is fully independent from the general government and follows the methodological principles of the BPM5.

2.2 LEGISLATIVE PROVISIONS

The Bulgarian National Bank’s responsibility for b.o.p. compilation is provided for in Article 42 of the Law on the Bulgarian National Bank. The Foreign Exchange Law, amended in July 2003, specified a number of requirements for different reporting agents with regard to b.o.p. data and strengthened the ability of the Bulgarian National Bank to collect information. In August 2003, Regulation No 27 on Balance of Payments Statistics was issued in compliance with the amended Foreign Exchange Law.

2.3 INTERNAL ORGANISATION

At the Bulgarian National Bank, the b.o.p., the i.i.p., external debt and the data template for international reserves and foreign currency liquidity are compiled in the BOPED Division within the Statistics Directorate. This Directorate has three divisions, namely the BOPED Division, the Monetary and Banking Statistics Division and the General Economic Statistics and Publications Division.

At present, the BOPED Division, which has a total of 15 staff, is made up of the following four sections:

- **Methodology and Analysis**: this section has two staff and is responsible for the development and improvement of the methodology for b.o.p., external debt and i.i.p. statistics, for the maintenance of metadata, as well as for analysis.

- **Compilation**: this section has two members of staff and its responsibilities include the final compilation of b.o.p., i.i.p. and external debt statistics and of the data template for international reserves and foreign currency liquidity.

- **Financial Sector Reporting**: this section also has four members of staff and is responsible for the collection, processing and checking of flow and stock data from the commercial banks.

- **Non-financial Sector Reporting**: this section has six members of staff and is responsible for the collection, processing and checking of flow and stock data from companies and other non-financial institutions.

2.4 EXTERNAL COOPERATION

The Bulgarian National Bank receives customs declarations’ trade data from the Bulgarian Customs Agency. These data are supplemented with data from the National Statistical Institute (NSI) and are further processed by the Bulgarian National Bank.

The data on travel are based on information from the Ministry of Internal Affairs on the number of travellers crossing the borders and on estimates of per capita receipts and expenditure based on the methodology of the Bulgarian National Bank and the Ministry of the Economy. The Bulgarian National Bank receives information on current transfers from the Ministry of Finance and from other government agencies.

The Bulgarian National Bank receives monthly data on direct investment in the country from the Privatisation Agency, the Central
ECB and accession countries' balance of payments statistical methods
November 2004

Commercial banks For m B-1 All transactions between residents and non-residents aggregated by economic code. Data is reported in USD and BGN. Conversion is made using the exchange rate on the date of the transaction (if it is not available, the average monthly exchange rate is used).

Form SPB-1 Information about credits, granted to or received from non-residents above a threshold of 5,000 BGN or equivalent – creditor and debtor data, type of credit, purpose of the credit, currency, date of disbursement, interest rates, repayment schedule, etc.

Form B-2 Information about the transactions associated with the financial credits of clients to the commercial bank, granted to or received from residents during the reporting period – creditor and debtor data, type of credit, currency, date of disbursement. Flows during the month are reported. Data is reported in USD. Conversion is made using the exchange rate on the date of the transaction (if it is not available, the average monthly exchange rate is used).

Form B-3 Information about the transactions associated with direct investments of clients to the commercial bank – investor data, type of investment, currency, date of disbursement. Flows during the month are reported. Data is reported in USD. Conversion is made using the exchange rate on the date of the transaction (if it is not available, the average monthly exchange rate is used).

Form B-4 Information about bonds issued by residents and held by local banks, residents and non-residents. Stocks at the end of the month are reported. Data is reported in original currency.

Form B-6 Breakdown of commercial banks’ transactions with non-residents – outgoing and incoming payments by amount and number of transaction.

Form B-7 Information about the transactions associated with the financial credits granted to or received from non-residents during the reporting period – disbursements, principal payments, interest payments, principal in arrears, interest in arrears, repaid arrears, rescheduled principal, accrued interest, restructured debt, etc. Stocks at the beginning and end of the quarter are reported. Data are reported in the original currency.

</tbody>
</table>
The Bulgarian National Bank receives monthly data on direct investment abroad from the commercial banks’ reports, and quarterly and annual data from reports from direct investment enterprises. The Bulgarian National Bank also receives reports from more than 3,000 companies reporting their external assets and liabilities directly to it.

With respect to the b.o.p. methodology, the Bulgarian National Bank works in close cooperation with the European Central Bank (ECB), Eurostat and the International Monetary Fund (IMF). Since 1998, experts from the BOPED Division have been participating in the b.o.p. working group meetings organised by Eurostat. Since November 2000, the Bulgarian National Bank has been participating in the b.o.p. meetings organised annually by the ECB for the accession countries.

2.5 USERS

B.o.p. data are supplied to numerous internal and external users. Within the Bulgarian National Bank, the main users of the b.o.p. are the Managing Board, the Economic Research and Projections Directorate, the General Economic Statistics and Publications Division within the Statistics Directorate, the Issue Department, etc.

Externally, the main users of b.o.p. and external debt data are the Council of Ministers, the Ministry of Finance, the Ministry of the Economy, government agencies, foreign embassies, international financial organisations, international investors and rating agencies. B.o.p. data are used as an input to the Rest of the World account of the System of National Accounts produced by the NSI. The Bulgarian National Bank sends quarterly and annual data to Eurostat in GESMES format. Monthly b.o.p. and reserve asset data, as well as annual i.i.p. data, are sent to the ECB also in GESMES format. Quarterly b.o.p. data, annual i.i.p. data and monthly trade data are sent electronically to the IMF.

3 STATISTICAL SYSTEMS

3.1 TYPE OF COLLECTION SYSTEM

The existing mixed compilation system was introduced in 1996. At present, it includes: (i) commercial banks’ reports; and (ii) reports by enterprises with bank accounts abroad, reports from companies with assets and liabilities vis-à-vis non-residents, as well as surveys of the largest foreign direct investment companies.

3.2 REPORTING AGENTS

(i) Banking sector – in 2003, after the amendment of the Foreign Exchange Law, the Bulgarian National Bank introduced some improvements to the existing collection system. The banks should report monthly (using Form B-1) all transactions between residents and non-residents above a threshold of 5,000 Bulgarian leva (BGN) (approximately €2,556). In accordance with a regulation, the banks provide the Bulgarian National Bank with information aggregated by economic code. They keep a record of all these transactions and are obliged to present the Bulgarian National Bank with detailed information upon request. B.o.p. data also are provided to the Bulgarian National Bank using other reporting forms. For some b.o.p. items, such as
direct investment in the reporting country and loans between residents and non-residents, the Bulgarian National Bank receives detailed monthly and quarterly information respectively.

(ii) Corporate sector – partial direct reporting companies provide the Bulgarian National Bank with quarterly reports as follows:
– enterprises with bank accounts abroad are obliged to provide quarterly reports on their transactions with non-residents channelled via those accounts. The Foreign Exchange Law stipulates that all enterprises with accounts abroad are obliged to declare them for statistical purposes to the Bulgarian National Bank;
– enterprises with financial loans with non-residents are obliged to declare them to the Bulgarian National Bank for statistical purposes and to provide quarterly reports on these transactions to the Bank;
– enterprises with other assets and liabilities (trade credits, etc.) provide quarterly reports on the stocks of their liabilities/assets other than financial loans vis-à-vis non-residents. Data are provided on the country of the creditor/debtor and in the original currency. Flow data are derived from stocks; and
– enterprises with direct investments abroad are obliged to declare them for statistical purposes to the Bulgarian National Bank. They also provide quarterly information on their direct investment (FDI) abroad and selected number of them respond to the annual direct investment survey conducted by the Bulgarian National Bank.

(iii) Monetary authorities – the Accounting Directorate of the Bulgarian National Bank provides the BOPED Division with monthly data on the reserve assets, as well as on its own transactions with non-residents.

(iv) General government – the Ministry of Finance provides the Bulgarian National Bank with monthly information on government and government-guaranteed external debt. Data on transactions made on behalf of the general government and its agencies are also obtained from the reporting forms of the Bulgarian National Bank and the commercial banks. Monthly reports are also received from the Central Depository and from the Privatisation Agency.

3.3 THRESHOLDS
A simplification threshold of BGN 5,000 (approximately €2,556) was introduced by the Foreign Exchange Law.

3.4 AVAILABILITY OF DATA
The Bulgarian National Bank compiles a monthly b.o.p. Geographical and sectoral breakdowns are available on a monthly basis, but only for items such as foreign trade, direct investment and other investment – trade credits and financial loans. For direct investment abroad, geographical and sectoral breakdowns are available on a quarterly basis.

The i.i.p. is compiled annually. First estimates are available within nine months after the end of the reporting year. They are subject to further revisions depending on the availability of additional information. Final i.i.p. data are available within 12 months after the end of the reporting year. Breakdowns by institutional sector and by instrument are available. For other investment and reserve assets, a currency breakdown is available.

3.5 DATA CONTROLS
At present, there are no built-in computerised data controls, which is mainly due to the software used (Microsoft Excel and Access) for processing the incoming information. However, some systematic quality checks are made by comparing data for previous periods with

current reports. For some b.o.p. items, reports from companies are cross-checked with reports from banks. Checks for consistency with monetary and banking statistics are also made. Checks are also carried out using information obtained through regular contacts with banks and companies or even from newspapers and other media. Data controls are also based on staff knowledge and expertise.

3.6 REVISION POLICY

Revisions of published b.o.p. estimates are a common feature of b.o.p. compilation systems. With the publication of revisions, the users are made aware of the revised data items in a timely manner. The revision policy pursued by the Bulgarian National Bank is based on the following principles:

(i) concerning the most frequent data, each monthly publication includes revisions of the data for the previous three months and each quarterly publication includes revisions of the monthly data for the entire current year;

(ii) when ongoing changes are made as a result of additional information collected and the elimination of errors, the Bulgarian National Bank informs the users in a timely manner through the monthly press releases, as well as through the footnotes in the tables; and

(iii) when significant revisions are made as a result of changes in the methodology for the reporting of certain b.o.p. components or for other reasons, the Bulgarian National Bank publishes information on the changes in advance in order to assist the users of the data.

3.7 DISSEMINATION

The Bulgarian National Bank publishes the data within eight weeks after the end of the reference period. The advance calendar for data dissemination, the b.o.p., external debt and the data template for international reserves and foreign currency liquidity is posted on the Bulgarian National Bank’s website. The Bulgarian National Bank announces the publication of the press release on the monthly b.o.p. data a week in advance. The press release is published on the website of the Bulgarian National Bank at http://www.bnb.bg. The data are also published in the Bulgarian National Bank’s Monthly Bulletin. Data on the country’s b.o.p. are also included in the official semi-annual and annual reports of the Bulgarian National Bank.

4 GOODS

4.1 SPECIFIC FEATURES OF DATA COLLECTION

The data on imports and exports (f.o.b.) are based on customs declarations from the Customs Agency. Data are processed based on the Harmonised System for the Description and Coding of Commodities of the World Customs Organisation. The Bulgarian National Bank and the NSI receive the export and import data, supplement them with other information and process them.

In accordance with the common methodology of the Bulgarian National Bank and the NSI, exports and imports have, since 1999, been recorded under the special trade system where the moment of registration of a transaction coincides with the moment of the clearance of the customs declaration.

4.2 DEFINITION

The goods component of the b.o.p. current account covers movable goods for which changes of ownership between residents and non-residents occur. The country’s exports are reported f.o.b. and imports c.i.f. as, for the purposes of the b.o.p., total imports are recalculated on a f.o.b. basis.
4.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

4.4 GAPS
For the time being, there are no estimates of shuttle trade.

4.5 INTENDED HARMONISATION
No harmonisation is necessary.

4.6 ESTIMATION METHODS
None.

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION
The Bulgarian National Bank derives the data on freight transportation as a percentage of foreign trade data and those on passenger transportation as a percentage of travel receipts and expenditure. The NSI provides the Bulgarian National Bank with monthly data on the receipt of transit fees.

The travel data are based on information from the Ministry of Internal Affairs on the number of travellers crossing the borders and on estimates of per capita receipts and expenditure based on the methodology of the Bulgarian National Bank and the Ministry of the Economy.

The main source of information on the other services item is the commercial banks.

5.2 DEFINITION
Following the BPM5, the services component comprises transportation, travel and other services. Transportation services cover freight and passenger transportation as well as transit fees on the credit side. No breakdown for means of transportation is available. Travel covers goods and services, including those related to health and education, acquired by travellers for business and personal purposes. The other services item covers receipts and payments related to services other than transportation and travel (communication, construction, financial, leasing, insurance, cultural, sport and recreational services, government services n.i.e.,\(^1\) etc.).

5.3 DEVIATIONS FROM AGREED DEFINITIONS
None.

5.4 GAPS
Data availability for certain items is limited.

5.5 INTENDED HARMONISATION
The Bulgarian National Bank is currently working on a project to develop a new methodology to estimate receipts and expenditure from transportation services. The plans for the near future also include a new methodology for the estimation of travel receipts and payments.

5.6 ESTIMATION METHODS
No estimations are necessary.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS
In line with the BPM5, income consists of two main categories, namely: (i) compensation of employees; and (ii) investment income.

6.1.1 COMPENSATION OF EMPLOYEES
Compensation of employees covers wages, salaries and other benefits paid to non-resident workers in the country or received by resident workers abroad. The main source of

---

\(^1\) Not included elsewhere (see BPM5, paragraph 168).
information on this sub-item is the commercial banks.

Investment income covers receipts and payments of income associated with external financial assets and liabilities. Included are receipts and payments on direct investment, portfolio investment, other investment and receipts on reserve assets.

6.1.2 INCOME ON DIRECT INVESTMENT
In line with the BPM5, the direct investment income item in the Bulgarian b.o.p. comprises income on equity (dividends and reinvested earnings) and income on debt (interest). Breakdowns by country and by sector are available. The sources of information on reinvested earnings (debit side) are the quarterly data on commercial banks’ net current profit/loss, as well as the results from the annual survey conducted by the NSI among non-financial enterprises and the data from the annual commercial banks’ balance sheets and reports. Reinvested earnings (credit side) are recorded annually on the basis of the survey conducted by the Bulgarian National Bank. Income on inter-company loans is recorded monthly. The source of information on the debit side for non-financial enterprises is the Private Debt Register (in which inter-company loans are also recorded) and, for the banking sector, commercial banks’ data. The sources of preliminary information on the credit side are commercial banks’ monthly reports and this information is later replaced by data from the annual survey on direct investment abroad. Only actual payments are recorded.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
Income on portfolio investment covers income on equity, income on debt and income on financial derivatives, as defined in the BPM5. Data on the credit side (flows) are received mainly from the commercial banks and through direct reporting from local companies which have extended loans to non-residents. Data on the debit side of the loan item is received from the Ministry of Finance, the Bulgarian National Bank, the commercial banks and directly from the enterprises that have borrowed from non-residents. The accruals principle is not applied. Income on trade credits is not included. Income on reserve assets is recorded monthly on an actual basis.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
The accruals principle is not applied to all items. Income on trade credits is not included. Income on financial derivatives is included under income and not recorded under financial derivatives.

6.3 GAPS
None.

6.4 INTENDED HARMONISATION
Further refinement of the compilation techniques is necessary, particularly with regard to the application of the accruals principle where possible.
6.5 ESTIMATION METHODS

None.

7 CURRENT TRANSFERS

The Bulgarian National Bank receives information on current transfers from the monthly reports of commercial banks for transfers in cash, as well as information from the Ministry of Finance on the respective pre-accession funds received from the EU. For current transfers in kind, quarterly data are obtained from various agencies, ministries, etc.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

None.

8.2 DEFINITION

In line with the definition of the BPM5, the capital account consists of two categories: (i) capital transfers; and (ii) the acquisition or disposal of non-produced, non-financial assets. If in kind, a capital transfer consists of: (i) a transfer of ownership of fixed assets; or (ii) forgiveness of a liability by a creditor when no counterpart is received in return. If in cash, a transfer is a capital transfer when it is linked to, or conditional upon, the acquisition or disposal of fixed assets (e.g. an investment grant).

The main sources of information on private transfers are the banks’ and companies’ reports. For government transfers, data are obtained directly from the Ministry of Finance and from any other ministry concerned.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

8.4 GAPS

None.

8.5 INTENDED HARMONISATION

No harmonisation is necessary.

8.6 ESTIMATION METHODS

None.

9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

None.

9.1.1 DIRECT INVESTMENT IN THE COUNTRY

For the compilation of direct investment in the country, the Bulgarian National Bank collects data from the following sources:

- the Privatisation Agency;
- commercial banks;
- the NSI;
- foreign investment enterprises in the non-financial sector;
- the Central Depository;
- the Agency for Financial Supervision; and
- notaries public.

The Privatisation Agency provides monthly data on sales of the state’s shares in the capital of Bulgarian enterprises to non-residents, which are included under the equity capital item. The Bulgarian National Bank only reports on what has actually been accomplished and not on contracted receipts from privatisation deals.

The Agency for Financial Supervision provides quarterly data on non-residents’ participations in the capital of Bulgarian insurance and pension companies. Flows are derived from the stock data and are included under the item equity capital.

Notaries public provide monthly data on non-residents’ purchases of real estate in the country. Data are included under equity capital.
The Central Depository provides monthly data on the shares purchased and sold by non-residents, whose participation in the capital of the company is at least 10%, as well as on the average monthly market prices of the shares of the separate issues.

Data from the commercial banks are collected through the reporting forms B-1 and B-3, as well as through the commercial banks’ annual financial statements and from the Banking Supervision Department of the Bulgarian National Bank on non-resident investment/disinvestment in the equity capital.

Non-financial sector enterprise data is collected through the forms SPB-1 and SPB-4. Quarterly surveys of the largest foreign direct investment companies are carried out by the Bulgarian National Bank, providing data on their equity capital, other capital and reinvested earnings.

The NSI provides data on non-privatisation transactions to the Bulgarian National Bank from its quarterly and annual statistical surveys on FDI conducted among non-financial sector enterprises. Data from different sources are compared and checked for consistency in order to avoid double-counting.

9.1.2 DIRECT INVESTMENT ABROAD
For the compilation of data on direct investment abroad, the Bulgarian National Bank collects information from the following sources:

- the statistical register for direct investment abroad;
- quarterly reporting forms on the equity capital (Form SPB-7);
- reports on the inter-company financial loans (Form SPB-4); and
- commercial bank reports (Form B-3).

Breakdowns by sector and by country are available for both direct investment transactions in the country and abroad, as they are classified according to the economic activity of the resident enterprise.

9.2 DEFINITION
When compiling the direct investment in the country, the Bulgarian National Bank adheres to the international conventions and requirements set out in the BPM5 and in the OECD’s “Benchmark Definition of Foreign Direct Investment”, third edition, 1996. In accordance with these requirements, a direct investment in the country is an international investment, in which the direct investor, a resident of a foreign economy, acquires a lasting interest in an enterprise that is resident in the Bulgarian economy (direct investment enterprise). The direct investment includes both the initial transaction through which the relationship between the direct investor and the direct investment enterprise is established and all subsequent transactions between them. The transactions can involve both an increase/decrease in the liabilities of the direct investment enterprise vis-à-vis the direct investor and an increase/decrease in the claims of the direct investment enterprise on the direct investor. The Bulgarian National Bank therefore reports both accomplished investment and disinvestment. The basic principles of the reporting of direct investment in the country are: first, only actually received and not contracted amounts are recorded and, second, when financial instruments are used for settlements, they must be recorded at their market price and not at their nominal value. The Bulgarian compilation methodology adheres strictly to the rule adopted by the BPM5 that the acquisition of 10% or more of the voting power in the management of the investment enterprise is considered an establishment of a direct investment relationship.

Direct investment in the country and abroad items of the Bulgarian b.o.p. comprise:

(i) **Equity capital** – the acquisition/disposal of shares and equities (in cash and in kind) by direct investors in the share or equity capital of direct investment enterprises. The acquisition of equities and shares in the capital is reported as an
increase and the disposal as a decrease in direct investment.

(ii) Other capital – the principal received and paid on loans (both short and long-term) between the direct investor and the direct investment enterprise. The receipt of a loan from the direct investor is treated as an increase of the direct investment and the repayment of the principal as a decrease. The extension of a loan by the direct investment enterprise to the direct investor is treated as a decrease in the direct investment and the repayment of the principal as an increase.

(iii) Reinvested earnings – the share of the direct investors in the undistributed earnings/losses of the enterprise for the reporting period. The share in the undistributed earnings is reported as an increase of the direct investment in the country and the share in the loss as a decrease. In line with requirements, an offsetting entry is recorded in the case of reinvested earnings.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

Reinvested earnings are derived by deducting the net profit/loss for the reporting period from the amount of dividends to be paid to shareholders.

9.4 GAPS

None.

9.5 INTENDED HARMONISATION

No harmonisation is envisaged.

9.6 ESTIMATION METHODS

Reinvested earnings are derived as the net profit for the reporting period less the amount of dividends paid to shareholders. However, the actual amount of dividends to be paid is not available until the next year, when the decision to distribute dividends is made. For this purpose, the net profit/loss of non-residents for the current year is diminished by the amount of projected dividends (based on the net profit/dividend ratio in the previous year, which is used as an estimate). That estimation of the net reinvested earnings for the current period is included as preliminary data in the b.o.p., and is replaced by final data when the actual amount of dividends paid is available. Net losses are included with a negative sign.

10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Data on the asset side of portfolio investment are provided by commercial banks, the Bulgarian National Bank and the Ministry of Finance. The main source of information on the liability side of portfolio investment is the data provided by the Ministry of Finance, the Bulgarian National Bank, commercial banks and the Central Depository. For both the asset and the liability sides, data are collected on an aggregated basis. Security-by-security data are reported by the Central Depository, the Fiscal Services Department and the Issue Department of the Bulgarian National Bank, and the Ministry of Finance.

10.2 DEFINITION

In line with the BPM5, the portfolio investment item in the Bulgarian b.o.p. covers transactions in shares and equity if the investor’s share in the capital is less than 10%, transactions in bonds, notes, money market and other tradable securities, and transactions in financial derivatives. At present, transactions in financial derivatives are also included in the portfolio investment item.

The accruals principle for portfolio investment income is applied to only a few instruments – collateral on Bulgarian Brady Bonds on the asset side and Bulgarian government securities on the liabilities side. For these cases, an
offsetting entry is recorded with regard to the underlying financial instrument.

Due to the existing methodology for compiling the portfolio investment item, service charges and commissions are excluded and are recorded as services where identifiable.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

At present, transactions in financial derivatives are also included in the portfolio investment item. The accruals principle is not followed for all items.

10.4 GAPS

None.

10.5 INTENDED HARMONISATION

None.

10.6 ESTIMATION METHODS

Accruals (where applied) are estimated on the basis of the discount and interest rates of each separate issue.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

There are no specific features for data collection for this item – it is a part of the general reporting system. The sources of information are the commercial banks’ monthly reports.

11.2 DEFINITION

See Sub-section 11.1.

11.3 DEVIATIONS FROM AGREED DEFINITIONS

At present, transactions in financial derivatives are not recorded as a separate item, but are included in the portfolio investment item.

11.4 GAPS

See Sub-section 11.1.

11.5 INTENDED HARMONISATION

The Bulgarian National Bank plans to design and implement a special survey on financial derivatives, and to conduct a monthly survey among commercial banks and non-financial enterprises on their portfolio assets.

11.6 ESTIMATION METHODS

See Sub-section 11.1.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

For liabilities, the main source of information for financial loans of commercial banks is Form B-7 and, for financial loans of companies, Form SPB-4 (quarterly). According to Article 7 of the Foreign Exchange Law and Regulation No 27, all loans received by residents and non-residents (except for households) have to be declared to the Bulgarian National Bank for statistical purposes and reported upon quarterly. The BOPED Division holds a statistical register of non-guaranteed external debt, which contains detailed information on flows and stocks. This register allows a differentiation between intra-company and other debt, as well as sector, instrument, maturity, country and currency breakdowns. The same information is available on government and government-guaranteed loans through the Ministry of Finance.

Regarding the asset side, data are received from commercial bank reports (Form B-7) and through direct reporting from local companies with loans to non-residents (Form SPB-4). Data on the liability side of the loans item are sent by the Ministry of Finance.
Data on trade credits are reported quarterly by enterprises using Form SPB-6A for their assets with non-residents and Form SPB-6B for their liabilities to non-residents. These forms also gather data on inter-company trade credits.

12.2 DEFINITIONS

In line with the definitions in the BPM5, other investment covers trade credits, loans, currency and deposits and other assets and liabilities. According to the b.o.p. conventions, trade credits arise from the direct extension of credit from a supplier to a buyer, i.e. this is a credit extended by a trade partner without a tradable security being issued.

The loans item includes received and paid principal on short and long-term loans between residents and non-residents if a tradable security is not issued with these loans.

The currency and deposits component on the asset side lists the changes in the residents’ currency and deposits held with non-residents. At present, data from companies with bank accounts abroad and BIS data are used. On the liability side, data on the changes in the liabilities of resident commercial banks to non-residents in domestic and foreign currency are obtained directly from the banks’ reports. Following the basic accounting principles and conventions laid down in the BPM5, the Bulgarian National Bank excludes any fluctuations in the exchange rate when compiling this item.

The other assets and other liabilities items include all transactions receivable and payable on miscellaneous accounts not included elsewhere, as well as transactions in arrears.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

The entries under this category pertain to transactions in the Bulgarian National Bank’s external holdings that are administered by the Issue Department. The data on reserve assets exclude exchange rate fluctuations.

13.2 DEFINITION

Reserve assets include those external assets that are readily available to and controlled by the central bank (government) for the direct financing of b.o.p. imbalances. The reserve assets comprise monetary gold, special drawing rights (SDRs), reserve positions in the IMF, foreign exchange assets (consisting of currency and deposits and securities) and other claims.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.
14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The i.i.p. statement is compiled in general conformity with the international standards prescribed by the BPM5 and the “International Investment Position – A Guide to Data Sources” (IMF, 2002). The i.i.p. statement is compiled and published annually.

The i.i.p. is the balance sheet of the country’s stocks of external financial assets and liabilities at the end of a specific period. The external financial assets consist of direct investment, portfolio investment, financial derivatives, other investment and reserve assets. The external financial liabilities consist of direct investment, portfolio investment, financial derivatives and other investment and, therefore, they are a broader concept than the liabilities that constitute the country’s gross external debt. The primary type of classification in the i.i.p. statement is the distinction between assets and liabilities. The second level of classification by function is fully consistent with the b.o.p. financial account. The functional types of assets and liabilities are (i) direct investment, (ii) portfolio investment, (iii) financial derivatives and (iv) other investment. Included in assets are also the reserve assets held by the monetary authorities. The third level of classification is by investment instrument; instruments recorded as portfolio investment and other investment are further sub-divided by domestic sector, while the components of other investment are also cross-classified by original maturity.

14.1.2 DIRECT INVESTMENT

Direct investment is a category of international investment in which a resident of one economy – a direct investor – holds a lasting interest (at least 10% of the ordinary shares or voting power) in an enterprise resident in another economy – a direct investment enterprise. It is recorded on a directional basis: direct investment abroad as an asset and direct investment in the reporting country as a liability. The direct investment stocks covers claims and liabilities in equity capital and reinvested earnings, as well as other capital (inter-company debt).

Preliminary data on FDI stocks are estimated as stocks at the end of previous year plus b.o.p. flows. Later, the stocks of Bulgarian direct investment abroad are replaced with data from an annual survey. The stocks of direct investment in Bulgaria are replaced with information provided by the NSI on direct investment in the non-banking sector, information provided by the commercial banks on direct investment in the banking sector and data from the Bulgarian National Bank surveys regarding major FDI non-financial sector companies. Breakdowns by sector and by country for both FDI in Bulgaria and abroad are available. For direct investment abroad, a breakdown by currency is also available.

14.1.3 PORTFOLIO INVESTMENT

Portfolio investment stocks comprise holdings of and liabilities on equity securities and debt securities; the latter are sub-divided into bonds and notes (with an original maturity of one year or more) and money market instruments (with an original maturity of less than one year). The portfolio investment assets of the monetary authorities and the general government are compiled on the basis of information provided by the Fiscal Services Department of the Bulgarian National Bank and the Ministry of Finance. These holdings of securities do not constitute a part of the reserve assets. The portfolio investment assets of the commercial banks’ holdings of securities are compiled on the basis of balance sheet data, while the other sectors’ portfolio investment assets are estimated as the cumulative sum of the flows recorded in the b.o.p. statement.

The stocks of portfolio investment liabilities cover securities issued by residents and held by non-residents. The main sources of information on the portfolio investment liabilities in equity securities are (i) the commercial banks’ balance sheets on portfolio investment in the banking
sector and (ii) the Central Depository which provides flow information on the portfolio investment in the non-banking sector. The stocks relating to the non-banking sector are estimated as the cumulative sum of the b.o.p. flows. The Ministry of Finance, the Bulgarian National Bank and the commercial banks are the main sources of information on the portfolio investment liabilities in debt securities of the monetary authorities and the general government. The portfolio investment liabilities in debt securities of the commercial banks and the other sectors are estimated as the cumulative sum of the b.o.p. flows.

14.1.4 FINANCIAL DERIVATIVES
Assets and liabilities in financial derivatives cover financial derivative instruments such as forwards, futures, swaps, options, etc. The Bulgarian National Bank does not currently obtain stock information on this i.i.p. component.

14.1.5 OTHER INVESTMENT
Other investment covers the stocks of assets and liabilities relating to short and long-term trade credits and loans, currency and deposits and other accounts receivable and payable.

According to the BPM5, trade credits consist of claims and liabilities arising from the direct extension of credit by suppliers and buyers for transactions in goods and services and advance payments for work in progress (or to be undertaken) that is associated with such transactions. The source of information for trade credit assets is Form SPB-6A, while for trade credit liabilities it is Form SPB-6B.

The Bulgarian National Bank compiles stock data on loans extended by resident entities to non-residents, i.e. assets, on the basis of information in the Bulgarian National Bank’s and commercial banks’ balance sheets. These data cover the monetary authorities, general government and commercial banks; data for the other sectors for the 2000 i.i.p. and onwards are available from Form SPB-4. On the liability side, the Bulgarian National Bank compiles data on loans received by the monetary authorities and the general government on the basis of information from the Ministry of Finance, from the Bulgarian National Bank, from non-financial sector reporting agents through Form SPB-4 and from commercial banks for their financial loans using Form B-7. In accordance with the BPM5, the credit and loans from the IMF are recorded as liabilities of the Bulgarian National Bank in both the b.o.p. and the i.i.p., regardless of whether they are extended to the Bulgarian National Bank or to the Ministry of Finance. Commercial banks, enterprises and individuals provide data on the banks and other sectors.

On the asset side, the currency and deposits component represents the stock of foreign currency and deposits held by residents. For the banking sector, data are obtained from the commercial banks’ balance sheets; for the other sectors, information is provided by companies with bank accounts abroad and by the BIS. On the liability side, the deposits of non-residents held with domestic banks in both national and foreign currency are recorded on the basis of information from the commercial banks’ reports.

The other assets and other liabilities components cover miscellaneous claims and liabilities vis-à-vis non-residents not included in the other items. Included in these components are also arrears on both (i) loans provided by residents to non-residents, which are recorded under assets, and (ii) loans received by residents from abroad, which are recorded as liabilities.

14.1.6 RESERVE ASSETS
According to the BPM5, reserve assets consist of those external assets that are readily available to and controlled by monetary authorities for direct financing of payments imbalances, for indirectly regulating the magnitude of such imbalances through intervention in exchange markets to affect the currency exchange rate and/or for other purposes. The reserve assets comprise monetary gold, SDRs, the reserve...
position in the Fund, foreign exchange assets (consisting of currency and deposits and securities) and other claims. Under the provisions of the currency board, the reserve assets of the Bulgarian National Bank are equal to the assets of the Issue Department as presented in its balance sheet.

14.2 DEVIATIONS FROM AGREED DEFINITIONS

The valuation of the reserve assets is performed in accordance with the National Accounting Standards and the Law on the Bulgarian National Bank. According to Article 28 (3), item 6, of the Law on the Bulgarian National Bank, the stock of monetary gold shall be valued at DEM 500 per troy ounce, or at the market value, whichever is lower.

14.3 GAPS

None.

14.4 INTENDED HARMONISATION

The Bulgarian National Bank plans to elaborate and implement a special survey on financial derivatives.

14.5 ESTIMATION METHODS

None.

5.2 ROMANIA

ORGANISATION CHART

Banca Naţională a României

Governor

As of 15 April 2004
2 INSTITUTIONAL ASPECTS

2.1 INTRODUCTION

The institution responsible for the compilation of balance of payments (b.o.p.) and international investment position (i.i.p.) statistics in Romania is the Banca Naţională a României through its Statistics Department. Monthly and annual data have been compiled since 1993, following the recommendation of the 5th edition of the IMF Balance of Payments Manual (BPM5). The Banca Naţională a României, which is the national central bank, may act independently from the Government and cooperates with the central and local public authorities to achieve its targets. The Board of the Banca Naţională a României is appointed by the Romanian Parliament.

2.2 LEGISLATIVE PROVISIONS

The legal basis for the compilation of the b.o.p. is provided by Law No 312/2004 regarding the Statute of the Banca Naţională a României, which empowers the Banca Naţională a României to require information needed for b.o.p. compilation, and Circular No 7/1994, which enables the Banca Naţională a României to collect b.o.p. data from the commercial banks. According to this regulation, the commercial banks must record and report b.o.p. transactions, as they are defined in the circular, to the Banca Naţională a României on a monthly basis. In the case of non-compliance with the legal requirements, the Banca Naţională a României may issue written warnings to and impose fines on reporting agents.

2.3 INTERNAL ORGANISATION

The statistical activities of the Banca Naţională a României are centralised in the Statistics Department, which comprises four divisions: the Monetary and Financial Statistics Divisions, the Balance of Payments Division, the Direct Statistical Reporting Division, and the Statistical Applications Development and Data Processing Division. At present, 21 people are involved with b.o.p. statistics. The Balance of Payments Division collects data from all reporting banks and other sources (customs, Government, agencies, etc.), maintains contact with the reporting community and is responsible for methodological issues. It should be noted that, within the reporting community, banks codify transactions on the basis of the b.o.p. principle, applying double-entry accounting. While the Statistical Applications Development and Data Processing Division receives the data in electronic format and is responsible for aggregating the information (one person from this division supervises the process), the Balance of Payments Division is responsible for the final compilation of the b.o.p., produces tables and analyses, and disseminates the data in the required format to Eurostat, the International Monetary Fund (IMF), users within the Banca Naţională a României, etc.

2.4 EXTERNAL COOPERATION

The Banca Naţională a României cooperates with the National Customs Authority (NCA) and the National Institute for Statistics (NIS) in the area of foreign trade statistics. The trade data are published monthly in the NIS’s Statistics Bulletin. The classification of accounts and definitions regarding foreign trade statistics are largely in line with the recommendations of the BPM5. In the area of national accounts, the principles of the System of National Accounts (SNA) 1993 and of the European System of Accounts (ESA) 1995 are used.

The Government provides information for specific b.o.p. items, such as:

- expenses of Romania’s diplomatic missions abroad, submitted once a year by the Ministry of Foreign Affairs;

- some information on grants received, available from the Ministry of Public Finance (MoPF);
estimates of general government debt forgiveness; and

information on public and publicly guaranteed external debt, available from the MoPF.

The Banca Naţională a României cooperates with Eurostat, the European Central Bank (ECB) and the IMF in the b.o.p. methodology area by participating in international meetings, working parties, seminars and statistical missions in order to harmonise national standards with the international criteria.

2.5 USERS

The monthly b.o.p. is externally disseminated to the Government, the National Institute of Statistics (NIS), the Institute for Macroeconomic Studies and the branch offices of international organisations such as the International Bank for Reconstruction and Development (IBRD) and the IMF Mission in Bucharest. B.o.p. data are also provided on a regular basis to Eurostat and the ECB in GESMES/CB format and to the IMF via the internet.

Within the Banca Naţională a României, it is distributed to the Monetary Policy Department, the Market Operation Department, the European Integration Department and the Research (Economic Studies) and Publications Department. In addition, the executive management of the Banca Naţională a României receives b.o.p. (tables and analysis) on a monthly basis.

3 STATISTICAL SYSTEM

3.1 TYPE OF COLLECTION SYSTEM

The collection system used to report b.o.p. data is an International Transaction Reporting System (ITRS) of a semi-open type based on the collection of settlement data. Statistics are compiled from forms submitted monthly by commercial banks and containing aggregate figures on the external transactions of their customers, as well as transactions made for their own account. For each of these external transactions, it is assumed that an entry is made in the financial account to offset the corresponding changes in the bank’s foreign currency account.

The data are prepared monthly on a cumulative basis.

For some b.o.p. components, additional data sources are used:

- the NCA and NIS for trade data;
- bureaux de change for tourism;
- the Debt Management and Financial Analysis System (DMFAS): a database which is the joint responsibility of the MoPF and the Banca Naţională a României, used for monitoring Romania’s external debt. Borrowers report medium and long-term credits contracted from non-residents directly to the MoPF and the Banca Naţională a României. While the MoPF manages public and publicly guaranteed external debt, the Banca Naţională a României monitors the private sector’s external debt. Information is keyed into the database on a transaction-by-transaction basis. Details regarding debt securities transactions and interest payable are also entered into the database. For b.o.p. purposes, real flow data are available. Transactions denominated in other currencies are converted into euro at the rates applicable at the time of transaction;
- the Banca Naţională a României’s balance sheet provided by the Accounting Department is used for estimated reserve asset transactions. Adjustments are made for changes in valuation due to exchange rate fluctuations; and

- the Banca Naţională a României’s balance sheet provided by the Accounting Department is used for estimated reserve asset transactions. Adjustments are made for changes in valuation due to exchange rate fluctuations; and
The b.o.p. data are compiled in euro. Wherever possible, transactions denominated in other currencies are converted into euro at the exchange rates applicable at the time. For data derived from the balance sheets, the exchange rate applicable at the end of the period is used. A currency breakdown is only available for reserve assets and debt flows.

A geographical breakdown is available for exports and imports of general merchandise and for information obtained from the DMFAS (medium and long-term loans and credits received, income payable, debt securities, etc.).

3.2 REPORTING AGENTS

(i) **Banking sector**: the banks are required to report all external transactions undertaken on behalf of their customers and for their own account. The banks themselves assess whether a transaction is a b.o.p. transaction or not, and allocate the operation by type of b.o.p. transaction. According to the double-entry principle, an entry should be made in the financial account for these external transactions in order to offset the corresponding changes in the bank’s foreign currency account.

(ii) **Monetary authority sector**: the Banca Naţională a României provides data on reserve assets and other transactions involving the monetary authorities.

(iii) **General government sector**: data regarding the general government’s medium and long-term liabilities are provided by the DMFAS (the primary source of these data is the MoPF). Grants received by Romania are monitored by a special unit of the MoPF.

3.3 THRESHOLDS

For the time being, no thresholds are used in the Romanian data collection system.

3.4 AVAILABILITY OF DATA

Romania’s b.o.p. data are compiled on a monthly basis by the Statistics Department of the Banca Naţională a României and are disseminated approximately 45 days after the end of the reference period. Data are published on a cumulative basis as each month’s data are produced. Revised annual figures are available approximately six months after the year-end. To the extent allowed by the data collection methodology, the classification of accounts and definitions used in Romania’s b.o.p. follow the guidelines of the BPM5. While a geographical breakdown is available only for the trade balance and medium and long-term credits received, an institutional sector breakdown is available for all the components of the financial account.

Romania’s i.i.p. is produced on a quarterly and annual basis by the Banca Naţională a României’s Statistics Department. The quarterly i.i.p. is compiled approximately two months after the end of the reporting period and annual figures are available six months after the year-end.

The i.i.p. data are largely consistent with the corresponding financial account items in the b.o.p., in accordance with a recommendation of the BPM5.

3.5 DATA CONTROLS

Banks report b.o.p. data on an aggregate basis, and it is therefore often difficult to check the data. Controls are carried out mainly on the items of the financial account; for example, it is possible to verify whether repayments of loans exceed disbursements. For some financial account transactions, such as transactions made by banks for their own account, monetary balance sheet data are compared with the

Information received from the banks, in accordance with the Romanian Balance of Payments Regulation.

### 3.6 Revision Policy

If necessary, data are revised on a quarterly basis. Revised annual data, published in the Banca Naţională a României’s Annual Report, are disseminated after approval by Parliament.

### 3.7 Dissemination

Romania’s b.o.p. data are disseminated through the Banca Naţională a României’s website (http://www.bnro.ro) and are also published in the Banca Naţională a României’s Monthly Bulletin, Annual Report, and Balance of Payments and International Investment Position Annual Report. The information is posted on the Banca Naţională a României’s website approximately two weeks before publication.

Romania participates in the IMF’s General Data Dissemination System (GDDS) and uses this system as a framework for statistical development.

### 4 Goods

### 4.1 Specific Features of Data Collection

Exports and imports of goods are recorded in the b.o.p. based on customs data provided on a monthly basis by the NCA. The NCA processes
customs declarations (made on the Single Administrative Document for Europe) and statistical reports drawn up for some categories of goods transported by cable or pipeline (such as crude oil, natural gas and electricity). Customs statistics are based on the foreign trade methodology of the NIS, which is aligned with that of Eurostat.

4.2 DEFINITION

The primary source of data is the foreign trade statistics, which is currently the only reliable data source. The data included in foreign trade statistics are classified according to the Combined Nomenclature of the European Union. The NCA passes these data on to the NIS for official dissemination.

Imports are available on a c.i.f. basis and are converted to an f.o.b. basis by the Banca Naţională a României, using a transformation coefficient (1.0834 at present) periodically calculated by the NIS (on the basis of a survey of key commercial companies).

The NIS groups the countries together by continent, according to Eurostat recommendations, and by the level of development, according to United Nations recommendations (developed countries, transition countries and developing countries).

4.3 DEVIATIONS FROM AGREED DEFINITIONS

With the entry into force of the Romanian Customs Code (approved by Law No 141/1997) on 1 October 1997, which brought the country’s customs statistics into line with European Community regulations and procedures, the problem of goods identification was resolved thanks to the alignment of customs and statistical procedures. Nevertheless, there are still some codification problems.

4.4 GAPS

None.

4.5 INTENDED HARMONISATION

Starting with 2005, the trade balance will include the five requested categories: general merchandise, goods for processing, repair on goods, goods procured in ports by carriers, non-monetary gold.

4.6 ESTIMATION METHODS

No estimation methods are used for the goods item. A commodity breakdown is available when trade data are released by the NIS. Estimates are used for forecasting only. Nevertheless, in current account projection, trade data are estimated for each goods section in accordance with the Standard International Trade Classification (SITC, Rev. 3).

5 SERVICES

5.1 SPECIFIC FEATURES OF DATA COLLECTION

As a heterogeneous position, many data sources are implied, with the primary source being banking data flows. The items requiring the use of other sources are: merchandise transport, foreign exchange through bureaux de change, embassy and consulate-related services, other business services, and professional and technical services.

A special case is the travel item. Data reported by banks and bureaux de change have mainly been used for compiling the travel balance, although these two sources do not cover the whole range of transactions.

5.2 DEFINITION

The current methodology for compiling services is largely in line with the BPM5. Data on financial services are collected through the banking system.

</tbody>
</table>

1) Available on an annual basis.
5.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

5.4 GAPS

Receipts related to business travel and transactions with credit cards are not covered by the data collection system. It is assumed that the travel debits estimate is overstated, as not all foreign exchange purchased by residents is used for travelling abroad.

5.5 INTENDED HARMONISATION

To improve the quality of the travel data, supplementary data sources (such as reporting on accounts held abroad by enterprises and the reporting of transactions with credit cards) are envisaged in order to create a mixed data collection system in this field. A better estimation method will be introduced for compiling the debit entries regarding amounts of foreign exchange spent abroad by Romanian travellers.

5.6 ESTIMATION METHODS

An estimate is made so that the amounts of foreign exchange sold/purchased by residents through bureaux de change, which are not related to travel, do not have to be recorded in the travel balance. The method of estimation is basically as follows:

- credit entries are calculated as the difference between the amounts of foreign exchange sold and purchased by non-residents; and
- for debit entries, an assumption is made on the amounts of foreign exchange spent by residents abroad, taking into account the number of residents’ trips abroad,1 the evolution of foreign currency purchases by individuals, seasonal influences, the purchasing power index.

Estimation methods are also used for export freight services provided by residents and for import freight provided by non-residents:

- since the ITRS does not cover the whole range of transactions related to export freight, an adjustment is made to data provided by banks, which are supposed to reflect freight paid on exports by non-residents to resident operators, by adding an estimated value of freight paid to resident operators on exports by exporters themselves;
- in the case of debits, assuming that the c.i.f. - f.o.b. difference refers to transportation and insurance expenses, it is important to assess what is the weight of the transportation services performed by non-residents in the total transportation payments (for the valuation of imports on an f.o.b. basis, see Section 4 on goods). Insurance costs are calculated applying an average insurance rate to the imports calculated on a c.i.f. basis. Furthermore, insurance costs are deducted from the c.i.f./f.o.b. difference. A breakdown of imports by carriers and by mode of transportation is available from the GDC. Therefore, it is possible to assess what part from the c.i.f./f.o.b. difference reflects freight performed by non-resident operators for residents.

6 INCOME

6.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

Data regarding income balances are collected through banking and non-banking sources. Transactions involving compensation of employees, direct and portfolio investment income are covered by the data collection system.

1 Provided quarterly by the NIS.
Bank reporting is the main source for compiling income data. Data are submitted monthly on an aggregated basis and are cumulated from the beginning of the year.

A non-banking source is used for compiling other investment income in the form of interest paid on medium and long-term credits. This source is the DMFAS, which is based on direct reporting by companies.

6.1.1 COMPENSATION OF EMPLOYEES
Data are collected from banks and mainly concern compensation paid to Romanian residents by foreign employers for seasonal or short-term work.

6.1.2 INCOME ON DIRECT INVESTMENT
Direct investment income is derived from the ITRS. Consequently, the data only include dividends and interest paid in cash. Data for direct investment income paid in kind are not available. Reinvested earnings are not included in this item as, for the time being, these data are not being estimated. Data supplied by banks concern both income on equity and income on debt.

Compilation of direct investment income complies partially with the principles set out in the BPM5.

6.1.3 INCOME ON PORTFOLIO INVESTMENT
For income on equity, commercial bank reports are used. Dividends refer to shareholdings of less than 10% of an enterprise’s total capital. The collection of data regarding income on debt is based on the ITRS, combined with information supplied by the DMFAS. This system measures actual interest payments to non-residents on medium and long-term debt securities during a specified period of time. In addition, the Banca Naţională a României provides information on its own receipts from the management of portfolio securities.

Data are available broken down by instrument and institutional sector.

6.1.4 INCOME ON OTHER INVESTMENT
Data sources are in this case the ITRS, Banca Naţională a României reports and the DMFAS. The latter records income on both government debt (public and publicly guaranteed debt) and private sector debt. Further income flows are derived from reports submitted by commercial banks to the Banca Naţională a României and from the Banca Naţională a României’s own records. Furthermore, interest on short-term trade credits is provided by bank reports and interest on long-term trade credits by the DMFAS.

6.2 DEVIATIONS FROM AGREED DEFINITIONS
Income receipts and payments are compiled on a cash basis. The data are derived from the ITRS, which does not allow data on interest to be compiled on an accruals basis.

6.3 GAPS
Direct investment income paid in kind and reinvested earnings (and other undistributed earnings) are not included.

It is not possible to check income data provided by commercial banks. In addition, Romania’s ITRS has only limited coverage of transaction types.

6.4 INTENDED HARMONISATION
A foreign direct investment (FDI) survey will be introduced with the aim of monitoring FDI in Romania and Romanian direct investment abroad. Data regarding reinvested earnings stocks will be provided via this survey.

As soon as this survey is introduced, an estimation method will be devised to compile monthly flows related to reinvested earnings.

6.5 ESTIMATION METHODS
No estimation methods are currently used for income.
7 CURRENT TRANSFERS

(i) General government: data are obtained from bank reports and mainly cover subsidies granted by non-residents for current budget support, as well as the Government’s contributions to the administrative budgets of international organisations. Furthermore, technical assistance under governmental programmes (e.g. the PHARE programme) is recorded under general government transfers.

(ii) Other current transfers: additional information concerning aid, donations and contributions to various organisations is recorded under private transfers. The Statistics Department obtains these data from import statistics. Workers’ remittances are captured via the ITRS and are included in current transfers of the private sector.

8 CAPITAL ACCOUNT

8.1 SPECIFIC FEATURES OF DATA COLLECTION

Capital transfers:

(i) General government debt forgiveness: this is estimated on the basis of the Government’s budgetary documents and information from bank accounts. Debt forgiveness is not a regular occurrence in Romania. Acquisition of equipment under governmental technical assistance programmes is included in this position.

(ii) Private transfers: monthly, the Statistics Department receives information from the MoPF on financial aid. Depending on the nature of the assistance provided, transactions are assigned to capital transfers if, for example, equipment is acquired from abroad (with an offsetting entry under imports), or to current transfers (with an offsetting entry under services for the total value of the technical assistance). In addition, the forgiveness of debt of private companies is taken into account whenever it occurs.

8.2 DEFINITION

In Romania’s b.o.p., current and capital transfers are compiled separately and they are recorded in the current and capital accounts, respectively. Following the recommendations of the BPM5, the criteria used to distinguish current transfers from capital transfers are linked to the definition of capital transfers:

- a transfer in kind is a capital transfer when it is related to the transfer of ownership of a fixed asset;
- a transfer in cash is a capital transfer when it is linked to, or conditional upon, the acquisition or disposal of a fixed asset by one or both parties to the transaction; and
- the forgiveness of a liability by a creditor is a capital transfer when no counterpart is received in return.

All other transfers are considered current transfers.

The definitions used for compiling current and capital transfers are theoretically in line with those recommended by the BPM5.

8.3 DEVIATIONS FROM AGREED DEFINITIONS

A distinction between current and capital transfers is not always possible; some capital transfers may be included in current transfers.

8.4 GAPS

At present, it appears that some grants and other aid flows related to capital projects are not being recorded.

Estimates of migrants’ transfers are recorded in the b.o.p. to the extent allowed by the data
9 DIRECT INVESTMENT

9.1 SPECIFIC FEATURES OF DATA COLLECTION

As noted under income on direct investment above, data on FDI and Romanian investment abroad are derived mainly from banking data collected through the ITRS. Therefore, these data measure only cash transactions by direct investment enterprises with parent companies. In addition, in order to include non-cash direct investment (i.e. in kind), some adjusted customs data are taken into consideration. These data are to some extent approximate, as they cannot always be extracted from the general trade data. As for direct investment by the banking sector, some information about other capital is derived from bank balance sheets.

Data are available broken down into two of the three major components of direct investment: equity capital and other capital. However, the accuracy of the data, especially for other capital, is limited by two factors: the inadequate coverage of the ITRS and the sometimes inaccurate assessments by compilers at commercial banks. Some other information is captured through the mass media. Regarding the liabilities side of other capital, accurate data on medium and long-term borrowings are obtained from the DMFAS.

The collection system does not, for the time being, allow for any breakdowns, whether by region or by economic sector.

9.2 DEFINITION

The 10% ownership rule for distinguishing direct from portfolio investment is observed by the Romanian methodology. The directional principle for recording transactions is also followed, with the exception of other capital, which is only included on a net basis for investment abroad and investment in Romania. Coverage of inter-company loans is limited to parent-subsidiary transactions. Furthermore, the current collection system is unable to capture intra-group transactions.

As mentioned in Sub-section 6.1.2, reinvested earnings are not included because no data source is available.

All transactions in cash effected through the banking system are included in the b.o.p. when payments are made.

9.3 DEVIATIONS FROM AGREED DEFINITIONS

As explained in Sub-sections 9.1 and 9.2, there are some deviations from BPM5 recommendations. For example, data on reinvested earnings are missing, only partial records exist in respect of the assets/liabilities principle for other capital, trade credits are not included in other capital, and securities between affiliates are not captured under direct investment.

9.4 GAPS

See Sub-section 9.3.

9.5 INTENDED HARMONISATION

In 2003 the Banca Naţională a României, in cooperation with the NIS, conducted a first survey of inward FDI. For reasons of insufficient quality, the results will not be published. The second survey will be conducted in 2004, relating to the year 2003. This survey is now part of the research programme and is included in the budget of the NIS.

The Banca Naţională a României is planning to conduct in the near future an annual survey of outward FDI to measure direct investment abroad more accurately.

9.6 ESTIMATION METHODS

None.
10 PORTFOLIO INVESTMENT

10.1 SPECIFIC FEATURES OF DATA COLLECTION

Several complementary sources are used to compile portfolio investment in order to obtain a more realistic picture of these transactions. Data on portfolio investment are derived from the ITRS, especially for transactions in equity shares on the assets side. These data are supplemented by data transmitted by the domestic financial market and the DMFAS, the main source for data on medium and long-term debt securities, including the Banca Naţională a României’s own portfolio investments. For some items (e.g. portfolio securities held by banks), data are derived from asset holdings recorded in banks’ balance sheets. At the same time, in the case of bank liabilities, the bank balance sheets and the DMFAS are cross-checked. With the exception of the DMFAS, all other sources provide data on an aggregated basis.

The present collection system allows for a full institutional sector breakdown and an instrument breakdown, the main distinction being between equity securities and debt securities.

A breakdown by country is available only for other sectors’ medium and long-term debt securities.

10.2 DEFINITION

The compilation of portfolio investment data by the Banca Naţională a României complies with the general guidelines of the BPM5. Both equity securities and debt securities are recorded under portfolio investment. While equity securities are limited to equity shares, debt securities include various instruments such as bonds and notes, and money market instruments.

Service charges, fees and commissions are excluded from portfolio investment. Information on these items is obtained from the banking settlement system and is recorded under financial services.

The accruals principle for interest income is not applied to the compilation of portfolio income, meaning that no offsetting entry is recorded under portfolio investment.

No geographical allocation of assets is available.

10.3 DEVIATIONS FROM AGREED DEFINITIONS

There are no major deviations from the BPM5 with regard to portfolio investment, other than the neglect of the accruals principle and the inclusion of some financial derivatives.

10.4 GAPS

The collection system does not allow recording on a security-by-security basis.

10.5 INTENDED HARMONISATION

In the new data collection system, banks will submit detailed reports to the Banca Naţională a României on transactions for their own account and on behalf of their customers.

10.6 ESTIMATION METHODS

None.

11 FINANCIAL DERIVATIVES

11.1 SPECIFIC FEATURES OF DATA COLLECTION

Financial derivatives are not recorded separately in the financial account, as very few options and/or futures contracts are effected on the Romanian market.

11.2 DEFINITIONS

See Sub-section 11.1.
11.3 DEVIATIONS FROM AGREED DEFINITIONS

See Sub-section 11.1.

11.4 GAPS

For the time being, it is not possible to separately identify transactions involving options contracts and futures (gains and loses), or to record them under financial derivatives.

11.5 INTENDED HARMONISATION

A new data collection system is to be set up in order to meet IMF, Eurostat and ECB criteria. Under the new system, banks will report transactions with non-residents for their own account on special forms, including a specific one for recording financial derivative transactions. The form will gather details allowing a geographical breakdown.

The approach for recording financial derivatives intended to be used in the new system is that presented in the Supplement to the BPM5.

11.6 ESTIMATION METHODS

None.

12 OTHER INVESTMENT

12.1 SPECIFIC FEATURES OF DATA COLLECTION

Information regarding other investment is available by sector (monetary authority, general government, banking system and other), by maturity and by instrument (loans, trade credits, currency and deposits, and other).

Transactions in other assets and liabilities by banks cover medium and long-term credits extended or received by the banking system and trade-related credits; for assets the data are obtained from banking flows and for liabilities from the DMFAS.

In the case of commercial banks, the stocks of liabilities reported by the DMFAS are reconciled with balance sheet information on a monthly basis.

Short-term liabilities of commercial banks are derived from balance sheet data. They are recorded on a net basis, and the data are calculated as differences between opening and closing stocks.

For the monetary authority and banks, a reconciliation of the balance sheets of the commercial banks and the Banca Naţională a României with the transactions shown in the b.o.p. is carried out periodically.

General government assets cover the medium and long-term credits extended to the former centrally planned economies (which are now mainly residual). These data are obtained from the banking system. Data on the Government’s medium and long-term liabilities are provided by the DMFAS.

Other sector assets and liabilities mainly comprise medium and long-term commercial credits contracted by the private sector. Private sector external debt is monitored on a loan-by-loan basis by the Banca Naţională a României using the DMFAS. This item also includes outstanding export and import bills, such as letters of credits, cash against documents, letters of guarantee, etc., which reflect a claim on or a liability to an importer or an exporter (taking into account the maturity distinction between medium and long-term and short-term), as well as other assets and liabilities not included elsewhere.

The Romanian b.o.p. contains a specific item recording changes in the clearing and barter accounts. The clearing and barter agreements were concluded by the Romanian Government before 1989 and most of these accounts have now been liquidated. Clearing and barter transactions are denominated in non-convertible currencies and transferable roubles. For b.o.p. purposes,
they are converted into euro. The gross changes are adjusted for exchange rate variations.

12.2 DEFINITION

The definitions used for other investment are in line with the recommendations of the BPM5. For trade credits, see Sub-section 12.1.

12.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

12.4 GAPS

None.

12.5 INTENDED HARMONISATION

None.

12.6 ESTIMATION METHODS

None.

13 RESERVE ASSETS

13.1 SPECIFIC FEATURES OF DATA COLLECTION

Reserve asset data are compiled and disseminated by the Banca Naţională a României on a monthly basis. The data are provided by the Banca Naţională a României’s Accounting Department and appear in the Bank’s balance sheet structured by instrument. The Market Operations Department provides the breakdown of the reserve assets by currency. The monthly flows are obtained from the difference between the position at the end of the current period and the position at the end of the previous year. For b.o.p. requirements, exchange rate influences are deducted from the gross figure. The exchange rate changes are obtained from the currency structure of the assets.

13.2 DEFINITION

In principle, the definitions are in line with the BPM5. Reserve assets comprise monetary gold, special drawing rights (SDRs), currency and deposits abroad, treasury bills and foreign securities. Foreign exchange assets with domestic banks are excluded.

The stock of monetary gold is valued using the price of an ounce gold on the London gold bullion market at the end of the month. Flows related to monetary gold include financial transactions only. Other reserve asset components are recorded on a net basis.

13.3 DEVIATIONS FROM AGREED DEFINITIONS

None.

13.4 GAPS

None.

13.5 INTENDED HARMONISATION

None.

13.6 ESTIMATION METHODS

None.

14 INTERNATIONAL INVESTMENT POSITION

14.1 SPECIFIC FEATURES OF DATA COLLECTION AND DEFINITIONS

14.1.1 GENERAL

The compilation of i.i.p. statistics follows, to the extent allowed by the data collection methodology, the guidelines of the BPM5, which was introduced as the framework for Romanian statistics in 1994.

The Banca Naţională a României’s Statistics Department compiles the i.i.p. in euro on a quarterly basis. Selected i.i.p. items (international reserves, external debt and other)
are published in the Banca Naţională a României’s Monthly Bulletin. The i.i.p. data are sent electronically to the IMF via the internet with a time-lag of two months. Revised annual i.i.p. data are published six months after the year-end. Sectoral and instrumental breakdowns are possible. The i.i.p. includes the stocks of direct investment, portfolio investment, other investment and reserves.

The Balance of Payments and International Investment Position Annual Report published by the Statistics Department includes stocks, flows, changes in prices and exchange rates, and other adjustments of financial external assets and liabilities vis-à-vis the rest of the world. A reconciliation between i.i.p. stocks and b.o.p. flows (including exchange rate and other adjustments) is carried out.

The data collected is a combination of pure stocks of external assets and liabilities and cumulative flows. The main statistical sources for compiling the i.i.p. are:

- commercial bank and Banca Naţională a României balance sheets;
- commercial bank reports; and
- the DMFAS.

Cumulative b.o.p. flows are recorded for direct investment and for some items in the other investment category.

14.1.2 DIRECT INVESTMENT
The Statistics Department separately compiles asset and liability stocks of direct investment on a quarterly basis. The asset position includes resident investment and contributions to banks abroad, while the liability position includes FDI in the banking and non-banking sectors and private parent-subsidiary loans.

Breakdowns by instrument, country and currency are not available for the non-banking sector, which are mainly enabled by the cumulative b.o.p. flows. Direct investment stock data for the banking sector are obtained from commercial bank balance sheets. The DMFAS is the main source of data on private parent-subsidiary loans, both for banks and non-banks. Breakdowns by instrument, currency and country are possible using the DMFAS.

The commercial bank balance sheet data are available one month after the end of the reference period and the cumulative b.o.p. flows are available two months after the reference period. The coverage and concepts are in line with the definition used in the financial account of the b.o.p.

The valuation of direct investment (both assets and liabilities) of commercial banks is based on the relevant end-of-period exchange rates.

14.1.3 PORTFOLIO INVESTMENT
Portfolio investment data are compiled and disseminated on a quarterly basis, separately for both external assets and liabilities. The asset position includes debt securities held by commercial banks. Since 2002 the Banca Naţională a României has participated in the IMF’s Co-ordinated Portfolio Investment Survey (CPIS) by surveying around 70 respondents (banks and insurance companies). The liability position includes equity securities and bonds and notes issued by all sectors.

Pure stocks of external liabilities in the form of bonds and notes are compiled using the DMFAS. Breakdowns by currency, sector, instrument, country, maturity and creditor are also available. Cumulative b.o.p. flows provided by the National Securities Commission are used for equity securities.

Balance sheet data are available one month after the end of the reference period and the cumulative b.o.p. figures are available two months after the reference period. DMFAS data are provided two to three months after the end of the reference period.
The coverage and concepts are in line with the definitions used in the financial account of the b.o.p.

The valuation criteria used for individual portfolio investment instruments is book value for equity securities and nominal value for debt securities.

14.1.4 FINANCIAL DERIVATIVES
At present, the i.i.p. does not include data on financial derivatives, which are only used on a very small scale.

14.1.5 OTHER INVESTMENT
The other investment position is compiled on a quarterly basis, including Romanian investment abroad and foreign investment in Romania. Residents’ assets include external medium and long-term claims, accounts receivable related to exports, credits extended by banks to non-residents, residents’ deposits abroad, capital subscriptions to international bodies and the balance on clearing accounts. Residents’ liabilities comprise short, medium and long-term commercial credits and loans, accounts payable related to imports, non-residents’ deposits, and the balance on clearing accounts.

External asset data are provided mainly by commercial banks, which record short, medium and long-term claims, accounts receivable related to exports, and the balance on clearing accounts. Breakdowns by country and maturity for external claims and by instrument for accounts receivable related to exports are also available. The pure stocks of currency and deposits of the banking sector abroad are derived from the balance sheets of commercial banks. Breakdowns by instrument and currency for commercial bank deposits are available.

Data on medium and long-term external loans and commercial credits received from non-residents are provided by the DMFAS. Breakdowns by currency, maturity, creditor, interest rate type and economic sector of the debtor are compiled on a monthly basis. Short-term liabilities of commercial banks are derived from balance sheet data.

Cumulative b.o.p. flows are used to obtain data for long-term export and import bills, such as letters of credit, cash against documents, letters of guarantee, etc., which reflect a claim on or a liability to an importer or an exporter of the non-banking sector, and credits extended by banks abroad.

The short-term external assets and liabilities of the banking sector and medium and long-term external loans are converted into euro at the end-of-period exchange rate. External claims are recorded at nominal value.

The capital subscriptions made to bodies like the World Bank, the EBRD, the IFC and MIGA have been removed from the portfolio investment position and classified as part of other investment (assets and liabilities). Data on capital subscriptions to international bodies are provided by the Banca Națională a României’s Monetary Policy Department and the MoPF. Breakdowns by instrument, currency and sector are available. Data for debt securities held by commercial banks are derived from their balance sheets.

The analytical accounts of commercial banks are generally available one month after the end of the reference period, while medium and long-term external debt and external claims data are available two months after the reference period.

The coverage and concepts are in line with the definitions used in the financial account of the b.o.p.

14.1.6 RESERVE ASSETS
Reserve assets are defined as gross claims on non-residents and comprise holdings of SDRs and foreign exchange, deposits at foreign banks and holdings of securities and Treasury bills issued by foreign governments.
Reserve assets are compiled and disseminated on a monthly basis. Breakdowns by currency and instrument are available.

The source of statistical data on reserve assets is the Banca Naţională a României’s balance sheet. The analytical accounts of the Banca Naţională a României and the monetary survey are generally available one month after the end of the reference month. The coverage and concepts are in line with the definitions used in the b.o.p. financial account.

In the i.i.p., end-of-period market price valuation is used for the Banca Naţională a României’s gold holdings and the valuation of foreign exchange is based on the relevant end-of-period exchange rate. Foreign securities held by the Banca Naţională a României are recorded at the original purchase price and holdings of SDRs are valued at the end-of-period USD/SDR exchange rate.

14.2 DEVIATIONS FROM AGREED DEFINITIONS

Taking into account the recommendations of the last IMF statistical mission (in August 2003), some reclassifications and changes were made in the i.i.p. reports.

In accordance with the SNA 93 and BPM5, the value of Romanian embassy buildings is treated as part of the country’s reproducible fixed capital rather than as external financial assets. This stock was removed from the other investment position.

The IMF quota subscription, which is denominated only in domestic currency, and the corresponding liability in the form of domestic currency deposit account at the Banca Naţională a României were excluded from the i.i.p. Consistent with BPM5 recommendations, only the reserve position in the Fund and the use of Fund credits are shown in the b.o.p. and i.i.p.

14.3 GAPS
None.

14.4 INTENDED HARMONISATION
None.

14.5 ESTIMATION METHODS
None.

15 CONTACTS

This country information was drafted by Romania in agreement with the ECB’s External Statistics Division. Enquiries of a general nature should be addressed to the Press and Information Division of the ECB. Enquiries specific to Romania should be addressed to:

Fax: +401 312 71 93  
E-mail: virgil.stefanescu@bnro.ro
The definitions of the terms included in this section are taken from the IMF Balance of Payments Manual (5th edition), the EMI’s Implementation Package or from reports prepared by the EMI’s Task Force on Financial Flows and Stocks, the forerunner of the ESCB’s Working Group on Balance of Payments and External Reserves Statistics. The terms are shown in alphabetical order.

**Accruals principle** – a method of continuous recording that matches the cost of capital with the provision of capital. This concept, which is broader than the actual payment of dividends and interest (on a cash or settlement basis), covers dividends due for payment, interest accrued, and unremitted profits (reinvested earnings) of direct investment enterprises.

**Balance of payments (b.o.p.)** – the statistical statement that systematically summarises for a specific time period (usually monthly, quarterly and/or annually) the economic transactions of an economy with the rest of the world. Transactions between residents and non-residents consist of those involving goods, services and income; those involving financial claims on and liabilities to the rest of the world; and those classified as transfers (such as gifts) which involve offsetting entries to balance – in an accounting sense – one-sided transactions.

**Bonds and notes** – these are securities issued with an initial maturity of more than one year which usually give the holder: (i) the unconditional right to a fixed monetary income or contractually determined variable monetary income (payment of interest being independent of the earnings of the debtor); and (ii) the unconditional right to a fixed sum in repayment of the principal on a specified date or dates.

**Capital and financial accounts** – the capital account covers all transactions that involve the receipt or payment of capital transfers and the acquisition or disposal of non-produced, non-financial assets, while the financial account covers all transactions associated with changes of ownership in the foreign financial assets and liabilities of an economy, including the creation/liquidation of claims on/by the rest of the world.

**Cash basis** – see accruals principle.

**C.i.f. (cost, insurance and freight at the importer’s border)** – valuation of the goods at the market value at the customs border of the economy into which they are imported, including in the import value the insurance and transportation costs.

**Credits and debits** – a credit in the b.o.p. records the provision of goods or services, a decrease in holdings of a financial asset or an increase in liabilities. Credits and debits form the two elements in the simple double-entry system used for recording the b.o.p.

**Current account** – the b.o.p. current account covers all transactions between resident and non-resident entities that involve economic values. Also covered are offsets to current economic values provided or acquired without a reciprocal exchange. The major classifications are goods and services, income and current transfers.

**Debtor/creditor principle** – foreign assets are geographically allocated to the country of the debtor (issuer), while liabilities are allocated to the country of the creditor (holder). This principle is the most appropriate choice if the interest concerns a change in the geographical distribution of the items on the nation’s balance sheet.

**Direct investment** – the category of international investment that reflects a lasting interest of a resident entity in one economy in an enterprise resident in another economy. The resident entity is the direct investor and the enterprise is the direct investment enterprise. The lasting interest implies the existence of a long-term relationship between the direct
investor and the enterprise and a significant degree of influence by the investor on the management of the enterprise.

**Direct investment enterprise** – an incorporated or unincorporated enterprise in which a direct investor, who is resident in another economy, owns 10% or more of the ordinary shares or voting power (of the incorporated enterprise) or the equivalent (of the unincorporated enterprise).

**Direct investors** – these may be individuals, incorporated or unincorporated private or public enterprises, associated groups of individuals or enterprises, governments or government agencies, or estates, trusts, or other organisations that individually own 10% or more of the ordinary shares or voting power of an incorporated enterprise or the equivalent of an unincorporated enterprise in economies other than those in which the direct investors reside.

**Directional principle** – the recording of direct investment flows according to the directional principle means, in general, that all capital transactions with foreign direct investment enterprises are recorded by the country of the direct investor as direct investment abroad; all capital transactions of resident direct investment enterprises with foreign direct investors are recorded by the country of the direct investment enterprise as direct investment in the reporting country. The status of the resident enterprise (i.e. direct investor or direct investment enterprise) in relation to its counterpart in the transaction is essential for the recording of direct investment flows.

**Enhanced Structural Adjustment Facility (ESAF)** – through the ESAF, the IMF provides assistance to low-income member countries at concessionary terms, in support of macroeconomic adjustment and structural reforms, to lay the basis for high and sustainable growth and external payments viability. This facility was replaced from 2000 onwards by the “Poverty Reduction and Growth Facility” (PRGF).

**Equity** – covers all instruments and records acknowledging, after the claims of all creditors have been met, claims to the residual values of incorporated enterprises. Shares, stocks, participation rights or similar documents (such as US Depositary Receipts) usually denote ownership of equity. Preferred stocks or shares, which also provide for participation in the distribution of the residual value of dissolution of an incorporated enterprise, are included, as are shares of collective investment institutions, e.g. investment funds.

**Euro area** – the area encompassing those Member States in which the euro has been adopted as the single currency in accordance with the Treaty establishing the European Community and in which a single monetary policy is conducted under the responsibility of the Governing Council of the European Central Bank (ECB). The euro area comprises Belgium, Germany, Greece, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal, Finland, and for statistical purposes, the ECB.

**Euro area assets** – this term means assets issued by non-residents of the Member States participating in the euro area which have been purchased and/or are held by euro area residents.

**Euro area liabilities** – this term means liabilities of euro area residents which have been purchased and/or are held by non-residents of the Member States participating in the euro area.

**European Central Bank (ECB)** – the ECB lies at the centre of the ESCB and the Eurosystem and has legal personality under Community law. It ensures that the tasks conferred upon the Eurosystem and the ESCB are implemented either through its own activities or through those of the national
central banks, pursuant to the Statute of the European System of Central Banks and of the European Central Bank. The ECB is governed by the Governing Council and the Executive Board, and, as a third decision-making body, by the General Council.

**European System of Central Banks (ESCB)** – the ESCB is composed of the ECB and the national central banks of all 15 EU Member States, i.e. it includes, in addition to the members of the Eurosystem, the national central banks of the Member States which have not yet adopted the euro.

**European System of Accounts 1995 (ESA 95)** – a system of uniform statistical definitions and classifications aimed at achieving a harmonised quantitative description of the economies of the Member States of the European Union. The ESA 95 is the Community’s version of the world System of National Accounts 1993 (SNA 93). The ESA 95 replaced the ESA 79 and its implementation began in the course of 1999 in accordance with Council Regulation (EC) No. 2223/96.

**European Union (EU)** – comprises the Member States of the EU and the EU institutions. All EU institutions besides the ECB are considered non-euro area resident units.

**European Union Member States (EU Member States)** – Belgium, the Czech Republic, Denmark, Germany, Estonia, Greece, Spain, France, Ireland, Italy, Cyprus, Latvia, Lithuania, Luxembourg, Hungary, Malta, the Netherlands, Austria, Poland, Portugal, Slovenia, Slovakia, Finland, Sweden and the United Kingdom.

**Eurosystem** – comprises the ECB and the national central banks of the Member States which have adopted the euro in Stage Three of EMU (see also euro area). There are currently 12 national central banks in the Eurosystem. The Eurosystem is governed by the Governing Council and the Executive Board of the ECB.

**Financial derivatives** – financial instruments that are linked to a specific financial instrument, indicator or commodity, and through which specific financial risks can be traded in financial markets in their own right.

**F.o.b. (free on board at the exporter’s border)** – valuation at the market value of the goods at the customs border of the economy from which they are exported, excluding the respective insurance and transportation services incurred.

**General Arrangements to Borrow (GAB)** – the General Arrangements to Borrow enable the IMF to borrow specified amounts of currencies from 11 industrial countries or their central banks, under certain circumstances, at market-related rates of interest.

**Goods** – this item covers general merchandise, goods for processing, repairs on goods, goods procured in ports by carriers and non-monetary gold.

**International investment position (i.i.p.)** – the statistical statement of the value and composition of the stock of an economy’s financial claims on the rest of the world, and of an economy’s financial liabilities to the rest of the world.

**Investment income** – incorporates income derived from a resident entity’s ownership of a foreign financial asset (credits) and, symmetrically, income derived from a non-resident entity’s ownership of a domestic financial asset (debts).

**Loans/currency and deposits** – comprise transactions in the following financial instruments: loans, i.e. those financial assets created through the direct lending of funds by a creditor (lender) to a debtor (borrower) through an arrangement in which the lender either receives no security evidencing the transactions or receives an effectively non-negotiable document or instrument; deposits; repo-type operations; and currency. Included are, inter
alia, loans to finance trade, other loans and advances (including mortgages). In addition, financial leases are covered.

**Money market instruments (MMIs)** – securities issued with an original maturity of up to one year. They generally give the holder the unconditional right to receive a stated, fixed sum of money on a specified date. These instruments are usually traded, at a discount, in organised markets; the discount is dependent upon the interest rate and the time remaining to maturity.

**New Arrangements to Borrow (NAB)** – the New Arrangements to Borrow became effective on 17 November 1998. They are a set of credit arrangements between the IMF and 25 member countries and institutions to provide supplementary resources to the IMF to forestall or cope with an impairment of the international monetary system or to deal with an exceptional situation that poses a threat to the stability of that system. The NAB do not replace the existing General Arrangements to Borrow (GAB), which remain in force.

**Other assets/other liabilities** – sub-item of other investment which covers all items other than trade credits, loans and currency and deposits.

**Other investment** – the residual category of the b.o.p. which therefore includes all financial transactions with non-residents not covered in direct investment, portfolio investment, financial derivatives or reserve assets.

**Other services** – those service transactions with non-residents which are not covered under transportation and travel, such as communications services, construction services, insurance or financial services.

**Portfolio investment** – this covers investment in equity securities (quoted shares) and debt securities (bonds and notes, and money market instruments). Excluded are any of these instruments which are included in direct investment or reserve assets.

**Poverty Reduction and Growth Facility (PRGF)** – See Enhanced Structural Adjustment Facility (ESAF).

**Real-time gross settlement (RTGS) system** – a settlement system in which processing and settlement take place on an order-by-order basis (without netting) in real time (continuously). See also TARGET.

**Reinvested earnings** – appear in the context of income on direct investment. They are defined as the direct investor’s share of the total consolidated profits earned by the affiliated company in a certain period (after allowing for tax, interest and depreciation) less dividends due for payment in the relevant period, even if these dividends relate to profits earned in earlier periods.

**Reserve assets** – consist of those external assets that are readily available to and controlled by monetary authorities for direct financing of payments imbalances, for indirectly regulating the magnitude of such imbalances through intervention in exchange markets to affect the currency exchange rate, and/or for other purposes. Reserve assets of the euro area are foreign (i.e. non-euro area) currency-denominated claims on non-euro area residents which are held by the Eurosystem.

**Residents** – these comprise the general government, individuals, private non-profit making bodies serving households, and enterprises, whose centre of economic interest lies within the territory of a given economy.

**Services** – consist of transportation, travel and other services.

**Settlement basis** – the recording of flows according to payments.
Statistics Committee (STC) – an ESCB committee which assists in collecting the statistical information necessary for the performance of the ESCB’s tasks, in harmonising the rules and practices governing the collection, compilation and distribution of statistics within its field of competence and in developing and implementing ESCB-wide statistical IT applications.

System of National Accounts of the United Nations (SNA 93) – this is the international standard for a comprehensive and systematic framework for the collection and presentation of the economic statistics of an economy. It encompasses transactions, other flows, stocks, and other changes affecting the level of assets and liabilities from one accounting period to another. These guidelines have been produced under the joint responsibility of the United Nations, the IMF, the Commission of the European Communities, the OECD and the World Bank.

Trade credits – consist of claims and liabilities arising from the direct extension of credit by suppliers and buyers for goods and services transactions and advance payments for work that is in progress (or to be undertaken) and associated with such transactions.

Trans-European Automated Real-time Gross settlement Express Transfer system (TARGET) – a payment system composed of one RTGS system in each of the 15 EU Member States and the ECB payment mechanism. The domestic RTGS systems and the ECB payment mechanism are interconnected according to common procedures to allow cross-border transfers throughout the EU to move from one system to another.

Transaction – an economic flow that reflects the creation, transformation, exchange, transfer or extinction of economic value and involves changes in ownership of goods and/or financial assets, the provision of services, or the provision of labour and capital.

Transactions basis – the recording of flows according to the change in ownership and not according to settlements. In the context of securities, the term “transactions basis” is identical to “accruals principle”.

Transactor principle – this principle allocates a transaction between a resident and a non-resident to the country of the direct counterparty to the transaction. The transactor principle provides information on the immediate direction of flows resulting from international settlements.

Transportation – covers all international transportation services (sea, air and other – including land, internal waterway, space and pipeline) that are performed by residents of one economy for residents of another economy and that involve the carriage of passengers, the movement of goods (freight), rentals (charters) of carriers with crew, and related supporting and auxiliary services. Excluded are passenger services provided to non-euro area residents by euro area carriers within the euro area economies, or vice versa (these are included under travel).

Travel – comprises the goods and services that travellers consume from one economy during visits of less than one year to that economy. It differs from other components of services in that it is a demand-oriented activity. Thus, unlike other services, travel is not a specific type of service, but an assortment of services consumed by travellers.

Working Group on Balance of Payments and External Reserves Statistics (WG-BP&ER) – reports to the Statistics Committee on matters relating to b.o.p./i.i.p. statistics.
